1865:																
14 April -	Belfast and County Down.	-	-	-	1	-	-	-	-	-	-	-	-	-	-	Female passenger attempting to get out of a train in motion at the Ballynahinch Junction Station, fell between the platform and the carriage. Arm lacerated.
11 July -	- ditto - - -	-	-	-	1	-	-	-	-	-	-	-	-	-	-	Passenger attempting to get into a train in motion at the Newtonwards Station, fell between the carriages. Foot had to be amputated.
22 April -	Belfast and Northern Counties.	1	-	-	-	-	-	-	-	-	-	-	-	-	-	Passenger leaning out of a carriage window when the train was leaving Cookstown Station killed, from his head coming in contact with the pillar of an arch, which was only 5½ inches from the window. The Company have, since the accident, widened the arch.
30 Aug. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Goods porter killed from being struck by a log of timber which he was moving.
28 Sept. -	Dublin and Drogheda	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Labourer in service of Company run over and killed whilst incautiously walking on the line near Dublin Station.
25 Mar. -	Dublin, Wicklow, and Wexford.	-	1	-	-	-	-	-	-	-	-	-	-	-	-	Collision. A passenger train ran into a train of empty waggons which was standing at the Bray Station. One passenger was cut on the face. The Company state that the accident happened through the neglect of the driver of the passenger train in running past the "danger" signal.

1865: 23 April -	Dublin, Wicklow, and Wexford— <i>contd.</i>	-	1	-	-	-	-	-	-	-	-	-	-	-	-	First class carriage of a passenger train got off the rails at Bray Head. One passenger slightly injured.
11 May -	- ditto - - -	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Spring of engine of a passenger train broke when near Sandy Cove Station, throwing the engine off the rails. No person injured.
17 Nov. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Breaksman run over and killed in getting off an engine in motion, at Harcourt-street Station.
26 April -	Great Southern and Western.	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Labourer on line run over and killed from his own want of caution.
6 June -	- ditto - - -	-	-	-	-	-	-	-	-	-	-	-	-	1	-	Pig-drover incautiously sitting on the rail of a waggon in which his pigs were being conveyed, fell off and was killed.
4 Sept. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Porter at Charleville Station run over and killed whilst incautiously shunting cattle trucks.
13 Dec. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Fireman fell from his engine at the Thurles Station, and was so severely injured that death ensued.
12 May -	Irish North Western	-	-	-	-	2	-	-	-	-	-	-	-	-	-	Goods train, from some unknown cause, left the rails about 1½ miles from Enniskillen. Driver and fireman killed.
9 May -	Midland Great Western	-	-	-	-	-	-	-	-	-	-	-	-	-	-	Carriage got off the rails near the Woodlawn Station, owing to the breaking of a wheel. No person injured.
7 Oct. -	- ditto - - -	-	5	-	-	-	7	-	-	-	-	-	-	-	-	Collision on the incline near the Kilcock Station, between a passenger train and some runaway empty waggons which were detached at the station from a coal train. Five passengers, and seven labourers in the employment of the Company injured, but none severely.
30 Oct. -	- ditto - - -	-	1	-	-	-	-	-	-	-	-	-	-	-	-	The 7.30 P.M. passenger train from Dublin thrown off the line near Castletown, owing to six of the screws and bolts of a rail having been maliciously removed, and the rail displaced. The Company state that they have offered a reward of 100 <i>l.</i> for the discovery of the offenders. One passenger injured.
26 Mar. -	Ulster - - -	-	-	-	-	-	-	-	-	-	-	1	-	-	-	Trespasser run over and killed.
18 June -	- ditto - - -	-	-	-	-	-	-	-	-	-	-	1	-	-	-	Trespasser killed at Contyclay, on Portadown, Dungannon, and Omagh Section.
16 Sept. -	- ditto - - -	-	-	-	-	1	-	-	-	-	-	-	-	-	-	The daughter of the gatekeeper at Kilmacardle Level Crossing killed. The gates were burst open by an engine, and a splinter struck the deceased, inflicting such severe injuries that death ensued.
21 Sept. -	- ditto - - -	-	-	-	-	-	-	-	-	-	-	1	-	-	-	Trespasser run over and killed whilst lying on the line near Dungannon.
8 July -	Waterford and Lime- rick.	-	-	-	-	-	-	-	-	-	-	-	1	-	-	Boy six years old trespassing among waggons, had his leg cut off by one of the wheels.
10 July -	- ditto - - -	-	-	-	-	-	-	-	-	-	-	1	-	-	-	Trespasser run over and killed whilst lying on the line at Ballinva.
28 Oct. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Fireman of goods train, from his own want of caution, fell from his engine, and was killed.
23 Nov. -	- ditto - - -	-	-	-	-	-	-	1	-	-	-	-	-	-	-	Fireman fell from train near Limerick whilst incautiously standing on the foot-board supplying oil to the engine whilst the train was in motion, and was killed.

PART II.

T R A F F I C, &c.

RETURNS by the several RAILWAY COMPANIES and other PROPRIETORS of RAILWAYS in ENGLAND and WALES, SCOTLAND, and IRELAND, showing the TRAFFIC upon their respective RAILWAYS in PASSENGERS and GOODS during the YEAR ended 31st December 1865.

THE Traffic Returns, which used formerly to be furnished to the Board of Trade by the several Railway Companies of the United Kingdom, in pursuance of the provisions of the Act 3 & 4 Vict. c. 97., are now obtained under Orders of the two Houses of Parliament.

In order to prevent reduplication in the mileage, each Company was directed, in returning the "Length of Line open," to exclude the length of those lines belonging to other Companies, over which the Company making the Return had merely "Running Powers," but to include half the length of "Joint Lines."

As it had been ascertained that no uniform rule had been adopted in the method of returning the number of passengers conveyed, each Railway Company was requested to count Return Tickets as two passengers, and children as whole passengers.

In order that the average fares per mile might be calculated in an uniform manner, the Companies were instructed to calculate them on the following principle:—"Divide the total obtained by adding together the ordinary fares for the *single* journey from either terminus of the line to every station on the line (including branches) by the total obtained by adding together the distance (in miles) of such terminus from each station."

The same instructions were given in respect of the express average fares for the *single* journey, in which case only the stations at which the express trains stop were to be counted.

All "Steam Boat," "Canal," and "Harbour" expenses were directed to be excluded.

It is to be understood that the responsibility for the correctness of the figures in this Return rests upon the different Railway Companies.

The Cork and Kinsale Company have made no Return of Traffic for 1865.

PART III.

WORKING EXPENDITURE, &c.

RETURNS by the several RAILWAY COMPANIES and other PROPRIETORS of RAILWAYS in ENGLAND and WALES, SCOTLAND, and IRELAND, of their respective WORKING EXPENDITURE during the YEAR ended 31st December 1865, and of the whole of the ROLLING STOCK of the several RAILWAY COMPANIES and other PROPRIETORS of RAILWAYS.

For the guidance of the various Railway Companies, and to ensure uniformity in the information given in the accompanying Return, each Company was directed, in making up the "Length of Line open," to exclude the length of those lines over which the Company making the Return had merely "Running Powers," but to include half the length of "Joint Lines;" and in returning the sums paid as "Compensation for Personal Injury, &c.," and "Compensation for Damage and Loss of Goods," to exclude the "Legal Expenses" connected therewith. Such "Legal Expenses," it was stated, should be included under the head of "Legal and Parliamentary Expenses." In the case of "Scotch Railways," it was requested that "Feu Duties" might be included under the head of "Miscellaneous."

The Companies were also directed to include in their Returns the sums paid out of "Renewal Account" or "Reserve Fund" of any kind, and to state the amounts so paid under the several heads to which they were applicable, but to exclude "Interest on Loans."

All "Steam Boat," "Canal," and "Harbour" Expenses were directed to be excluded.

It is to be understood that the responsibility for the correctness of the figures given in this Return rests with the several Railway Companies.

ENGLAND AND WALES.

RETURN of the WORKING EXPENDITURE and ROLLING STOCK of each RAILWAY COMPANY in ENGLAND and WALES during the YEAR ended 31st December 1865.

NAME OF RAILWAY COMPANY.	Length of Line open on 31st Dec. 1865.	WORKING EXPENDITURE during the Year ended 31st December 1865 (exclusive of all Steam Boat, Canal, and Harbour Expenses). RAILWAYS.

I.

RETURN, by the Board of Trade, of the Number and Nature of the ACCIDENTS and the INJURIES to LIFE and LIMB which have been reported to the Board of Trade, during the Year ended 31st December 1865.

II.

RETURNS, by the several RAILWAY COMPANIES in *England and Wales, Scotland, and Ireland*, showing the TRAFFIC upon their respective Railways in Passengers and Goods, during the Year ended 31st December 1865, &c.

III.

RETURNS by the several RAILWAY COMPANIES of the WORKING EXPENDITURE, &c., during the Year ended 31st December 1865, &c.

IV.

RETURNS by each RAILWAY COMPANY of their authorised SHARE and LOAN CAPITAL, and of the SUMS Received in respect of their ORDINARY CAPITAL, &c., on 31st December 1865 :—RETURN of any AMALGAMATION, WORKING ARRANGEMENT, &c. of RAILWAY COMPANIES carried into effect during the Year 1865, &c.

(*Mr Milner Gibson.*)

BLYTH AND TYNE RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 17th July, 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Blyth and Tyne Railway Company, the enclosed copy of the Report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 20th May last, on the North Seaton branch of the Blyth and Tyne Railway.

My Lords trust that the directors will take the steps recommended by Captain Tyler for preventing, in future, the occurrence of similar accidents.

I am &c.,

T. H. FARRER.

The Secretary of the
Blyth and Tyne
Railway Company.

SIR,

Sheffield, 6th July, 1865.

IN compliance with the instructions contained in your minute of the 31st May last, I have now the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 20th of that month, between a passenger train and a train of empty coal waggons, on the North Seaton branch of the Blyth and Tyne Railway.

The above branch is a single line two miles long, joining the main line at Bedlington. The North Seaton station, to which the branch is opened for passengers, is about a mile and five-eighths from the junction; and the branch is continued beyond North Seaton for about three-eighths of a mile, to a colliery. There is also a siding or mineral line, leading to a second colliery at East Sleekburn, near the middle of the branch.

There are eight passenger trains and from five to eight coal trains, running each way daily on the branch, the former according to published time-tables, and the latter according to circumstances, without any fixed times for arrival and departure. A market train, also, was (in May) in the habit of leaving North Seaton on Saturdays, in time to join the main line market train at Bedlington, though without any specified time for leaving North Seaton. This train had not run at all on two Saturdays during the past six months, when there were no passengers to travel by it; and on two other occasions the guard had run down with the engine only, to the junction.

The staff at Bedlington consists of a station-master, who has been there for a year and a half, and a lad, 19 years old, who acts as pointsman and takes charge of the station in his absence.

On Saturday the 20th May, a train consisting of engine and tender, and 48 empty coal waggons, without a break-van, left Blyth at 7.45 A.M., and passed the Bedlington junction at 8.25, on its way to North Seaton. The engine-driver found the signals and points at the junction all right for him to proceed, and he therefore went through to the branch without stopping. He knew that the market train would come from North Seaton to join the main line train due at the junction at 8.40, if there were any passengers for it; but he thought that if it did come he should be able to see it at a sufficient distance to enable him to get out of its way, and take

refuge in the East Sleekburn colliery branch. The line is quite straight, and he saw as he passed the junction to that branch that the train had not left North Seaton, and that the line was clear. He therefore proceeded forward for several hundred yards, until, when he was about 150 yards from the distant signal worked from the East Sleekburn junction towards North Seaton, he saw the market train start from that station. He did his best to pull up, and had almost brought his train to a stand, when the tender in front of the engine of the market train came into collision with his engine with considerable violence.

The buffer-beam and frame of the tender of the passenger engine were broken, the end of the tank was stove in, and the carriages were slightly damaged. The buffer-plate of the coal engine was bent, and the timber work of one (chaldron) waggon was destroyed. The six passengers who travelled in the market train were all injured, and two of them, females, unfortunately had their legs broken.

This passenger train consisted, in the following order, of a tender, an engine, a composite carriage, and a third-class break carriage. When it started at 8.30 from North Seaton, the station-master, the engine-driver, the fireman, or the guard, might, any of them, if they had taken the trouble to look, have seen the coal train approaching the station in the opposite direction. But the station-master was in his office "booking a few parcels"; the guard gave the engine-driver a signal to start without looking down the line; and the engine-driver, who has been dismissed from the Company's service, and whom I had no opportunity of examining, is said to have been drinking. The guard observed the coal train almost immediately after they had started, and he applied his break and kept it on until the collision occurred. He also endeavoured to attract the attention of the engine-driver, but he failed to do so; and it appears from his statement, as well as from that of the driver of the coal train, that the steam was not shut off from the passenger engine until it was within 20 or 30 yards of the coal train, when the passenger driver first showed himself and became aware of his danger.

This branch was opened for passenger traffic in 1860, and the Company then gave an undertaking under their seal, and signed by Mr. Joseph Laycock, the chairman, to the effect that only one engine in steam, or two or more engines coupled together, should be between North Seaton and the East Sleekburn junction, and between that junction and the Bedlington junction, at the same time.

But no regulations, special or otherwise, have ever been issued with a view to the carrying out of this undertaking, or to the safe working of the branch, and the servants of the Company have laid down such simple rules as they thought proper for their own guidance. The engine-driver of the coal train says, "My rule is, not to go on the branch within a quarter of an hour of the time for a passenger train to leave North Seaton." The Bedlington station master and his "pointsman" agree that a coal train ought not to be allowed to leave Bedlington for North Seaton in less than *ten minutes* from the time at which a passenger train is due to leave North Seaton for Bedlington; and it is their practice, they say, not to allow coal trains to go upon the branch within 20 minutes of the time that a main line passenger train (which a branch train has to meet) is due at

Bedlington. This practice was not strictly adhered to on this occasion, on account, apparently, of some uncertainty in the minds of the engine-driver of the coal train, and of the Bedlington pointsman, as to the running of the market train from North Seaton; and the above rules could not, indeed, be satisfactorily applied, because, as I have already stated, the market train had no specified time for starting.

The different circumstances of this accident afford an instance of the carelessness and recklessness with which the inferior officers and servants of a railway company may work the traffic, even of a single line, if they are allowed to do it in their own way, and without the check of good regulations strictly enforced. It was sufficiently strange that the engine-driver of the coal train should enter, and should be permitted to enter, on the branch at Bedlington, when he was, to say the least of it, so likely to meet the passenger train from North Seaton; but it was still more strange that a half-drunken engine-driver should be permitted to start in broad daylight from North

Seaton when the coal train could plainly be seen approaching it in the opposite direction; that the station-master in charge of the passenger terminus of the single line at North Seaton, should exercise no vigilance to prevent it; that the guard should give the signal for it; that the engine-driver himself and his fireman should both be so utterly regardless of their own safety and that of their train as never once to look before them, to see whether the line was clear, until they were close upon the coal train.

I recommend that a telegraph be now supplied on the line for convenience in working the traffic; that the train staff and ticket system, as was contemplated by the officer who inspected the line in 1860, be adopted for securing safety on the single line; and that a break-van be employed in future with the mineral trains.

I have, &c.,

*The Secretary to the
Board of Trade,
Whitehall.*

H. W. TYLER,
Capt. R. E.

BLYTH AND TYNE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 30th January 1866.*

SIR, I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Blyth and Tyne Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the explosion of the boiler of a locomotive engine at the New Bridge station of the Blyth and Tyne Railway on the 15th ultimo.

I am, &c.

W. D. FANE.

*The Secretary of the
Blyth and Tyne Railway
Company, Newcastle.*

SIR, 1, Whitehall, 26th January 1866.

IN compliance with the instructions contained in your minute of the 1st instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 15th December last, at the New Bridge station on the Blyth and Tyne Railway, at Newcastle, from the explosion of a locomotive engine.

James Whitehead, driver, and Robson Heppel, fireman, left Newcastle at 6.10 a.m. on the day in question, with No. 25 engine, for the Gosforth Colliery, from whence they brought 17 loaded chaldron waggons, reaching Newcastle again at 7.20. They shunted about the yard until the 7.30 passenger train had started, and then went to the depôts close at hand, to place the waggons over the coal-drops. They first took 6 waggons into the coal-drop siding, and then returned for the remainder; and when the engine had been standing still for about a minute and a half it exploded.

The engine-driver and fireman had got off the engine, and were standing on the left side abreast of the foot-plate; and the guard was 6 or 7 feet in front of them. The guard was thrown down several yards from where he stood, and scalded in the face, but was not much hurt. The engine twisted round, with its trailing end to the left, and fell on its left side. The engine-driver was blown under the tender, which was separated from the engine, and the fireman was blown round to the right of the engine, in front of the tender. They were both much scalded, and died the same evening, the driver at 8.10, and the fireman at 11.30.

The guard had ridden on the engine from Newcastle to Gosforth, and again, after returning to Newcastle, in going to the coal-drops. He states that the engine, which was working up to 120 lbs. of pressure, was blowing off slightly at the safety-valve when the explosion occurred.

No. 25 was a passenger engine, with leading wheels 4 feet 6 inches in diameter, and driving and trailing wheels, coupled together, 5 feet 6 inches in diameter. The wheel base measured 7 feet 7 inches from leading to driving, and 6 feet 8 inches from driving to trailing axles. The cylinders were 16 inches in diameter, with a stroke of 24 inches. The cylindrical part of the boiler, containing 140 tubes, was of $\frac{1}{2}$ -inch plates, and was 10 feet long by 3 feet 8 $\frac{1}{2}$ inches inside diameter. The firebox was 3 feet 4 inches wide at bottom, swelling out to 3 feet 7 $\frac{1}{2}$ inches at the top; 3 feet 10 $\frac{1}{2}$ inches long at bottom, and 3 feet 9 inches long at top; and 5 feet 4 inches high. The sides and back were of $\frac{7}{16}$ inch copper plates, and the iron plates of the shell of the firebox were also $\frac{7}{16}$ inch thick. The water spaces, back and front, were 3 $\frac{1}{2}$ inches, and the water spaces at the sides varied from 3 inches at bottom to 4 $\frac{1}{2}$ inches at the top. There were 117 stays, $\frac{3}{8}$ inch in diameter, in each side of the firebox, at central distances of 4 $\frac{1}{2}$ inches. There were 7 roof stays with nine $\frac{1}{2}$ inch bolts in each. A (Smith's) steam-gauge was attached to the boiler.

This engine was built by Messrs. Hawthorn and Co., of Newcastle, and delivered to the Blyth and Tyne Company in August 1862. It had run only 94,100 miles up to the time of the explosion. The last thorough repair that it underwent was in March 1865. At that time a new set of tubes was inserted, but nothing was done to the firebox, and the engine was tested with warm water up to a pressure of 180 lbs. A month before the explosion the engine was taken to the locomotive shops at Percy Main, on account of a leak on the right of the firebox, and the foreman boiler smith, John Bustin, then examined the firebox with a light inside, and tested it with a hammer. He "found the stays all good, except two or three broken, the plate worn, and the heads (of the stays) burnt down." He "put in 14 new stays, 4 under the fire-door, and 10 on the right side, but none on the left side, which did not so much require them." The engine was brought into the shops, also, two days before the explosion, in consequence of the fracture of a motion-bar bolt. A clamp was put on at that time, and the engine was sent out again to work temporarily until a new bolt could be inserted.

The explosion took effect on the left side of the firebox. The copper plate on that side was torn off the stays, and blown out of the firebox to the right, as the engine turned over, for a distance of 10 yards, the fire and fire-bars having been blown out with it. About one-fifth of the upper plate was pulled off the roof, the screw-bolts which held it to the roof stays having been fractured, and a third of the back plate and a small portion of the front plate were displaced and doubled back at the same time. Three of the stays only on the left side were fractured, and an inspection of the remainder and of the broken plates left no doubt as to the cause of the explosion. The heads of the stays had been almost entirely burnt away on the left side of the firebox, and there was hardly anything left to resist the pressure of the steam against the plate on that side but the threads of the screws. The thinnest portion of the plate, barely $\frac{3}{16}$ ths of an inch, was not in the portion that first yielded, but at the back of the firebox. If the stays had been renewed, as they undoubtedly ought to have been, when the engine was brought to the shops for the examination and repair of the firebox about a month previously, the explosion would not have occurred. It

appears that the fuel which is used on this line contains a large proportion of sulphur, which causes the heads of the stays to burn off and the copper plates to burn away more rapidly than they otherwise would do. The foreman boiler smith considered, when he sent the engine out with a partial renewal of stays, that it would work for another month or so without a more extensive renewal; but he had no good excuse for doing so. The burning away of the heads of the stays is so simple and obvious a symptom of weakness, that no explosion from this cause ought, with common care and attention, to be permitted to occur. I would observe, in conclusion, that some additional records are required at the Percy Main works, inasmuch as there was no means of knowing, except from the memory of the foreman boiler smith, and from actual observation of the firebox, either the period or the extent of the repairs which had been done to it about a month before the explosion; and these two means did not afford precisely the same result.

I have, &c.

*The Secretary,
Board of Trade,
(Railway Department).*

H. W. TYLER,
Capt. R.E.

CALEDONIAN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 2nd November 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the careful consideration of the Directors of the Caledonian Railway Company, the enclosed copy of the report made by Capt. Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred to a passenger train at the Wemyss Bay station of the Greenock and Wemyss Bay Railway on the 16th September last.

I am at the same time to request that you will state as nearly as possible the number of persons, distinguishing passengers from servants of the Company, who were injured by the accident in question.

I have, &c.

*The Secretary of the
Caledonian Railway Company.*

W. D. FANE.

*Board of Trade
(Railway Department),
Whitehall, 27th October, 1865.*

SIR,

IN compliance with your minute of the 20th inst., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances, that attended the accident, that occurred at Wemyss Bay station, of the Greenock and Wemyss Bay Railway, on the 16th ultimo.

Several passengers were cut and bruised; the exact number has not yet been ascertained, but I was informed that none of them were severely hurt.

The Greenock and Wemyss Bay Railway, is worked by the Caledonian Railway Company. The gradients are heavy.

On the 16th September a train, consisting of an engine and tender, a guard's van, two first class, one third class, two first class, and four third class carriages, coupled in the order stated, left Bridge Street station, Glasgow, at 1.11 p.m.

One third class carriage in the centre of the train and the third class carriage at the tail of the train, were supplied with break power, but there was only one guard with the train, and he rode in the break compartment of the last carriage, when the train started.

The train left Glasgow one minute late. It left Inverkip station, which is about two miles from Wemyss Bay station, 7 minutes late, and it arrived at Wemyss Bay at 2.30 p.m., according to the station master's evidence, and at 2.32 p.m., according to the evidence of the driver and guard of the train. 2.25 p.m. is the time it is due to arrive at Wemyss Bay. It was therefore 5 or 7 minutes late at Wemyss Bay, according to whosever evidence is correct. I am inclined to trust that of the station master, and to think, that two minutes of the time lost in reaching Inverkip from Glasgow, was made up between Inverkip and Wemyss Bay.

The line falls on a gradient of 1 in 70 for a mile, as it approaches Inverkip station from Glasgow. Charles Watson, the driver of the passenger train that left Glasgow at 1.11 p.m., on the 16th ultimo, when he reached the top of the incline north of Inverkip, desired his fireman to go into the break van next to the engine tender, to work the break. He states, that he had been in the habit of sending him there, ever since there has been no second guard to the train.

The fireman was intended to remain in the guard's van, till the train reached Wemyss Bay, and he did so, but just after the train started from Inverkip, the guard (who had been in the hind carriage up to that station) came into the front van, where the fireman was.

The engine driver was ignorant of this change, and therefore he conceived, that he had two break carriages available for controlling his train, whereas he had only one.

The line from Inverkip towards Wemyss Bay is practically level for about half a mile. It then falls 1 in 69½ for about 1½ miles till it gets within 350 yards of the buffers at the end of the Wemyss Bay station.

For 250 yards from the buffers it is practically level, and the other 100 yards is on a gradient of 1 in 300.

The driver states that on the 16th ultimo he reached the top of the incline, next to the Wemyss Bay station, at a speed of about 20 miles an hour, that he shut off steam just before reaching the top of the incline, and put on his tender break when he had got about 100 yards past the top of the incline; that he reversed his engine when passing the hotel, about half a mile from the station, and put on steam, and then commenced to put sand on the rails, which were

slippery, in consequence of some showers that had fallen that morning.

He could not succeed in stopping his train, which ran into the station at a speed variously estimated at 7 to 10 miles an hour, and struck the buffers at the end of the station at a speed of 6 or 7 miles per hour. The stationary spring buffers were broken and the adjacent platform disturbed.

The buffers of the engine and the near buffer of the tender next to the engine, were broken.

The buffers of the van broke through the back end of the tank and the van rebounded about three yards, breaking its coupling. Its leading wheels were thrown off the rails.

The front panels of the first class carriage next to the van were broken.

The engine that drew the train was a single tender engine, with 16 in. cylinders and 20 in. stroke.

The driving wheels are 7 feet diameter, and carry about $11\frac{1}{2}$ tons.

The leading and trailing wheels are 3 ft. 6 in. diameter, and carry about 8 and $6\frac{1}{2}$ tons respectively.

The distance between the centres of the leading and driving wheels is 6 ft. 6 in., and between the driving and trailing wheels 7 ft.

The tender weighs about 14 tons, and the van next the tender between 8 and 9 tons.

It appears that James Currie (the guard of the passenger train), when leaving the break carriage at tail of the train, asked a watchman who is in the Railway Company's employment, and who came with him from Glasgow in the break compartment, to look after the break, and that the watchman nodded his head.

James Currie wished to go into the front van, as there was a great quantity of passengers' luggage to attend to and to get out for the steamers, as soon as he reached Wemyss Bay. He thought that he would have as much power to control the train when in the front van as in the last carriage, and that the watchman could do his duty; but he took no trouble to ascertain whether the latter was competent to do it. If he had asked him, he would have found out, that he was not, and had he required additional assistance, he might have obtained another guard at Port Greenock.

James Currie had not travelled before with the driver Watson, and he was not aware, that Watson was in the habit of providing for the working of the front break, by sending his fireman to do it.

James Currie states, that the speed of the train at the top of the incline next to Wemyss Bay, was greater than usual, that he thinks it was 25 to 30 miles an hour. The fireman thinks it was 25 miles per hour, but says he would not swear that it was not 35 or even 40 miles per hour.

It certainly appears to have been greater than usual, and greater than it should have been; but judging from the result of the collision, I believe that if the guard had remained in his proper place in the last carriage of the train, and had applied his breaks properly, the collision would have been avoided.

It is certain that the breaks attached to the last carriage were not properly applied. The watchman knew nothing about them, never having been employed as a breaksman, and though he gave the wheel a turn or two, he says that he knows, from trying other breaks since the accident, that he did not put them on properly on the 16th ultimo, and the station master at Wemyss Bay corroborates this evidence, as he perceived that the breaks of the back carriage were not on, as the train came in.

It appears that some passengers applied the breaks in the centre carriage, but this was probably only done at the last moment.

The custom of allowing passengers to ride in the break vans is very objectionable, as in playing with the breaks they may mislead the driver of the train.

The accident appears to have been caused by incautious driving between Inverkip and Wemyss Bay stations. The driver reached the top of the incline falling to Wemyss Bay station, at a speed that put the train beyond his control in descending the incline, or else he neglected to apply the means available to check that speed in proper time.

He was no doubt deceived by the want of a second break, which he considered that he had provided in sending his fireman into the front van, but he should not have parted with his fireman, who was required at his post on the engine, and would then have assisted the driver to manage the engine.

The guard Currie is also much to blame for leaving his post. Had he remained there, the accident would certainly have been mitigated, if not altogether prevented.

Charles Watson (the driver) states, that he has applied to the officers of the Caledonian Railway Company for a second guard. This is admitted; but the officers state that Watson's application referred to another part of the Wemyss Bay line. It appears to me, that no part of the line required it more, than the Wemyss Bay, portion and that two guards are certainly required to a train of nine carriages travelling over a line with such gradients.

The fact, that the engine driver habitually parted with his fireman, to fulfil the duties of a second guard proves, how much a second guard was required, and it further proves, how desirable it is for railway companies to adopt some system, by which the proper officers will become aware, of what goes on on the lines under their charge, be informed of all cases when drivers put their firemen to do guards' duties, and guards leave their posts to attend to passengers' luggage, thereby endangering the safety of the train.

The exact time of running between Inverkip and Wemyss Bay would have been satisfactorily ascertained, had the books for entering the times of the trains, which were provided by the company, and entrusted to the station master at Inverkip and to the guard Currie, been properly kept.

The station master's was evidently quite incorrect, and his excuse was, that the porters sometimes made the entries, and omitted to make them at the proper time.

The entry in Currie's book had evidently been corrected, and therefore no reliance could be placed in it.

When inspecting this line I omitted to remark the want of gradient boards; I recommend that they be supplied. Charles Watson was well acquainted with the gradients, having driven trains on this line since it was opened, but gradient boards are useful when new drivers come on the line.

I have, &c.

F. H. RICH,

Capt. R.E.

*The Secretary of the
Railway Department,
Board of Trade.*

*Caledonian Railway Company,
Secretary's Office,
Glasgow, 4th November, 1865.*

SIR,

I HAVE the honor to reply to your letter of the 2nd instant, accompanying copy of Captain Rich's report on the accident at Wemyss Bay on the 16th September, which shall be submitted to my Board of Directors.

About seventy-five passengers intimated that they were more or less hurt, but in many cases the evidences of injury were not very apparent.

Only one of the Company's servants was hurt.

I am, &c.

R. M. GIBSON.

*The Secretary,
Board of Trade,
Railway Department,
Whitehall, London, S.W.*

GREAT EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 4th August 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of the Directors of the Great Eastern Railway Company, the enclosed copy of Colonel Yolland's report on the circumstances connected with the accident on 1st July last to an express train between the Hethersett and Trowse stations, near Norwich.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Eastern
Railway Company.*

*Board of Trade
(Railway Department),
Whitehall, 31st July 1865.*

SIR,

I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 8th instant, the result of my inquiry into the circumstances which attended the accident that occurred to the 5h. Om. p.m. down express train from London to Norwich on the 1st instant, between Hethersett and Trowse stations on the Great Eastern Railway, when the whole train got off the line, and a lady and gentleman sitting on opposite seats in a first-class carriage came violently into contact with each other, and were somewhat hurt, and the fireman was also slightly hurt in jumping off from the engine into the river; but most fortunately no serious injuries were received by any of the passengers.

This train, consisting of engine and tender, eleven carriages, and three vans, left the Bishopsgate Street station 24 minutes late, in consequence of a great influx of extra traffic on the afternoon of that day, which prevented some of the trains that preceded the express train getting away at their proper time. The express train was, in addition, a heavy train, with an unusually large amount of passengers' luggage brought up at the last moment. It lost time on the journey up to and including the stoppage at Cambridge. From Cambridge to Ely it kept its proper rate of travelling, and it left Ely with five carriages and two vans, with one guard, 42 minutes late, and Wymondham, 10½ miles from Norwich, about 49 minutes late, having been detained there some short time in consequence of another train being ahead of it.

As the train passed under the viaduct which carries the Eastern Union branch over the Norfolk line between Wymondham and Norwich, about two and a half miles from Norwich, the driver felt what he describes as a "jerk," and the fireman as a "bit of a jump or jerk," and they both thought that some of the wheels of the engine had got off the rails, and when they were on the wooden viaduct that carries the line over the River Bure, 266 yards from the Eastern Union viaduct, the driver got on the step of the engine on the right side and saw that it was tearing up the down line by clearing the bridge of both the metals and the top wood work, knocking them away before it, and that all the wheels of the engine were then off the rails.

As soon as the engine driver felt the jerk, he says, he told his fireman to put on the break, and he sounded the whistle three times for the guard's break when he might have passed the Eastern Union viaduct some 50 yards. He says that he had shut off the steam some 10 yards before he got to the Eastern Union viaduct in order to stop at Trowse station, as an Eastern Union train running into the same station was then overdue, but which train, the driver said, was generally late.

The fireman, on the other hand, states that they usually shut off the steam in coming down the bank from Hethersett, and that they did so on that day, but put it on again at the usual place, some 300 or 400 yards before reaching the Eastern Union viaduct, but not to the same extent as before, as there was a train in front from Wymondham, and that as soon as they felt the "bit of a jump" the driver shut off the steam again, and sounded the whistle for the breaks.

The guard of the train, 10 years a guard, riding in the last van, with one carriage behind it, states that he heard the driver whistle when they were some 40 or 50 yards past the Eastern Union viaduct, that he only heard one whistle, but could not say that it was the whistle for the breaks, and he looked out as soon as he could to see if there was anything in front, but could not discover anything; that he felt the train slackening speed, and he immediately went to his break, but before he got it full on they were at the wooden viaduct, which is about 260 yards from the spot at which the jerk had been felt.

The engine ran over the wooden viaduct, about 76 yards in length, and stopped some 17 yards beyond it, foul of the main line, separated from the tender, which, however, was still connected to the break van behind it, and the whole of the rest of the vehicles of the train also remained coupled together; the guard's van and the last carriage are supposed to have kept on the rails, but the other carriages were off the rails, and from the evidence of some of the passengers I believe that many of them got off a short distance after the train had passed under the Eastern Union viaduct. The progress of the engine had been, I have no doubt, greatly retarded by the resistance it met with while tearing up the roadway on the wooden viaduct, and it carried one of the rails from the left side and south end of the viaduct with it, completely bent and doubled up, between the left leading wheel and the frame of the engine. The leading van and one of the carriages were also foul of the up line, and one of the carriages was lying over towards but not actually on its right side, and another inclining over but to a less extent.

The wooden viaduct referred to was not completely covered with planking, but the chairs were spiked down to 3-inch planks placed transversely about three feet apart fastened down upon longitudinal balks of timber. Some of the wheels of the other vehicles had run along these balks of timber after the railway had been torn up by the engine.

The engine driver, fireman, and guard of the train estimate the speed at the time it passed under the Eastern Union viaduct at 30 miles an hour, the driver and fireman think they were travelling slower than they usually do at that spot, the guard at about the usual speed, and the lady who was hurt and who was travelling in a first-class carriage, third from the tail of the train (Mrs. Dalrymple), thinks they were travelling at the usual speed, which she estimated at from 30 to 40 miles an hour, but nearer to 30 than to 40. Other passengers estimated the speed at 50 and 60 miles an hour between Wymondham and the spot where the accident happened, and they mentioned that considerable oscillation was felt.

I have been unable to ascertain the time at which the accident occurred; no servant of the Company nor any of the passengers whom I saw could give me the exact time, otherwise I should have been enabled to form an accurate opinion as to the average speed from Wymondham to the scene of the accident. The train is allowed 16 minutes from Wymondham to Trowse station, which is about one mile from Norwich station, including the time required for collecting the tickets at Trowse, and the distance is 9½ miles, and if that time is not exceeded it is quite certain that it cannot be done at an average speed

less than 40 miles an hour, in fact 42 or 43 miles an hour would probably be nearer the mark. The ground is favourable for running fast, and it is distinctly stated that when trains are late the drivers endeavour to make up a portion of the time lost.

The line falls for about half a mile before the viaduct under the Eastern Union Railway is reached at an inclination of 1 in 726, and from thence it rises for a short distance to the wooden viaduct over the River Bure at an inclination of 1 in 1466. At the Eastern Union viaduct, and for some distance on each side of it, it is on an easy curve of 80 chains radius, curving to the left in running towards Norwich.

The line had been relaid in March last, when all decayed sleepers were taken out, the wooden viaduct having been thoroughly repaired some six or seven years since.

The permanent way consisted of a single headed rail that weighs 65 lbs. per linear yard, in lengths of 21 feet, fastened into cast-iron chairs by wooden keys placed outside the rails. Four descriptions of chairs appear to have been made use of, respectively weighing 36, 26, 23, and 16 lbs. weight, but to judge from the number of chairs that were broken in this accident about one half the number would appear to be of the weight of 16 lbs. each. Eight sleepers were made use of, as a rule, for each rail's length, although I noticed when on the ground that this rule does not appear to have been strictly carried out. Again, the joints of the rails were intended all to be fished, but there were some exceptions in the portion of road between the Eastern Union and the wooden viaducts. The 36 lbs. chairs were used at the joints.

I was informed that the first traces of a wheel being off the line were found about seven yards on the Norwich side of the Eastern Union viaduct, where the mark of the flange of a wheel could be seen on the top of the right rail, and the chairs under each rail at the second sleeper from the joint were both broken. From these chairs forward, as far as the wooden viaduct, the whole of the chairs under the right rail were every one of them broken,—here and there the fish joints under the same line of rails were also broken—and I understand that this rail was displaced from the chairs and pushed outwards; some of these rails were also bent. Under the left line of rails nearly every chair up to the wooden viaduct was chipped, a few were broken, and in many instances the ends of the fish plate bolts had been shaved off, and some of the fish plates had dropped off, but the left rail itself was not disturbed.

As already stated, the whole of the rails on the down line on the wooden viaduct were torn up, and it is very remarkable that the engine and carriages should have kept so steadily to the line of rails, and not have diverged to the right or left, but that was probably mainly due to the line having been kept well boxed up with ballast.

From an examination of the wheels of the engine, I think it is quite clear that the leading wheels got off to the right, on the outside of the curve, as it passed from under the Eastern Union viaduct, and that by the right wheel of the engine striking the outside lip of the chairs under the right rail, or by the lateral pressure produced by travelling at considerable speed, every chair was broken, and the road burst open for the wheels of other vehicles to drop inside it. The tread of the left leading wheel evidently chipped the inside lips of the chairs under the left rail, and shaved off the bolts of the fished plates at the joints. A mark could be traced, when I was on the ground, where the flange of a wheel had mounted at an unfished joint, but which wheel had dropped inside the right rail, and had not passed over the rail. When the engine reached the wooden viaduct, it is quite possible that the oscillation caused by vehicles off the rails behind, or a less secure permanent way on the viaduct, caused it to be burst entirely open, and the other wheels of the engine then left the rails altogether.

When I examined the line on the 11th instant, the permanent way had been put in order, but proceeding backwards for some distance beyond the spot pointed out where the first mark of a flange on the top of the right rail could be seen, I found that the right rail had a cant of about two inches, and the gauge was somewhat tight to the extent of $\frac{6}{16}$ of an inch at some of the joints. But I was informed by the resident engineer, as well as by the inspector of permanent way, that it was considered on the Great Eastern Railway to be safer to keep the gauge somewhat tight on curves. I am unable to agree as to the propriety of this practice being adopted; if a tight gauge is to be adopted at all, it should be on straight lines, and there it is quite possible it might have the effect of diminishing the oscillation which frequently occurs at high speed.

The engine No. 54 which drew this train is a six-wheeled outside cylinder passenger engine, having 16-inch cylinders, 24-inches stroke, with the leading and trailing wheels of 3 ft. 7 in., and the driving wheels of 7 ft. 1 in. in diameter. The distance between the centres of the leading and driving wheels being 7 ft., and that between the driving and trailing wheels 8 feet.

				Tons. cwt. qrs.		
The weight on the leading wheels						
I am informed is	-	-	-	10	9	2
Ditto ditto driving ditto	-	-	-	11	2	0
Ditto ditto trailing ditto	-	-	-	7	15	0
Total				29	6	2

The engine was built by Messrs. Stothers and Slaughter of Bristol, and was delivered to the Great Eastern Railway Company on the 24th May 1864, and it had run up to the 1st July 52,964 miles. It was last in the workshops in March of this year for repairs to the "slide valves, clacks, motion bars, "springs, new driving spring, links and hangers, "link motion, connecting rods, one new driving and "two leading axle boxes, pistons and slight repairs "to fire box." The tires are of Krupp's steel. The leading wheels were turned up in September 1864, another pair in January 1865, and a third pair in May 1865.

When examined after the accident, the wheels of the engine were found true to gauge, but some of the plates in each of the springs were found broken when taken to pieces. The greater proportion of these broken plates were evidently very recently fractured, and these may be considered as resulting from the accident, but there were other fractures, which were not so recent.

Every other vehicle in the train was found to be more or less damaged, and the most surprising circumstance is how the passengers escaped from receiving injuries.

Considerable excitement existed in Norwich, in consequence of this accident, coupled with the fact that there had been other accidents to trains on the same line, and not very far from the same locality. The superintendent of the line, Mr. Robertson, explained that two accidents to goods trains had taken place during the present year, one in February, and the other in April, both arising from the breaking down of an owner's waggon in a goods train, on which occasions the road had been torn up, and the traffic temporarily worked on a single line of rails under proper regulations, but that only one passenger train had been delayed, and that one not above 15 or 20 minutes. He also stated that during the time he had been superintendent of the line (nine years), no other accident to a passenger train, except the present one, had occurred between Wymondham and Norwich. An opinion was also prevalent that the present accident was in some way connected with repairs to the line, and in consequence I made particular inquiries on the subject. The testimony is direct and positive that nothing whatever had

recently been done to the down line in the immediate vicinity of the Eastern Union viaduct, and the inspector and sub-inspector stated that the line at that part was in first-rate order at the time of the accident. I do not think that both doors of any of the compartments of any of the carriages were locked at the time. In this accident there does not appear to have been, according to the information supplied to me, any very prominent defect in the line or rolling stock which can be at once singled out as the whole and sole cause of the engine getting off the rails; and I think it must be attributed to the combined action of the defects to which I have alluded; viz., the tightness of the gauge, and the running at a high rate of speed with some plates of the springs of the engine broken.

The absence of a distinct whistle on the engine that could be sounded for the guard's break when required, is herein shown to be a serious defect. The guard heard a whistle but did not know for what purpose it was sounded, and he looked out of the window to ascertain; whereas, if there had been a break whistle as on many lines of railway, he would at once have put the break on when it was sounded for, and he might thus have contributed to the stoppage of the train; and if that train had been fitted with continuous breaks applied to several vehicles, instead of only one break to seven vehicles, it is more than probable that but little damage would have been done to the rolling stock.

I should be glad to hear that the Great Eastern Railway Company had determined to strengthen considerably the present permanent way on this portion of their line, which is much weaker than on any main line of railway out of London. Chairs of 16 lbs. weight are much lighter than are now laid down by this company, even in their new branch lines of railway.

In making this inquiry I had the advantage of being assisted by the Mayor of Norwich, who was present throughout, when the evidence was taken down, and who from his knowledge of the locality, and the reports in circulation, was enabled to bring out such facts as will, when known, probably diminish the excitement to which I have referred.

I would recommend that a copy of my report be sent for the information of his worship.

Many gentlemen also who were passengers in the train, including Lords Suffield and Stafford, were good enough to accompany me to the scene of the accident, and to give me what information they could on the subject.

I have the honour to be,

Sir,

Your most obedient Servant,

W. YOLLAND,

*The Secretary, to the Board of Trade, Colonel.
Board of Trade,
Whitehall.*

GREAT EASTERN RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 23rd September 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred to a passenger train between Bury St. Edmunds and Welnetham Stations, on the 19th ultimo.

It appears by that report that the embankment on which the accident occurred is one of those with respect to which Col. Yolland, in his report of the 4th August last communicated to the Directors of the Great Eastern Railway Company in my letter of the 7th August, had observed "the embankments will require to be carefully watched for some time, and they should only be run over at very moderate speed until they are properly consolidated;" that the train arrangements of the company are such as to render necessary a speed of about 25 miles per hour at the place in question; and that the speed of the train to which the accident happened must at the time of its happening have considerably exceeded that rate.

I am to request that the careful consideration of the Directors may be given to the report above referred to.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Eastern
Railway Company.*

SIR, *Dulwich, 18th September 1865.*

IN compliance with the instructions contained in your minute of the 6th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances that attended the accident that occurred on the 19th ultimo, between Bury St. Edmunds and Welnetham Stations on the Great Eastern Railway.

A train, consisting of a tank engine, one second, one first-class carriage, and a guard's van, coupled in the order given, left Marks Tey at 5.50 p.m. on the day in question. It was 10 minutes late in starting, and left Welnetham on its way to Bury 10 minutes late. Bury is $4\frac{1}{4}$ miles from Welnetham.

The line from Welnetham to Bury falls for the first two miles on a gradient which averages 1 in 106.

When the driver had got about one mile on the Bury side of Welnetham his engine began to oscillate. He states that he was travelling at the rate of about 25 or 30 miles per hour, and that he shut off steam.

The fireman, the guard of the train, and the station master at Sicclesmere Siding (which is about one mile and a half on the Bury side of Welnetham Station) estimate the speed at 30 to 35 miles an hour; and a platelayer, who was walking on the road close to the line, estimates it at 40 miles an hour.

It is probable that it was not less than 35 miles per hour.

When the train got about 800 yards on the Bury side of the Sicclesmere Siding the engine burst the road. It ran for about 100 yards on the ballast, breaking up the road completely, and then ran down the bank to the left, taking the carriages and van with it, and buried itself up to the foot plates in the ground at the bottom of the bank, which is about 6 ft. 6 in. high at the spot. The carriages were prevented from falling over by resting on the footboards, and the guard's van was thrown on its side.

There were twelve passengers in the train, and it is an extraordinary fact, that none of them are reported to have been hurt. The driver, fireman, and guard also escaped without injury.

I attribute their wonderful escape to the train being small, and the road having been so completely destroyed by the engine, that the speed of each vehicle of the train was gradually checked by running in the ballast, which was newly laid on, and therefore loose.

The engine that drew the train is an eight-wheeled tank engine, with outside cylinders.

The two front wheels are on a bogie frame; they are 3 ft. 7½ in. diameter and carry 8 tons 10 cwt. The next two pairs of wheels, which are coupled together and act as drivers, are 5 ft. 7 in. diameter. The first pair carry 10 tons 15 cwt. and the other pair 10 tons 4 cwt. The trailing wheels are 3 ft. 7¼ in. (similar to the leading wheels). When the engine is supplied with coal and water they carry 9 tons 4 cwt.

The line was inspected on the 3rd August. The inspecting officer reported "the embankments will require to be carefully watched for some time to come, and they should only be run over at very moderate speed until they are properly consolidated."

The line was opened for passenger traffic on the 9th ultimo. It was in charge of and maintained by the contractors. The Great Eastern Railway Company appointed permanent way inspectors to look after it, on the 14th. The inspector of the length on which the accident occurred visited it on the 15th ultimo for the first time, and found the rails down in holes, and the banks in rather bad order from the rain that had fallen.

He called on the contractor to put it to rights, and additional men were put on at once, and the same permanent way inspector states, that it got better every day, and by Friday evening, when he left for London, "the road looked pretty well."

The bank where the accident happened was one which had been complained of and ordered to be lifted, and the inspector, before leaving for London on the Friday, directed the contractor's timekeeper to be particular in looking after it on the Saturday during his absence.

The platelayers were engaged on Saturday in lifting the road, at the spot where the accident happened, and had completed their work and filled in the ballast. They subsequently lifted about three or

four lengths of rail a little nearer to Welnetham, and they state that after lifting it, they filled in the ballast roughly. The engine driver and fireman state that the sleepers were not covered with ballast, but were left exposed, which I believe was the case.

The engine, on reaching this place, burst the road to the right, breaking the outer lips of five chairs; the fastenings held on, and she then swerved to the left, breaking one rail on that side into five pieces. From this to where she buried herself in the ground the road was completely destroyed.

The accident appears to have been caused by too great speed over a new road, which had not been maintained as it ought to have been. It was left from the 4th to the 13th in the charge of the contractor. On the 15th an inspector appointed by the company examined it, and called on the contractor to put it to rights, but he left again on the 18th ultimo, recommending a part which appeared to him defective to the particular care of the contractor's timekeeper.

The platelayers left the work on Saturday afternoon in an incomplete state, without taking any precaution to warn drivers of trains that might be travelling over it.

The Great Eastern Railway Company allow 12 and 13 minutes for the trains to run between Welnetham and Bury, which are 4½ miles apart; the time, considering what is lost in stopping, may be considered as giving a speed of 25 miles per hour.

The driver, who was behind his time, made it 35 miles per hour, on a road which the inspecting officer recommended to be worked at "very moderate speed" and which appears to have had an insufficient staff to maintain it. The result is an accident of an alarming nature, fortunately without any serious consequences.

I have, &c.

*The Secretary
Board of Trade
Railway Department.*

F. H. RICH,
Capt. R.E.

GREAT EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 8th November 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the fatal accident to the driver and fireman of a pilot engine, from the engine getting off the rails when near Darsham Station, on the East Suffolk branch on the Great Eastern Railway, on the 26th September last.

My Lords trust that the recommendations of Captain Rich for adopting a better mode of fastening the rails on certain portions of their railway will receive the careful consideration of the Directors.

I have, &c.

*The Secretary of the
Great Eastern Railway
Company.*

W. D. FANE.

*Board of Trade
(Railway Department),
Whitehall, 31st October 1855*

SIR,

IN compliance with the instructions contained in your Minute of the 4th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances, which attended the accident that occurred on the 26th ultimo near

Darsham Station, on the East Suffolk branch of the Great Eastern Railway, when the driver and fireman of a pilot engine, received such injuries that they died some days afterwards.

The engine in question (No. 70) left Ipswich at 1.20 p.m. on the 26th ultimo, to return to Beccles. It had brought up a fish train on the evening previous, but was returning without a train.

The regulations of the Great Eastern Railway direct, that engines without a train shall not travel at a greater speed than 25 miles per hour.

According to the evidence of the signalmen and station master at Darsham, it appears that No. 70 engine, after stopping at Woodbridge 5 minutes, left that station at 1.45 p.m.; that it left Wickham Market Station at 2.20 p.m., having stopped there 10 minutes; that it left Saxmundham at 2.25 p.m., having stayed there 5 minutes, and passed Darsham without stopping at 2.28 p.m. There is no doubt, from the evidence of other witnesses, that the time given by the station master at Darsham is somewhat incorrect; and there is also a mistake in the time either at Wickham Market or Saxmundham. It appears certain that the driver stopped at Woodbridge and Wickham Market, where the signals were all right for him to pass, and where he had no business to stop. The signalman at the latter station states, that both driver and fireman went to the public house close by.

They were men of good character, and there is no evidence or reason to suppose that they were not perfectly sober; but it is probable that the driver would try to make up the time lost at the stations where he was not supposed to stop; and I believe,

from the state of the rails after the accident, as well as the distance traversed by the engine after she left the rails, that the speed at the time of the accident must have been considerably more than 25 miles per hour.

No. 70 is a tender engine. Her leading wheels are 3 feet 6 inches diameter, and carry 6 tons 10 cwt.; her driving and trailing wheels, which are coupled together, are 6 feet diameter, and carry 9 tons and 9 tons 1 cwt. and 3 qrs. respectively.

The distance between centres of leading and driving wheels is 5 feet 5 inches, and between driving and trailing wheels 6 feet 3 inches; her length over all is 20 feet 8 inches.

The cylinders are 15 inches, and the stroke 22 inches. It was built by Robert Stephenson and Co., and delivered to the Great Eastern Railway Company (then called Eastern Counties) on the 26th August 1846. In June 1859 it was rebuilt, with new barrel of boiler, new copper firebox, brass tubes, &c. It had run 279,170 miles up to that date, and from June 1859 to the day of the accident it had run 170,759 miles more.

It was a passenger engine till three months before the accident, when it was sent into the shops in consequence of the tubes leaking. After that it became a pilot engine, but continued to work one branch passenger train daily.

From its short wheel base, it would be liable to oscillate, when running at speed over a road that was not perfectly smooth, and from the light weight on the leading wheels, it would be apt to mount the rails if much oscillation took place. The station master at Darsham states, that on the 26th ultimo No. 70 engine passed that station at a speed of 25 to 26 miles per hour.

From Darsham the line rises on a gradient of 1 in 85 for about a mile. It then falls for about three quarters of a mile on the same gradient.

Just before reaching the bottom of this incline, the engine and tender left the rails on the off side of the down line. They travelled for about 70 or 80 yards on the ballast, bending several rails, breaking the chairs and trenails, and totally destroying the down road. The engine then swerved across the 6 foot on to the up road, which it also destroyed for about 30 yards, and then both fell over the bank, which is about 14 feet high at this place.

The engine lay on its side, with its axles almost perpendicular to the slope of the bank, and the smoke box and funnel rested on the top of a culvert. The tender was turned bottom upwards, close behind the engine. The unfortunate driver and fireman were partly held down by the engine screen and partly covered with

the coke, which was thrown over them as the engine and tender fell over. The fireman was soon got out, but the driver could not be got out for some time, and both were so dreadfully scalded by the steam from the pipe of one of the safety valves that was broken in the fall, that the driver died on the 30th ultimo and the fireman on the 9th instant. After the accident the wheels of the engine were found true to gauge, and one spring appeared to have a broken plate, till the engine was examined in the works, when four plates of the off-leading and four of the near trailing springs were found broken. Some of them were no doubt broken by the accident, but I am inclined to think that some were broken before. As the engine was left lying on the bank for some time after the accident, the fractures had all become rusty, and it is difficult to decide which were broken before and which were broken by the accident.

The permanent way consisted of a double headed rail weighing 70 lbs. per yard, fished and fixed with wooden keys in chairs. The intermediate chairs weigh 22 lbs. and the joint chairs 33 lbs. each. The chairs were fastened with trenails to transverse sleepers laid 3 feet apart.

The road had been more or less damaged by floods a short time before the accident, and ballast was being added where required.

A platelayer who was working on the 30th ultimo, at a place about 100 yards above where the engine left the rails, stated that the road was a little out of order.

The driver of No. 70, before dying, informed the doctor who attended him, that he was travelling at a speed of 25 to 30 miles an hour at the time of the accident, and he added, that he had been an hour coming from Ipswich.

If the latter statement, which coincides with the time given by the station master at Darsham, can be relied on, it would give a speed of about 37 miles per hour deducting the time lost in the three stoppages.

I consider that this unfortunate accident was caused by incautious driving over a road somewhat irregular from the floods which had covered it a short time pre- and that the trenail fastenings gave way as soon as the engine began to oscillate.

I would urge the desirability of the Great Eastern Railway Company adopting some more secure mode of fastening on all portions of their system where trenail fastenings (which are now generally admitted to be dangerous) still exist.

I have, &c.

F. H. RICH,
Capt. R.E.

*The Secretary of the
Board of Trade.*

GREAT EASTERN RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 23rd November 1865.*

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, to be laid before the Directors of the Great Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision that occurred at the Western Junction at Stratford Station on the Great Eastern Railway on the 2nd instant.

My Lords trust that the Directors will give the recommendations contained in the inspecting officer's report their careful consideration.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Eastern
Railway Company.*

SIR, *Dulwich, 16th November, 1865.*

IN compliance with the instructions contained in your minute of the 4th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended a collision between two passenger trains that occurred on the 2nd inst., near the Western Junction of the Stratford Station, on the Great Eastern Railway.

Twenty-four passengers have complained of contusions and of having been shaken, and one man's cheek-bone was broken.

There was a dense fog on the morning of the 2nd November, and consequently several trains were late in leaving Bishopsgate Station.

The Enfield train, which consisted of a tank engine, two vans, (one next the engine and the other at the tail of the train) four first-class, three second-class, and four third-class carriages, left Bishopsgate Station at 9.17 a.m., 14 minutes late. It travelled all right

as far as the distant-signal of the the Western Junction on the London side of Stratford Station.

The train was brought to a stand at the Western Junction distant-signal, as it exploded three fog signals which were placed on the rails to stop it, by a fog signal man stationed there for the purpose. The fog was so dense that the semaphore signals could not be seen except by a person close under them.

About 100 yards west of the Western Junction distant signal there is a telegraph station, called Bridge Box, with a signalman always stationed in it.

This man, having received the telegraph "line clear" from the signalman at the Western Junction, had given the "all right" signal to the Enfield train to pass his station, and though the train pulled up about three or four carriage lengths within his station, he could not see it, and was under the impression that it had passed on as he did not observe the three fog signals, which were exploded by it about 100 yards from his post.

Believing that the Enfield train had passed on to the Western Junction, and having a good deal to do with working his telegraph, as well as placing fog signals in accordance with the three semaphore arms at his post, he neglected to place more than one fog signal (which denoted all right) on the down line, when he received the telegraph, "line blocked" from the Western Junction.

The Norwich mail train, consisting of an engine and tender, a break van next to the engine tender, and one at the tail of the train, with a guard in each, and five composite carriages, which was due to leave Bishopsgate at 9.15 a.m., started eight minutes late. The driver got the "all right" signals at Devonshire Street, Old Ford, and Bow Station as he ran past, but, after leaving Bow, he fortunately slackened the speed of his train, to about seven miles an hour, and he arrived at the Bridge Box telegraph station at about that speed.

As he passed this box, his fireman observed the signal at danger, and the signalman was holding a red flag at the door, but before he had time to reverse his engine, he ran into the Enfield train, which was still standing close inside the Bridge Box Station.

No passengers in the Norwich train were injured and none of the vehicles were damaged. Several couplings of the Enfield train were unhooked and two were broken, but the only carriage injured was the van at the tail of the train; none of the vehicles in either train left the rails.

According to the printed instructions of the Great Eastern Railway Company it was the duty of the fog signal man stationed at the Western Junction distant signal, to have gone back 800 yards, and placed fog signals on the rails as soon as the Enfield train was stopped, but he considered that the train was protected by the Bridge Box telegraph signalman, close to whose box the tail of the train stood. The driver of the Enfield train wished to draw within the

signal, but the fog signal man would not let him, as the semaphore was at danger, and the fog was so dense that he could not see what was ahead.

It was also the duty of the guard in the rear van of the train, to have gone back at once with fog signals, and he ought certainly to have got as far as the Bridge Box Station, which was only three or four carriage lengths from his van.

It appears that the Enfield train had only stopped about two minutes, when it was run into. The guard in the front van was on his way to the rear to send the second guard back but had not reached him at the time of the collision. The second guard had only got about 20 yards from his van, when he heard the Norwich train whistling, and he had no time to take any means to prevent the collision.

The Cambridge line, from which the sidings to Stratford Yard branch, joins the Great Eastern Line to Colchester about 100 yards east of the Western Junction, which latter is the junction of the Woolwich lines. Both these junctions are worked on the locking principle, and the block system of telegraph is also in use.

The main line between the Western Junction and Stratford Station which is only about 200 yards long, is liable to be blocked by trains from Woolwich, Colchester, Cambridge, or Stratford Yard and Sheds.

It has been the custom for the Western Junction signalman to telegraph "line clear" to Bridge Box Station, when this interval is clear for trains from the west, even though the line be blocked close to the east of his box, by any of the above mentioned trains.

He used his distant-signal for protection in this latter case, but this distant-signal could not be seen by the man in the Bridge Box in a thick fog like that on the 2nd inst., and in any case the Bridge Box man's duties confined him to keep his post, and he could hardly have prevented the collision, even had he put down three fog signals as he should have done, instead of one.

I recommend that the distant signal at the London side of the Western Junction be moved close to the Bridge Box Station, and that in future the fog signal man stationed at it should be placed there as an assistant to the Bridge Box telegraph signalman, whose duties hardly admit of his attending personally to the fog signals.

It appears further desirable that the signalman at the Western Junction should work the telegraph in accordance with the signals, and not give "line clear", while he keeps his distant-signal at danger, thus giving the Bridge Box signalman contrary instructions, which would naturally cause him to take down his station signal, whilst the distant-signal close alongside would remain at danger.

I have &c.,

To the Secretary of the
Board of Trade,
Railway Department.

F. H. RICH,
Capt., R.E.

GREAT NORTHERN RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 14th August 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, in order that the same may be laid before the directors of the Great Northern Railway, the enclosed copy of the Report made by Capt. Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred on the 15th July last, near Peterboro', between a mixed goods and passenger train and a run-away engine.

The Secretary of the
Great Northern
Railway Company.

I am, &c.
W. D. FANE.

Board of Trade
(Railway Department),
Whitehall, 12th August 1865.

SIR,

In compliance with your instructions of the 28th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 15th July 1865, near Peterborough station, on the Great Northern Railway, where a goods train with two passenger carriages attached was overtaken and struck by a run-away engine.

About two miles to the north of Peterborough station there are large engine sheds and numerous sidings. This engine depot is called New England.

The connection between the numerous sidings at New England, and the main lines of the Great

Northern Railway, is formed by one line of rails communicating with the main up line to the south of New England, and one line of rails communicating with the main down line to the north of New England station, so that the points on the main lines are falling points in both cases.

These single lines of rails, which form the only communication between the New England sidings and the main lines, are further guarded by blind sidings, which run parallel to the main lines, and the points are always kept open for the blind sidings, so that no engine can get on to the main lines, unless allowed to enter by the signalman stationed at the points.

These single lines of rails which communicate with the sidings, join each other to the east of New England station, so that they form a triangle in connection with the main line, and thus enable engine drivers to turn their engines in the direction they wish to proceed, without using a turntable.

The arrangement is very good, and should have prevented such an accident as the one that occurred on the 15th ultimo, but the pointsman who was stationed at the south junction on that day was taken by surprise, lost his presence of mind, and directed the inspector at New England (who was standing at the points, waiting for an engine which he had ordered) to let the run-away engine on to the main line, which he unfortunately did.

The view from the signalman's box at the south end of New England yard, is confined by the boundary hedge of the railway, which has grown so high that the signalman cannot see from his box, whether the engines approaching him come from the sheds or from the line, which forms a side of the triangle round the yard.

Engine drivers wanting to pass on to the main line give three whistles, and if the signalman intends to let them pass, he lowers his signal and shifts the points to let them out. If he does not intend to let them pass, he allows the signal to remain on and leaves the points in their ordinary position, which leads to the blind siding.

Richard Tucker, the signalman on duty at New England south station on the 15th ultimo, was sent from King's Cross, London, on the 11th July, as the New England signalman was sick.

Tucker was an experienced man, whose office is to take the place of signalmen when any of them are sick. He had been signalman at New England about three years ago, and was perfectly acquainted with the station.

About 2.30 P.M. on the 15th ultimo, he heard three whistles from an engine in the New England yard. He left his box to lower the signal and let her out, but no engine appeared; so he put up the signal again and returned to his box. At 2.50 P.M. he again heard three whistles, from an engine at the coke stage, and he left his box, but returned without moving the points or lowering the signal.

As he returned to his box, the inspector and foreman of porters at New England, who were waiting for a goods engine which they had ordered, came to his post, and while Tucker was engaged with his telegraph instrument, the inspector called to him "What is this coming?"

He ran out and saw an engine within about 80 yards of his post, coming towards him at the rate of 20 miles an hour.

The inspector, who was expecting the goods engine that was ordered for him, and who heard three whistles from an engine at the coke shed, was standing at the lever handle of the points, prepared to let the engine out, and go on it to Peterborough. On perceiving No. 352 engine approaching at great speed with full steam on, and passing the signal that was up, he felt that there was something wrong, and imagined that one of the cleaners was bringing the

engine out, and that the regulator had got fast. He called to the signalman, "For God's sake, there is something wrong, where shall we turn it?" The signalman, seeing that it was a Peterborough engine, replied "Main line" or "Let her out," upon which he turned the points for the main line, instead of letting the engine go into the siding.

Owing to the hedge intercepting the view, the engine came suddenly on the men at the signal box, who, taken by surprise, became confused and let the engine on to the main up line, instead of turning it into the siding. It passed through Peterborough station at a speed of about 25 miles per hour.

A goods train, consisting of an engine and tender, 32 waggons, two break vans, and two passenger carriages attached to the tail of the train, behind the last break van, had left Peterborough station, on the up line, about four minutes before the run-away engine had passed through.

This train, which only carried passengers on market days, was run into by the run-away engine about $1\frac{3}{4}$ miles south of Peterborough.

About 20 to 27 passengers are reported to have received cuts and bruises more or less severe.

The end and bottom of the last passenger carriage were injured, and the buffer face and lead lamp of the run-away engine were broken. It was locked into the last passenger carriage attached to the goods train.

The driver of the goods train, who states that he was travelling about 20 miles per hour, felt a slight concussion and a jerk forward. On looking back he saw the passengers signalling to him, and he pulled up his train as soon as he could.

The inspector at New England had telegraphed to Peterborough as soon as the run-away engine passed him, and an engine and train which was standing in a siding at Peterborough was started in pursuit of the run-away engine a few minutes after it passed through the station. It came up opportunely, to take away the injured passengers.

The cause of the run-away appears to have been, that the fire lighter at New England, who is responsible that the tender breaks are hard on, that the regulator is shut, and that the engine is out of gear, before lighting the fire, neglected, by his own admission, to put No. 352 out of gear when he lighted the fire. He left the engine in forward gear, but states that the breaks were on and the regulator shut.

The washer out and the engine cleaner were also engaged on No. 352 on the day in question. The former admitted that he sometimes opened the regulator to allow the engines to fill more quickly with water, but denied doing so to No. 352 on the 15th ultimo.

There is no doubt that when No. 352 ran out of the engine shed, the breaks were not properly on, the regulator was open, and the engine was in forward gear.

There appears to be no reason to suppose that the engine was maliciously interfered with. The neglect lies, therefore, with these three men, all of whom had been dismissed from the Company's service, and did not attend to give me their evidence; but I was furnished with the statements which they made to the Company's officers.

It is desirable, that the hedge between the south signal box and the engine sheds at New England should be removed, and that the signal box should be raised 6 or 8 feet above the level of the ground. The Great Northern Railway Company had already ordered these works to be done when I visited the place.

I have, &c.

*The Secretary
Railway Department,
Board of Trade.*

F. H. RICH,
Capt. R.E.

GREAT NORTHERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 4th October 1865.*

Sir,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Northern Railway Company [Midland Railway Company], the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 30th August last, at the Colney Hatch station of the Great Northern Railway, between an excursion train of the Midland Railway Company and a coal train of the Great Northern Railway Company.

My Lords trust that the report will receive the careful consideration of the Directors.

The Secretary of the

Great Northern

Railway Company.

The Secretary of the

Midland Railway Company.

I am, &c.,

W. D. FANE.

*Sandown, Isle of Wight,
28th September 1865.*

Sir,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 2nd, the result of my inquiry into the circumstances which attended the collision that occurred on the 30th ultimo, at Colney Hatch station on the Great Northern Railway, between a Midland excursion train, and a coal train belonging to the Great Northern Railway Company.

A large number of passengers are stated to have received injuries more or less severe, and claims for compensation from 250 have been sent in, and it is feared that seven or eight passengers are somewhat seriously hurt.*

By agreement between the two Railway Companies the Midland Railway Company runs trains over the Great Northern Railway between Hitchin and King's Cross, a distance of 32 miles, and over this portion of the Great Northern Railway the traffic is worked with the assistance of the electric telegraph.

In 1856 the traffic was commenced to be worked on what is generally known as the block system, by which no two trains are permitted to be on the same line between two telegraph stations at one and the same time, and in the length between King's Cross and Hitchin there were 19 telegraph stations with telegraphic instruments at each to enable the progress of the various trains to be regularly signalled and the system carried out.

In 1860 this system was altered, and another substituted for it, and I enclose a copy of the "Instructions for signalling trains by the electric telegraph" now in use on the Great Northern Railway. They are not very intelligible, but, as far as I can make out from these instructions, the block system is entirely given up, and a following train may be allowed to proceed past a telegraph station when the preceding train has not reached the signal station in advance, or even when the signal "line blocked at that station" has been received; but the signalman must, in that case, caution the driver by word of mouth that a "train is ahead," or that the "line is blocked at the next station. And the drivers are also therein "prohibited from running at a higher speed than 15 miles an hour, on receiving a caution signal at one station, and until they receive an "all right" signal at another station." But I am told that the practice is to maintain the block system between telegraph stations where tunnels intervene; but it is certainly not expressed in these instructions.

* One has died subsequently to the date of this report of the injuries then received.

GREAT NORTHERN RAILWAY.

INSTRUCTIONS FOR SIGNALLING TRAINS
BY THE
ELECTRIC TELEGRAPH.

To ring the Bell, it is necessary to move the left-hand needle once in either direction.

Ring the Bell to call the attention of the Signalman at the next Station, who must also ring the Bell in return to show he is in attendance.

Then stand on the Box containing the Spring, and Telegraph in the following manner:—

No. 1.—PASSENGER TRAIN IN.—Point the left-hand needle at the word "In," printed on the instrument.

No. 2.—PASSENGER TRAIN OUT.—Point the left-hand needle at the word "Out."

No. 3.—GOODS, CATTLE, MINERAL, BALLAST TRAIN OR EMPTY ENGINE IN.—Point the right-hand needle at the word "In."

No. 4.—GOODS, CATTLE, MINERAL, BALLAST TRAIN, OR EMPTY ENGINE OUT.—Point the right-hand needle at the word "Out."

No. 5.—PASSENGER TRAIN BE READY.—Point the left-hand needle twice at the words "Be ready."

No. 6.—GOODS, CATTLE, MINERAL, BALLAST TRAIN OR EMPTY ENGINE BE READY.—Point the right-hand needle twice at the words "Be ready."

No. 7.—LINE BLOCKED AT MY STATION.—Point both needles at those words.

No. 8.—LINE CLEAR AT MY STATION.—Point both needles at those words.

No. 9.—TRAIN WAITING.—Point the left-hand needle once to the left and once to the right, forming the letter D.

No. 10.—IS A TRAIN WAITING?—Point the right-hand needle once to the left and once to the right, forming the letter M.

No. 11.—NOT UNDERSTAND.—Point the left-hand needle twice at those words.

No. 12.—No.—Point the right-hand needle four times to the left.

No. 13.—TRAIN NOT OUT.—Point the right-hand needle twice at those words.

In telegraphing the above signals, the needles must always be kept pointing for one-third of a minute.

None of the signals must be considered as understood until repeated by the signalman to whom they have been sent; and if they should be repeated incorrectly, the signalman who first sent the signal must immediately shake both needles several times backwards and forwards, and again give the signal, and until it is repeated correctly.

If either signalman receive a signal which he is not sure that he understands, he must give the signal No. 11 (Not Understand), in order that the signal may be repeated more distinctly.

Between WOODGREEN STATION and POTTERS' BAR STATION.

Between WELWYN STATION and KNEWORTH SIGNAL BOX.

Between STOKES TUNNEL SIGNAL BOX and GREAT PONTON STATION.

Between PEASCLIFFE TUNNEL SIGNAL BOX and BARKSTONE JUNCTION.

Being Stations where Tunnels intervene.

THE FOLLOWING REGULATIONS ARE RIGIDLY TO BE ADHERED TO

On and after Monday, 4th April, beginning at 12 o'clock mid-day.

1. The signalman must be on the look out for all trains, and as soon as a Passenger Train is in sight, if the line is clear, he will go to his signal, and when the engine has passed, he will show the Danger signal at the station and at the distant signal must along the line on which the train has passed; then immediately return to his instrument, and call the attention of the signalman at the station towards which the train has gone, by ringing his bell; and when this has been acknowledged, by the bell being rung in return, he will stand on the box containing the spring, and telegraph No. 1 (Passenger Train in), until he receives a repetition of the same signal from the signalman at the station to which he is telegraphing; he will remain at the instrument until his bell is rung, and he receives the signal No. 2 (Passenger Train out), which having repeated, he will then, *and not before*, lower the "Danger" signals, and show "All Right" along that line.

2. Goods, Cattle, Mineral, Ballast Trains, and Empty Engines must be telegraphed in the same manner with the right-hand needle, and the same signals shown after their passing.

3. The signals No. 2 (Passenger Train out), No. 4 (Goods, &c. out), must not be given until the train has passed the station, nor until a train that is stopping has again gone forward, except in case where one train is about to shunt for another to pass, when the signals Nos. (2 or 4) as the case may be, "Train out" and (No. 7) Line blocked at my station" must be given to the station from whence a train about to shunt has arrived, and as soon as it has stopped at the station, in order that a following train that may be waiting may come on at "Caution," as directed in clause 6, instead of waiting until the preceding train has shunted clear of the Main Line.

4. When three stations are in communication by this system of telegraphing, a signalman after receiving a signal from a station on one side of him that a train is "In," must at once call the attention of the signalman at the station on the other side of him, and give the signal No. 5 (Passenger Train be ready), or No. 6 (Goods, &c. be ready), as the case may be, that the station receiving such a message may be prepared for the arrival of the train.

5. When a signalman receives the signal No. 5 (Passenger train be ready), and a stopping Passenger Train, or a Goods, Mineral, or other slow train is at or approaching the station, the clerk in charge must at once be informed, in order that he may exercise his discretion as to shunting for the following train so signalled.

6. If it be necessary to obstruct the Main Line by moving a horse-box, truck, or other vehicle on to it (which must never be done after the receipt of the signals Nos. 1 and 3), the signals at the station and distant must first show danger, and the signal No. 7 (Line blocked at my station) must previously have been sent by the signalman to the next station when the train is about to approach, and will then show the Danger Signals, and allow no approaching train to pass from his station until the signal No. 8 (Line clear at my station) has been received, without having first shown a "stop" signal at the distant signal post and a "caution" signal at the station signal post, as directed below in clause 11. The signal No. 8 (Line clear at my station) must not be given until the obstruction, of whatever nature it may be, has been entirely removed.

7. If both Lines are obstructed the signal No. 7 (Line blocked at my station) must be sent to the stations on both sides.

8. If a train be waiting, and the signalman suppose the fact to be unknown at the other station, he can indicate it by giving the signal No. 9 (Train waiting), the answer to which will be signal No. 2 (Passenger Train out), No. 4 (Goods, &c. out), or No. 13 (Train not out), as the case may be.

9. Should a signalman want to ask if a train is waiting, he will give the signal No. 10 (Is a train waiting?), the answer to which will be signal No. 9 (train waiting), or signal No. 12 (No.).

10. All trains that have to wait for a signal must stand with the last vehicle clear of both signal masts, so as to be protected by them from any train or engine following; and on no account must any train or engine be allowed to proceed without the signalman on duty rings the starting-bell; but if an Up and a Down Train are in the station at the same time, the signalman must leave his box, and tell the guard of the train that should proceed that he may go on.

Between HOLLOWAY SIGNAL BOX and WOODGREEN STATION.

Between POTTERS' BAR STATION and WELWYN STATION.

Between KNEWORTH SIGNAL BOX and HITCHIN STATION.

Between STROKE TUNNEL SIGNAL BOX and ESSENDINE STATION

(Up Line only).—

Being Stations where Tunnels do not intervene.

The above Regulations are also rigidly to be adhered to, with the following exceptions only:—

11. In the event of a train or engine approaching a station before the preceding train has been telegraphed "Out," or when the signal No. 7 (Line blocked at my station) has been received, the signalman must keep his "Danger" signal shown, and the approaching train having pulled up at and passed within the distant signal, the station signal must immediately be placed at "Caution," and the train allowed to proceed. The signalman, in the event of the approaching train being timed to stop at his station, will not, however, stop it at his distant signal, but if the lines be clear into the station, will allow the train to enter, giving the driver a caution signal at his station semaphore. And if it is required to proceed before the signals No. 2 (Passenger Train out), No. 4 (Goods, &c.) out, and No. 8 (Line clear at my station), have been received, he must caution the driver by word of mouth that a "Train is ahead," or that the "Line is blocked at the next station."

Down Trains between Essendine and Stoke Tunnel will not be telegraphed on the Short "Circuit System," but on the Through Circuit, as per circular dated 4th April, 1864; and Down Trains must be signalled to stop, or allowed to pass on, in accordance with Rule 18, page 11, and Rule 22, page 13, of the General Regulations.

12. Drivers after receiving a caution signal at one station, are prohibited from running at a higher speed than 15 miles an hour until they receive an "All right" signal at another station, and they are to be reported by the signalman for any excess of speed.

13. Should it happen (through any accident to the wires, instruments, or other apparatus) that only one needle will move, the signalman must give the signals Nos. 1, 2, 3, 4, 5, and 8 on that needle, and the signals No. 7 (Line blocked at my station), and No. 8 (Line clear at my station), by pointing the needle four times distinctly to those words on the instrument, and Signal No. 9 (Train waiting) by pointing the needle once to the left and once to the right, forming the letters D or M, and Signal No. 13 (Train not out, by moving the needle six times to the left. These signals must be repeated in the same manner by the signalman receiving them.

14. Any defect in the instrument, bell, or apparatus must immediately be reported to the clerk in charge, who will at once communicate with the Telegraph Inspector at King's Cross or Grantham, as the case may be, and telegraph Mr. Matthews, at Peterboro', to whom a letter containing particulars must be sent by first train.

15. No unauthorized person must be allowed to enter the Telegraph Office.

16. Any infringement of these rules will subject the offending party to instant dismissal.

Assistant Manager's Office,
King's Cross, 4th April, 1864.

WALTER LEITH,
Assistant Manager.

The ordinary rule, to be found in the regulations of most railway companies, which prescribes an interval of five minutes between following trains, does not appear to be in force on this portion of the Great Northern Railway, and hence there is nothing to prevent one train from following another (at all events where no tunnel intervenes) without any delay, but the driver of the following train must, in that case, according to the regulations, be cautioned by the signalman.

On the evening of the 30th ultimo, a Great Northern up coal train stopped at the Colney Hatch Station, $6\frac{1}{2}$ miles from King's Cross, at 7 h. 23 m. P.M. for the purpose of putting off a truck at that station, not for shunting the train, and the truck had been put off, and the train was in the act of starting again, when either a draw bar or the cotter of a draw bar of one of the waggons, broke, and it then became necessary to shunt that waggon into the siding lying east of the up line.

At 7 h. 27 m. the signalman at Colney Hatch received the telegraphic signal "Be ready," from Barnet, $2\frac{3}{4}$ miles from Colney Hatch, which meant that an up train was then approaching Barnet Station from the north, and this was almost immediately followed by the signal from Barnet "Train waiting;" and the Colney Hatch signalman states, that as the draw bar had then broken, he replied to these signals, "Train out" and "Line blocked," which meant that the coal train had reached Colney Hatch, and that the line at that station was then blocked.

Now, as I read the 11th rule of the "Instructions," the duty of the signalman at Barnet Station, on receiving those telegraphic signals, was to have kept his "danger" signal shown, and the approaching

"train having pulled up and passed within the distant signal, the station signal must immediately be placed at 'caution,' and the train allowed to proceed." He should also caution the driver by word of mouth that the "line is blocked at the next station."

I should now state that the up line at Colney Hatch is protected by a station and distant signal, the latter being about 670 yards north of the station, which distance is not sufficient and should be increased. The distant signal, when the weather is clear and the tunnel is free of steam or smoke, can, as the line is straight, be seen through that tunnel, which commences about 1,380 yards north of the distant signal. The line falls for many miles 1 in 200 from near Potters' Bar towards King's Cross.

As soon as the coal train reached Colney Hatch Station, the signalman placed the up station and up distant signals at danger, and they were not taken off before the collision actually took place, and there is no question whatever respecting these signals.

The signalman at Colney Hatch received the signal "Train in" from the signalman at Barnet, at 7 h. 28 m. P.M., and shortly afterwards he saw the Midland train, before it entered the tunnel, and judged that it was approaching very fast, and he thought the driver of the train would not be able to stop, and in consequence he called out to the driver of the coal train to get back into the siding as quick as possible, but the coal train engine was not quite clear of the up line when the coal waggons and break van, which had been left standing on the main line when the draw bar or cotter broke, were pushed forward by the Midland excursion train, which had come up, and run into the rear of the coal train and the coal waggons came in contact with the Great Northern engine of the coal train, thus causing a second collision.

The train which ran into the coal train was a Midland return excursion train, which left Derby for Kings Cross at 3 h. 15 m. P.M. It consisted of engine and tender, 19 carriages, and three break vans, with three guards; and the driver states that when he got in sight of the Barnet up distant signal it showed an "all right" light, while the station signal exhibited a caution signal, and his statement is fully confirmed by the fireman and second guard of the train; he saw the Barnet signalman outside his box, standing with three or four other men, and he states that the signalman did not speak to him, nor give him any signal of any kind. Neither the fireman nor any of the guards saw the Barnet signalman, and there is, moreover, a dispute as to the signal which was exhibited at the Barnet distant signal. The signalman maintains that it was at danger. The driver further states that when he had got a quarter or half a mile past Barnet Station he shut off the steam because he had been shown a green light at Barnet Station signal, and that he might be travelling from 45 to 50 miles an hour before he shut off the steam; that when he had passed the tunnel 200 or 300 yards, the Colney Hatch distant signal became visible at "danger," at which time he thinks he was travelling at from 30 to 35 miles an hour; he says he told the fireman to apply the break on the tender, and he blew the whistle for the signal to be taken off, and then blew it for the guards breaks, and as soon as he saw the tail lights on the break van at the end of the coal train, he reversed his engine, when he was 300 or 400 yards north of the distant signal.

The break van of the coal train, with 11 waggons in front of it, stood after the draw bar or cotter had broken 409 yards south of the distant signal, and the driver says he cannot make out how it was that he did not stop the train, but that there was a kind of mist like a cloud just above the metals, which would make them slippery, and he thinks he was running 10 miles an hour when he ran into the other train.

The fireman states that the driver reversed his engine 50 or 100 yards before reaching the distant signal, and the head guard did not hear the driver

whistle for the breaks until they had passed the distant signal. The second and under guards are not certain whether they had passed the distant signal when the whistle for the breaks was sounded. But all agree in saying that the speed began to slacken after they came out of the tunnel.

The true explanation why the driver could not stop is to be found in the fact that he probably under estimated the speed at which he was running down the incline of 1 in 200, and did not soon enough take steps to reduce that speed, but endeavoured instead to whistle off the danger signal, for which he was much to blame, and that he had a heavy train of 22 vehicles behind the engine with only three breaks. I think he also under estimated the speed at which he was running when the engine ran into the coal train. The head guard thinks it was from 12 to 15 miles an hour. The effect of the collision was to drive the body of the break van of the coal train on to the second coal waggon damaging the end of it, and the first coal waggon was broken to pieces, and one pair of wheels got under the tender, one pair under the engine, and two pairs under the smoke box of the engine. The buffer plank, buffers, and right hand feed pipe of the engine were broken, the foot plate bent up, and the life guards and draw bar of the tender were bent. The driver was thrown on his back on the coals in the tender, and the engine was thrown off the line.

The 11 coal waggons and break van were forced ahead some 220 yards until they came in contact with the engine of the coal train, and bent the side rods of the engine and tender and broke the steps, and four of the coal waggons were thrown off the line. The carriages of the excursion train were but little damaged.

The facts which were elicited when making this inquiry are not very reassuring as regards the precautions adopted by these two important railway companies, to ensure the public safe travelling on the Great Northern Railway, and these facts may be classed under two heads:—Firstly, as to the system of working the traffic on the Great Northern Railway, and secondly as to the means by which this system is carried out.

With regard to the system of working the traffic between London and Hitchin by means of the electric telegraph, it appears that according to the Instructions trains may follow each other without any interval of time or of space being preserved between them, but if the regulations are obeyed, the driver of a following train must be "cautioned by the signalman by word of mouth" that there is a "train ahead" or that "the line is blocked at the next station," and the engine driver is prohibited from travelling at a higher speed than 15 miles an hour after receiving a caution signal. It will have been seen in this instance that the Great Northern regulations were not obeyed by their own signalman at Barnet as to "keeping the danger signals shown," and as to the Midland driver being cautioned by "word of mouth;" but on the other hand, the signalman maintains that both signals were at danger until the train passed the distant signal, and that he could not caution a driver who passed by at the rate of 50 miles an hour. The station master and signalman at Barnet agree in stating that the driver was shown a caution signal by the signalman by means of a hand lamp, but the driver distinctly states that he received no signal from a hand lamp. If the present *practice* of working by telegraph is to be maintained, it will be desirable that the present instructions should be altogether revised, and explicit and intelligible ones issued in lieu of them, so that the *regulations* and the *practice* may agree. The safety of the public now entirely depends on the discretion of the engine drivers, and on their keeping their trains under control, and not travelling above 15 miles an hour when they have been shown a caution signal. I should, however, hope that the Great Northern Railway Company will modify their present system of working, and reintroduce the

thorough block system. The traffic between Barnet and Southgate at the time of this collision amounted to 78 up and 85 down trains, of which about one-half consisted of passenger trains, and there can be no question that on the falling inclines these trains are worked at high speed. I understand the block system was given up in 1860 owing to the fact of trains being continually delayed, and that was a necessary result of the telegraph stations being too far apart, a defect that is easily remedied.

As regards the means by which this system is carried out by the Midland Railway Company, it appears that the Great Northern Railway Company issue working time tables for every month, and transmit a number of the copies of these time tables to the superintendent of the Midland Railway for the use of the engine drivers, &c., and he sends some of them on to the Midland locomotive superintendent for distribution to the engine drivers.

These time tables contain on the last page a "Notice to guards and engine drivers" to the effect that between certain stations "drivers receiving a caution signal at a station semaphore are immediately to reduce their speed to not exceeding 15 miles an hour, and they are not again to increase that speed until they have received an all-right signal at another station semaphore.

"The caution signal will denote that a train is not far ahead, or that the line is obstructed at the next station."

Circulars to the same effect were also sent.

Now the driver of the Midland excursion train stated that he did not drive regularly to London and back, but for the last seven years he had been employed in occasionally taking up and bringing back excursion trains from London; that he had no copy of the Great Northern book of regulations, nor of their working time tables above referred to. He said that he had read a written order in the time office at Derby, dated 1862, and, as he read that order, he thought it said that as they went by a station they were to be cautioned if there was any obstruction between that station and the next station ahead; that he thought there was a regulation that the speed was not to exceed 15 or 25 miles an hour, he could not state which; that he was never allowed between Hitchin and London to pass a station without being actually stopped and told that there was some one shunting at the next station: that many times this year he had been actually stopped by the danger signals and told to go on with caution; and, he adds that he had been driving nine years and had never so much as broken a pair of buffers before.

I have no means of clearing up the discrepancy between the statements of the Barnet signalman and the driver and others with the Midland excursion train. As to the Barnet distant signal being at danger or not, the bulk of the testimony is against the signalman, and it is not very likely that a man who has never got into trouble should pass a distant signal at danger, the station signal being also at danger, at the rate of 50 miles an hour. It is, however, possible that he could see the station signal at "caution" before he reached the distant signal, and he says that he did do so, and that he would keep up his speed in consequence; and this undoubtedly points out an objectionable feature in the *practice* adopted on the Great Northern Railway. If a train is to be pulled up so that the driver may be cautioned by "word of mouth," the danger signals should be shown against the train until the driver has pulled up, and not taken off as soon as the train comes in sight, nor even as soon as it has passed the distant signal.

I consider that more blame attaches to the Midland authorities as regards this collision than to any other parties, and as it is not the only case of the kind that has come to my notice, it is necessary to advert to it. Drivers that are sent on foreign lines should in all cases be furnished with the regulations that should govern their mode of driving on these lines; and if the locomotive superintendent is too much occupied

with other duties to attend to this very essential duty, it should be transferred to the officer responsible for conducting the traffic.

Again, there were only three breaks attached to this train, which was made up at one station, which travelled to the north and returned without having been taken apart. Now if this train had been fitted

up with continuous breaks, I feel confident, that notwithstanding the mismanagement to which I have directed attention, there would have been no collision.

I have, &c.

W. YOLLAND,
Colouel.

*The Secretary of the
Railway Department,
Board of Trade.*

GREAT SOUTHERN AND WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 5th January 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Southern and Western Railway Company, the enclosed copy of the report made by Capt. Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred on the 4th September last, to Humphrey Leary, a porter, whilst shunting cattle trucks at the Charleville station of the Great Southern and Western Railway.

My Lords direct me to express their hope that the Directors will see fit to adopt the method proposed by Capt. Rich for shunting cattle trucks at the Charleville station.

I am, &c.

*The Secretary of the
Great Southern and Western
(of Ireland)
Railway Company, Dublin.*

*Board of Trade
(Railway Department),
Whitehall, 5th January 1866.*

SIR,

WITH reference to my letter to you of the 25th September last, on the subject of the accident which occurred to Humphrey Leary, a porter, whilst shunting cattle trucks on the 4th of that month, at the Charleville station of the Great Southern and Western Railway, I am directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the information of the Lord Lieutenant of Ireland, the enclosed copy of the report made by Capt. Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected therewith, together with a copy of a letter which their Lordships have caused to be addressed to the railway company with respect to the accident in question.

I am, &c.

*Sir Thomas Larcom, K.C.B.,
Secretary to the
Lord Lieutenant, Dublin.*

*Board of Trade
(Railway Department),
Whitehall, 28th December 1865.*

SIR,

IN compliance with your minute of the 25th September, 1865, directing me (the first time that railway business took me to Ireland), to inquire into an accident which was brought to the notice of the Board of Trade by the Lord Lieutenant of Ireland, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances, connected with the said accident, which occurred on the 4th September 1865 at Charleville station on the Great Southern and Western Railway when one of the porters of the Railway Company received such injuries, that he died five days afterwards.

A train, consisting of an engine and tender, 17 waggons (the greater portion of which were filled with cattle), and two guards' vans, left Limerick for Cork at 5.45 p.m. It reached Charleville (near which station the Limerick and Cork Direct Railway forms a junction with the Great Southern and Western Railway) about 8 p.m. The Limerick and Cork Direct Railway is worked by the Great Southern and Western Railway Company.

Charleville station and goods sidings are on an incline of 1 in 227; as it is a junction station, some shunting had to be done on the evening in question.

The two guards of the goods train and the foreman of porters were engaged with Humphrey Leary in doing this shunting. Leary was the shunter, whose duty it was to unhook and hook up the waggons that had to be shunted.

Fourteen or fifteen cattle waggons were attached to the engine and tender during the whole of the shunting. This can hardly benefit the cattle, and certainly renders the operation of shunting more dangerous to the shunter, particularly on an incline like that at Charleville, as the extension and drawing in of the couplings, of so many waggons, makes it more difficult for the driver and shunter to calculate their distance.

This mode of shunting is practised by the Great Southern and Western Railway Company in order to keep their trucks better sorted and ready to be dropped in their respective places, on the arrival of the train at Cork; but I think, that when the wear and tear of the waggons, &c., is considered, as well as the danger to the men employed, that the company would find it advantageous, to arrange the Charleville station, so that the cattle trucks, &c., might be placed in a siding, while the shunting is done by the engine.

On the evening of the 4th Sept. Humphrey Leary had made several shunts. In obedience to a signal given by him with his hand lamp to the driver, the engine and tender, with the cattle trucks, were moved back for the fourth time, for the purpose of loosening the couplings, and enabling Leary, to unhook some waggons he wished to shunt. Three or four minutes after the engine was put back, one of the guards, who was at the points adjacent, heard Leary call out, "Oh my leg." Both guards ran up to him, and found him lying outside the rails, near the slope of the bank, with his right leg and arm smashed, from having been run over by part of the train.

As Leary had not unhooked the trucks, I am of opinion that the driver must have pushed back quicker than he expected, and that he must have been run over in attempting to get in between the waggons, to unhook them.

Whether he was hurt in attempting to get in or out, is uncertain. Although the man was perfectly sensible after the accident, I could obtain no evidence of his having given any account of how the accident happened.

As it occurred on Monday, and he did not die till the Saturday following, this appeared rather extraordinary. The driver, William Brown, gave his evidence in a most unsatisfactory manner, and I found it almost impossible to obtain from him a distinct account of the various shunts, &c., that he had made, after his arrival at Charleville, on the evening of the accident.

Humphrey Leary was an experienced hand, and had been two years at Charleville station. The driver has also been some time in the company's service, and bears a good character.

I think it but fair to the latter to add, that it is a well-known fact, that many of the porters, who are in the constant habit of shunting trains, become very careless of the danger which always attends it, to a greater or lesser extent.

I have, &c.,

*The Secretary,
Board of Trade
(Railway Department),
Whitehall.*

F. H. RICH,
Capt. R.E.

GREAT WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 29th July 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Western Railway Company, the enclosed copy of the report made by Col. Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred on the 28th ultimo to a ballast train at the Bruton station of the Wilts, Somerset, and Weymouth branch of the Great Western Railway.

My Lords trust that the directors will give their careful consideration to the recommendations contained in Colonel Yolland's report.

*The Secretary of the
Great Western
Railway Company.*

I am, &c.,
W. D. FANE.

*Board of Trade
(Railway Department),
Whitehall, 22d July 1865.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 11th instant, the result of my inquiry into the circumstances which attended the fatal accident that occurred on the 28th ultimo to a ballast train at the Bruton station of the Wilts, Somerset, and Weymouth branch of the Great Western Railway, when the engine driver, Alfred White, and fireman, Radford Bartlett, of the train were killed, the head guard was seriously injured, and another servant of the Company, a fitter, was slightly injured.

This part of the Wilts, Somerset, and Weymouth branch is worked as a single line, although Bruton station is provided with up and down platforms, and is occasionally used as a passing place for up and down trains, although not intended to be so used when the line was first opened.

The down platform is situated alongside of a siding which is entered from the single line by a pair of facing points placed a short distance to the north of the station platforms, and trains which have entered this siding can only get back again on to the main line by being shunted back over the same points through which they had entered the siding, or by running ahead some 160 yards along the siding, and then being shunted back by another pair of points, south of the station platforms, which also present facing points to a down train.

There is also another siding lying west of the single line, passing through the goods shed, and terminating about 190 yards to the south of the facing points, on the single line opposite to the up platform, by which this siding is entered. The end of this siding is close against the turnpike road leading from Bruton to Wincanton, which crosses under the railway, the road being somewhere about 25 feet below the level of the railway. Wooden buffers supported by props were placed at the south end of this siding, and a quantity of stone was also placed behind the buffers so as to increase the amount of resistance, in the event of waggons or trucks being shunted too violently against them.

Thus there are three facing points against a down train, but no facing points against an up train. The down platform is but seldom used.

On the evening of the 28th ultimo, the 4 h. 50 m. P.M. down train from London, due at Bruton station at 8 h. 42 m. P.M., reached that place at 8 h. 44 m. A carriage truck was taken off the train at Bruton station, and when the train had left, the policeman on

duty, James Andrews, proceeded to put it into the siding lying west of the single line. He unlocked the padlock, opened the facing points opposite to the up platform, and, assisted by the goods porter, put the truck out of the way, against the south end of the up platform. At that time there was a loaded flour truck standing under the goods shed, and three empty timber trucks at the south end of this siding, close against the buffers.

The policeman Andrews, who was then in sole charge of the station, according to his own statement, then went down to the gate, at the entrance of the yard and locked it, thence he returned to the office and telegraphed "line clear" to Witham Friary station, $5\frac{1}{2}$ miles north of Bruton, for a ballast train to proceed, and then he received a telegraphic message from Castle Cary station, three miles south of Bruton, that the line was clear for the ballast train as far as that station. He then went and lit the down signal lamps and turned them to "all right" for the ballast train coming from the north to pass, thence he went and examined the facing points north of the platforms, next he got the lamps for the up signals out of the lamp house, and examined the southmost pair of facing points, and then returned to the station building.

At 9 h. 55 m. P.M., he received a telegraphic signal from Witham Friary station that the ballast train had left for Bruton, and then he lit his hand lamp and stood on the up platform till the ballast train came in sight, and showed a "white light" or "all right" signal towards it. The ballast train came up at the rate of 35 miles an hour, according to the policeman, or at 15 or 16 according to the under guard who was in a van at the tail of the train, and when it came to the middle facing points opposite to the up platform it took the same course as the carriage truck had been pushed along, and passed into the siding lying west of the single line, first struck the truck loaded with flour standing under the goods shed with a crash, some one on the engine having sounded the break whistle just before doing so, thence the ballast train pushed the flour truck and the empty timber trucks against the buffers, sweeping everything before it, and fell crashing down into the turnpike road below. The flour truck landed beyond the opposite wing wall of the under bridge, the engine falling against that wing wall and breaking it down, and then rolling over on to its right side, the tender being doubled up against the engine, nine of the loaded ballast waggons getting off the rails and falling over the engine, tender, and timber trucks, filling up the space with a heap of ruins; four trucks and a van remained above; the sunken road, as described by one of the witnesses, being full. The engine driver and fireman were, it is supposed, killed on the spot, but strange to say the head guard and the fitter, a one-legged man, who were riding in the ballast truck next to the tender, lying down in the truck, escaped with their lives, while the under guard and seven of the ballast men who were in the van at the tail of the train escaped unhurt, and some of the ballast men who were inside the van were awakened from sleep some time after the accident had occurred.

The engine was greatly damaged and the tender almost destroyed, and the same may be said of the trucks which were precipitated into the road below the line.

There does not appear to be any blame attaching to any other servant of the Company except the policeman Andrews, who forgot to close and lock the switches after he opened them to admit the carriage truck into the siding. He is to be tried for manslaughter at the next Salisbury assizes. He is

said to be a steady man and attentive to his duty, at which he has been employed between 15 and 16 months.

In addition to the loss of life occasioned by this accident there will be considerable loss from the damage done to the rolling stock. It points out as clearly as possible the absolute necessity of not depending solely on the recollection of a single man, and the expediency of contriving by mechanical means that in all cases no accident of this kind shall be possible without giving the drivers and firemen on engines a chance of providing for their own safety.

Facing points on single lines cannot be avoided. On narrow-gauge lines they are usually self-acting, and weighted so as to close of themselves when the lever handle is let go, and then stand right for the main line. On the broad-gauge system of railways self-acting points have been always objected to. I have always considered that this was a mistake; but recent improvements have enabled facing points to be made comparatively safe, by working them in connection with the station signals without actually connecting them together.

I am glad to learn that the directors of the Great Western Railway Company have already determined that the signals at this station shall be so fitted that when they are turned to "all right" the facing points must previously have been set right for the main line on which the train is to travel.

It will, however, be necessary, in order to avoid the unnecessary pair of facing points that led to this accident, that the siding alongside of the down platform should be converted into the down line at this

station, by connecting it directly with the other line at the south end of the station, or by continuing it as the second line on to Castle Cary station, a distance of about three miles. Of course, the addition of another line to Castle Cary would be more expensive, but it would enable many delays to trains to be avoided which otherwise will occur on a long length of single line.

The remarks which I have made respecting Bruton station apply with equal force to many stations on the Great Western lines, and the alterations, which I understand have been determined upon as regards Bruton might very judiciously be extended to all, though the process must necessarily be a gradual one.

It would also be desirable to add distant signals at Bruton and all other stations at present not furnished with them. I believe the advantage of having them is fully recognized by the officers of the Great Western Railway Company.

I should also add that the system under which the telegraphing of trains is carried on is not so good or so safe as that now generally employed. A single needle instrument is made use of, and many stations are on the same circuit of wire: this introduces confusion and leads to delay. Where traffic is worked with the assistance of the telegraph it is desirable that the instruments employed should have separate wires not extending beyond the adjacent stations, and also that they should be distinct from those used in sending messages.

I have, &c.

*The Secretary of the
Railway Department,
Board of Trade.*

W. YOLLAND,
Colonel.

GREAT WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 8th August 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of the Directors of the Great Western Railway Company, the enclosed copy of Colonel Yolland's report on the circumstances connected with the accident that occurred on the 21st July last, near Twyford.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Western Railway
Company.*

SIR,

Whitehall, 5th August 1865.

I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your instructions of the 24th ultimo, the result of my inquiry into the circumstances which attended an accident to a down passenger train, that occurred near Twyford station on the Great Western Railway on the 21st ultimo. It is stated that no person was hurt.

The inspector of permanent way, when walking along the line a short distance to the east of Twyford Station on the previous day, noticed that the longitudinal timber carrying the left rail of the down line was canted over too much, and on trying the gauge he found that the line was tight to gauge, he says $\frac{1}{8}$ th of an inch, and the ganger, who was with him at the time, names $\frac{1}{4}$ of an inch, and he instructed the ganger to alter the cant on the following day. At this part the line is perfectly straight for a considerable distance.

On the following morning between 10 and 11 o'clock, after the 9.15 a.m. down express train had passed, the ganger and four men proceeded to remove the ballast both outside and inside the left longitudinal timber of

the down line for a length of about 120 feet, and also to pick out the ballast from under the outer side of the longitudinal timbers, for a breadth of 4 or 5 inches, and to a depth of $1\frac{1}{2}$ or 2 inches, replacing the hard ballast with loose ballast thrown in with a shovel; they also slackened off the nuts at the ends of the strap bolts to the extent, they say, of about $\frac{3}{4}$ inch, and five of the strap bolts were broken in doing this. Of these five, four had been replaced by new strap bolts before the accident occurred, and one of the men had gone for another strap bolt to replace the fifth when the accident took place.

I should explain that these strap bolts pass through the longitudinal timbers and are fastened to the wooden transoms by bolts, and they have threads on the outer ends on which nuts are screwed, by which means the longitudinal timbers are kept at the proper distance apart, the transoms preventing their approximating too closely together, while the strap bolts on the other hand, one through each longitudinal, fastened to the transoms, when the nuts are screwed up tight against the sides of the longitudinals prevent their being too far apart. The transoms and strap bolts occur at about every 11 feet along the line.

Two of the men were employed in packing beneath the longitudinal timbers with shovels, when the 2.0 p.m. down train from Paddington to Reading, which does not stop at any intermediate station, approached the place where they were at work, at a speed which the driver of the train thinks could not be less than 40 miles an hour, and which was probably in excess of that rate.

No caution of any kind was given to the driver to go steadily; none was considered to be necessary; and the driver informed me that when the engine reached the spot where these men were at work, it rolled and tumbled about a good deal, and he jumped to the alarm whistle and sounded it for the guard's break, and shut off the steam, while the fireman took one or two turns of the handle of the break on the tender,

which then overpowered and disabled him for a moment. The driver says the right wheels of the tender got off the rails when it reached the spot where the men were at work, and that he saw every one of the other vehicles drop off the rails in succession as they came to the same spot. The engine was stopped just close to Twyford Station, on the eastern side of it, and after the train had run nearly 400 yards from the place where the first wheel got off the rails; the whole train remained coupled together throughout, and the driver appears to have acted very judiciously in pulling up, by keeping the carriages stretched out.

About 300 yards of the line was more or less damaged. The engine did not get off the rails at all, and the tender got on the rails again before the train stopped, and it was then found that a luggage van next to the tender had a pair of wheels, and one carriage was entirely off the rails; the next two carriages were on the rails, then six carriages were off, then two carriages were on, and lastly a horse-box at the tail of the train was off the rails.

When the line was examined after the accident, the first marks that could be traced of any wheels being off the rails were found at about 30 feet from the spot where the platelayers had commenced work and cleared out the ballast at both sides, and picked the hard ballast from under the outside of the left longitudinal timber of the down road, on the flange inside the right rail, apparently made by the outside edge of the right wheel when it dropped off inside the right rail, close alongside of a transom where the fifth strap bolt that had been broken was still wanting; and the driver says that when he went back to see what was the matter, after the train had stopped, he could see a space between the end of the transom and the side of the longitudinal timber sufficient for the wheel to drop in. One of the platelayers who was at work at the spot at the time the train came up, shovel packing on the outside of the longitudinal, admits that there was a space of an inch between the end of the transom and the longitudinal; and as the cant of the longitudinal had also been removed, I

have no doubt the gauge was so wide as to admit of a wheel dropping inside the right rail.

From this point forward it was evident that many wheels had been off the rails, which in some places were bent, as the flanges of both rails were broken in many places, and the heads of the flange bolts marked, and in some instances crushed into the rail. Some of the marks were outside both rails, and some inside both rails. The top plate of the trailing spring of the guard's van on the off side was broken in two places, but the fracture was a recent one, and was evidently the result of the accident. Nothing was wrong with the engine.

There is no doubt that this accident was occasioned by the gross carelessness of the platelayers in slackening off the nuts on the strap bolts for a length of 120 feet, to the extent, as they admit, of $\frac{3}{4}$ of an inch, at the time when they had one strap bolt out altogether, and had picked out the hard ballast from under the outside of the left longitudinal timber of the down road to the depth of $1\frac{1}{2}$ or 2 inches, in order to alter the cant of that timber, without having previously sent back a man with a signal to warn the drivers of trains to proceed cautiously.

It was entirely unnecessary to slacken the nut on the strap bolts beyond the $\frac{1}{8}$ th of an inch, but the ganger states that he was only doing what had frequently been done before on the line, without any similar accident having ever occurred.

I understand that instructions have already been given, that whenever it is necessary to alter the cant of the longitudinal timbers so as to give greater width of gauge, it is in future to be done by raising and packing ballast under the inside instead of picking it out from under the outside of the longitudinal timbers.

I think it would also be desirable to direct the platelayers not to take out a strap bolt unless they have a new one at hand ready to be put in, in the event of its breaking in the act of taking out.

I have, &c.

GREAT WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 7th October 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade, to transmit to you to be laid before the Directors of the

Great Western Railway Company,
Midland Railway Company,

the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 4th ultimo between a Midland passenger train and a Great Western goods train on the West Midland section of the Great Western Railway near Droitwich.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Western
Railway Company.
The Secretary of the
Midland Railway
Company.*

*Sandown, Isle of Wight,
3rd October 1865.*

SIR,

I HAVE the honor to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 6th ulto., the result of my inquiry into the circumstances which attended a collision that occurred on the 4th ulto.

between a Midland passenger train and a Great Western goods train on the West Midland section of the Great Western Railway near Droitwich. Five passengers are stated to have been injured, but none of them were seriously hurt.

It appears that as No. 28 up goods train from Wolverhampton to Newport was travelling between Droitwich and Fearnall Heath, the after pair of wheels of one of the waggons got off the rails, and after running about half a mile, damaging a large proportion of the transoms of the longitudinal sleeper road, they were broken off from under the waggon, and the train separated into two parts, and some of the waggons were thrown off the line. The guard of the train, who was riding in a van at the tail of the train, states that he was first made aware that something was wrong by feeling a sudden jerk, and on putting his head out of the van to endeavour to ascertain what was amiss, he found that he could not see on account of the dust, and he then knew that something must be wrong with his train. He then applied his break, and when the speed had been reduced from about 15 to 3 miles an hour he got out of his break van, and immediately saw that one of the waggons, had got off the rails, and was foul of the down line, and that a down goods train was approaching. The guard further states that he took his red flag out of the van, and ran ahead as he saw the down train approaching towards the spot where the down line had been blocked by the waggon, and from knowing that

according to the working time tables there was no other up train then due to follow his own train. He says the engine was about 250 yards from him when he got out of his van, and was still going ahead, as the driver did not apparently know that his train had broken asunder, and he ran 100 yards beyond the waggon that had fouled the down road before he made the fireman aware that it was blocked, and then he made the best of his way back towards the rear of his train, but did not reach it before the Midland passenger train had arrived, and had struck the van.

The statements of the driver and fireman of the up goods train correspond, but differ from that of the guard.

The driver says that while travelling at from 12 to 14 miles an hour he happened to look back, and saw that he had lost part of his train, and he gradually pulled up, and when he had stopped, but not before, he saw the guard of the train standing in the down road with a red flag in his hand, just where the waggon was foul of the down line; that the fireman got off the engine and went back, perhaps 15 or 20 yards, and then returned, and the driver then told him to uncouple the engine from the three waggons which still remained connected to it, as he saw the steam of a down train approaching. He then ran ahead 150 yards or more to meet the approaching down train, and succeeded in stopping it about a quarter of a mile from the obstruction in the down road.

The Midland train, which had come up and ran into the guard's van of the up goods train, which, in consequence of the separation of the train into two parts had been brought to a stand still on the up line, was the second part of the 1 h. 55 m. P.M. passenger train from Birmingham to Gloucester, and which consisted of three carriages, two horse boxes, and one guard's break van—a special train, not named in the Company's working time tables. It left Birmingham at 2 h. 48 m., or 38 minutes after the regularly appointed train, and when it reached Droitwich, the signals were against it, and it was almost brought to a stand still, until the 10 minutes had elapsed, which are prescribed in the Great Western sheet of Regulations herewith enclosed, as necessary to be preserved (in working the traffic on this portion of their West Midland branch) between a preceding coal train and a following passenger train when the "line clear" has not been received by telegraph from the station in advance, in this instance from Fearnall Heath, three miles distant from Droitwich. In accordance with these regulations, the driver of the Midland passenger train had a "caution ticket" given to him by the signalman at Droitwich, on which was printed—

"Great Western Railway.

"*Proceed*

"*Cautiously.*

"Train, on line between Droitwich and Fearnall
"Heath."

The guard of this train states that they left Droitwich at 3 h. 36½ m., and that he looked at his watch when he got out of his van after the collision had taken place, and it was 3 h. 40 m. The distance is 1 mile 51½ chains from Droitwich to the spot at which the guard's van was run into, mostly on a rising gradient of 1 in 387, and the time occupied in running it was 3½ minutes.

The guard's van could be seen, if a sharp look-out had been kept, at a somewhat greater distance than 400 yards. Taking this fact into consideration, and making allowance for the time occupied in getting up and reducing the speed, I can only arrive at the conclusion that the driver was not proceeding

cautiously, as directed by the caution ticket. He estimates that he was travelling at 20 miles an hour when he came in sight of the other train and at five or six miles an hour when the collision took place. I think his estimate was much under the mark in both instances, as the effect of the collision was to knock the van and three waggons off the line and cause the van to mount on one of the waggons and to be much damaged and the buffers of the engine were broken. The Midland driver was decidedly to blame for not paying attention to the "caution ticket." Had he proceeded "cautiously" the collision could not have taken place, notwithstanding the fact that the guard of the goods train did not obey the Company's regulations in going back immediately his train stopped, in order to protect it from a following train. I think this guard was also to blame.

But the collision would not have occurred at all except for the accident which had previously taken place to the up goods train. I have already stated that this train ran with a pair of wheels off the rails for about half a mile and the first marks which could be traced of a wheel being off the rails were found on two bolt heads inside the right rail, immediately followed by a mark on the next forward transom close to the right longitudinal. It is stated that the line at this part was in good gauge and had an amount of cant sufficient for the easy curve of the line at this part (136 chains radius), but on examination and on inquiry I ascertained that two damaged rails had been taken out of the line, one from the left rail immediately preceding the marks on the bolt heads, and another a few rails' length further back from the right rail, and on fitting these rails into their places, it appeared that the one out of the left line of rails and nearest to the marks on the bolt heads was a good deal damaged in the centre, a piece of the top table, two feet in length, having been broken off the rail. The laminated piece was still attached to the rail on the day of the accident, but was broken off by the platelayers to enable them to take out the fang bolts prior to the rail being taken out and replaced. I did not see the piece that was broken off.

The inspector of permanent way and the platelayers tried to make it appear that the accident was occasioned by the axle boxes and springs of the waggon having broken before any wheel was off the line. There is little doubt that it was the after pair of wheels of the third waggon from the engine which first got off the line—an iron waggon—which it remained attached to the second waggon until the front part of the train had been stopped, having travelled for a considerable distance, near 600 yards, with only a pair of wheels, and it had lost the axle boxes and springs. Some of the platelayers asserted that one of these axle boxes and springs was 40 or 50 yards nearer to Droitwich than the marks on the bolt heads, but from other evidence that was brought forward, I do not think any credit could be given to the statement.

I attribute the accident to the bad condition of the permanent way, and think the left wheel probably mounted the left rail where the rail was laminated. The Great Western Railway Company are engaged in relaying this portion of their line, and there can be no doubt that it has been allowed to get into very bad condition, so that the sooner the relaying is completed the better. It is not at the present time in a fit state to run over at high speed.

The Secretary
Board of Trade,
Whitehall.

W. YOLLAND,
Colonel.

GREAT WESTERN RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 10th October 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade, to transmit to you, to be laid before the Directors of the Great Western Railway Company, the enclosed copy of the Report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred to a passenger train near the Banbury Station on the 9th ultimo.

I am, &c.

W. D. FANE.

The Secretary of the
Great Western Railway
Company.

Hampton Court,
5th October, 1865.

SIR,

IN compliance with the instructions contained in your minute of the 18th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 9th ultimo, near the Banbury Station of the Great Western Railway.

The 3.40 p.m. fast train from Paddington to Birmingham and Chester left Oxford at 5.22, seven minutes late, on the afternoon in question, consisting of an engine and tender, a van, and five passenger carriages. A carriage was *slipped*, as is usual with that train, at Banbury, and the train proceeded towards Birmingham at a speed of about 50 miles an hour. It had not gone more than $2\frac{1}{2}$ miles beyond Banbury when the engine-driver felt a sudden shock, and the leading end of the engine dropped. He had just time to shut off his steam before the engine turned to the left and fell on its right side in a field on the west of the line.

The line was straight, and fortunately on an embankment only two or three feet high. The engine does not appear to have travelled more than 60 yards after the first shock until it came to a stand. As it fell on its side, the tender swung past it, and it was found at right angles to the line, wheels uppermost. The carriage, a first-class, which had been next behind the van, lay in front of it on its side. The next, a second-class carriage, was still further to the front, but on its wheels; and the other two carriages remained on the rails. The engine-driver and fireman, who had no time to jump from the engine before it fell on its side, were surprisingly little injured, considering the suddenness with which it was brought to a stand, and were only off work, the one for a fortnight, the other for a week after the accident. The guard, who was writing in his van, heard the gravel flying, and on looking forward was at once thrown down and partially stunned. When he got up again he saw the engine in the field, and found his van hindmost in front of it. Out of 30 or 40 passengers, who must all have been more or less shaken, five or six have complained of injury.

The cause of this accident was evidently the fracture of the leading axle of the engine, which gave way on the left side, on the line marked A B in diagram No. 1. That diagram represents the original axles constructed for the engines of the *Queen* class, on the Great Western Railway; and it appears that there were 12 axles of the same description used as leading and trailing axles for five engines. Those engines have run since they started up to the 9th September last,

The Sylph	-	-	-	506,735	miles
" Prince	-	-	-	495,042	"
" Peri	-	-	-	510,687	"
" Elk	-	-	-	471,084	"
" Queen	-	-	-	494,427	"

and it may be assumed, therefore, that these axles have done an average duty of 413,000 miles each. There is, however, no record which will show the exact mileage of this particular axle, No. 1,154. The number refers to a record which was formerly kept, but which has unwisely been discontinued for several years.

The engine in question, the *Sylph*, was a six-wheeled engine, with cylinders measuring 16 inches in diameter and a stroke of 24 inches. The leading and driving wheels were eight feet, and the driving and trailing wheels seven feet apart, from centre to centre. The driving wheels, seven feet in diameter, carried 11 tons 10 cwt.; and the leading and trailing wheels, four feet in diameter, 8 tons 6 cwt., and 6 tons 6 cwt., respectively. The *Sylph* was taken into the shops at Birmingham for repairs in March 1865, and was sent to work again on the 30th April. During that time No. 1,154 axle was placed under its leading end, and it has since run 15,931 miles. The axle and wheels had previously been sent to Swindon, in order that the wheels might be retired, and they had been lying in the Birmingham yard after being returned ready for use from Swindon, for some period which I was unable precisely to ascertain. The axle was examined by the locomotive foreman at Birmingham, and by the leading fitter, before it was put under the *Sylph* in April 1865, and they did not see any defect in it. But the accompanying section (Drawing 3) shows how little of it, as shaded, was holding when it finally failed.

No. 3.

Section of axle which failed under the "*Sylph*" engine, on the Great Western Railway, 9th September 1865.

The portion not shaded in the diagram had failed by degrees during the running of the engines under which it was employed, and the flaw must have commenced from the exterior, and worked gradually inwards. I cannot for a moment believe that the axle remained perfectly sound while doing a duty of—say 400,000 miles, and that it then suddenly failed to the extent of from one half to two thirds of its section, while running 16,000 miles; and I am, therefore, unable to resist the conviction that indications of the flaw might have been plainly seen when the axle was placed under the *Sylph* if it had been examined at that time with sufficient care.

There were external marks of a similar flaw at the other end of the opposite journal, which proved, however, when the axle was broken at my request, to be very much smaller. The iron was of good quality.

It will be observed from Diagram No. 1, that the circular line A B round the journal of this axle formed an abrupt termination, near the points of greatest strain, to the slope from the portion of greater diameter, to which the wheel was affixed; and that this line was a natural starting line, technically called a *shoulder*, for flaws of this description. The construction of the axle was so far defective; and I enclose a diagram, marked No. 2, of an improved form which has been adopted since May 1865, with the view of avoiding this defect, and, it is hoped, of preventing such accidents for the future.

N^o 1.

ORIGINAL

LEADING AND TRAILING AXLE FOR PASSENGER ENGINES QUEEN CLASS.

G. W. R. Swindon.

Nº 2.

G.W.R. SWINDON.

LEADING AND TRAILING AXLE FOR PASSENGER ENGINES, QUEEN CLASS.

Alteration, May 4th 1865.

I enclose further a copy of the instructions which have been issued by Mr. Armstrong, the Locomotive Superintendent of the Great Western Railway, since the above accident, for ensuring more careful examinations of and better records in regard to the locomotive axles used on that line. It is essential that the utmost care should be taken in these respects, inasmuch as the failure of the leading axle of

an engine travelling at high speed is perhaps the most dangerous accident that can happen to a passenger train.

*The Secretary
(Railway Department)
Board of Trade,
Whitehall.*

I have, &c.
H. W. TYLER,
Capt. R.E.

GREAT WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 11th January, 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, to be laid before the Directors of the Great Western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred at the Gloucester station of the Great Western Railway on the 26th ultimo.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Western
Railway Company,
Paddington.*

Whitehall, 9th January, 1866.

SIR,

I HAVE the honour to report for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your Minute of the 1st instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 26th ult., at the Gloucester station of the Great Western Railway, on which occasion nine passengers were slightly injured.

Gloucester Great Western station is only provided with one platform placed alongside of the down line, and all passenger trains both up and down are brought to this platform. On the evening of the 26th ult., the ordinary train from Cheltenham, due at Gloucester at 7h. 15m. p.m., did not arrive till 7h. 25m., at which time the train from Milford, due at the same hour, had not arrived.

The Company's mode of working their passenger traffic provides, that in the event of its not being practicable to unite these two trains into one and to despatch them to Swindon within about 20 minutes of the appointed time, the first is to be sent forward as a special train. Accordingly, the ordinary train from Cheltenham, which consisted of five vehicles, was about to be despatched as a special train, and would already have started at 7h. 31m. p.m. had not the engine left to take water, and it was standing alongside of the station platform when the 11h. 20m. a.m. up passenger train from Milford arrived and ran into the last vehicle at a speed which was estimated to be about 10 miles an hour. No damage was done to the engine or carriages of the Milford train, and the only damage done to the carriages of the special train was

the bending of the buffers on the last carriage; no vehicle was thrown off the rails.

Gloucester station is protected on the west towards Wales, by an up station signal, placed about 160 yards to the west of the spot where the collision took place, and by a distant signal 250 yards west of the up station signal, but it is more effectually protected by the fact that at about three quarters of a mile from the station an up train has to ascend inclines of 1 in 120, and 1 in 95 for five eighths of a mile to the summit, and then there is a descent of 1 in 99 towards the station for a short distance.

On this occasion it is admitted that both the station and distant signals were on at danger against the up Milford train, and the distant signal can be seen a long distance except when there is a fog. The driver admits that he saw it a long distance before he came to it, and the simple explanation of the cause of the collision is that he neglected to shut off his steam soon enough, and failed to take the necessary measures for reducing his speed sufficiently early, to prevent him from running past the danger signals and into the special train. He urges in extenuation, that he had been mostly employed in driving heavy goods trains, when it is necessary to keep on the steam till much nearer the station, in order to get over the rising inclines to which I have alluded.

It was stated that some of the doors of the carriages of the special train that was standing alongside of the platform had both doors locked, and the passengers were thus prevented from getting out, when the Milford train was seen to be approaching at too great speed; but the station-master informed me that he did not think that there was more than one or two doors locked on the platform side. This is one of the many disadvantages that attend stations which have a platform only at one side. It would have been quite right that the doors of the carriages next to the platform on the off side should have been locked as soon as the train was ready to leave the Gloucester station platform, while those on the near side should have been unlocked, but in the hurry of dispatching trains these matters are frequently not done.

I should add that the up distant signal is not placed at a sufficient distance from the up station signal to be of much utility in foggy weather, and for that reason it would be desirable to remove it to a greater distance.

*The Secretary of the
Board of Trade,
Whitehall.*

I have, &c.
W. YOLLAND,
Colonel.

HIGHLAND RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 11th November 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Highland Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 21st ultimo, between two passenger trains, at the Pitlochry station of the Highland Railway.

I am, &c.,
W. D. FANE.

*The Secretary
of the Highland
Railway Company.*

*Dunkeld,
6th November 1865.*

SIR, IN compliance with the instructions contained in your minute of 31st ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 21st ultimo at the Pitlochry station of the Highland Railway.

There is a double line at this station, 400 yards long; but the line is single on either side of it. It is situated on a gradient falling southward of 1 in 300, 275 yards long; it is approached from the north on a falling gradient of 1 in 85 nearly a mile long; and on the south the same gradient of 1 in 85 continues to fall towards Perth.

On the evening in question the 12.40 p.m. passenger train from Inverness left Killiecrankie at 5.38, seven minutes late, consisting of an engine and tender, a horse-box, a break-van, two composite, three third, and three first-class carriages, and a second break-van. The engine-driver shut his steam off at the "head of the bank," as usual, and found the Pitlochry distant-signal turned off, when he came in sight of it, in answer to his whistle. The station signal was at danger, and he whistled for the guard's breaks in passing under a bridge over the line, some 300 yards north of the station, from which it is visible. He whistled for them again after passing the upper points, 181 yards north of the station platform, and then, finding according to his own statement and that of his fireman, that the train was "pushing" upon him, and that he was unable to pull up at the platform, he reversed his engine and put on steam against it, while the fireman applied sand to the rails. But the train ran forward beyond the up platform, and came into collision with a down train which happened at the same moment to be passing through the lower points, 139 yards south of the station, towards the down platform.

This train left Perth at 4.24, nine minutes late, and consisted, in approaching Pitlochry, of an engine and tender, two cattle-trucks, a horse-box, a third-class, a composite, a third-class, and two first-class carriages, with a guard's van. The engine-driver found the distant signal at danger, and shut off his steam, but as it was lowered in answer to his whistle he turned on his steam again to draw up to the station. When he was about 25 yards from the points he saw the up train "coming round the end of the goods shed" and approaching the station in the opposite direction. He noticed that there was fire flashing from the wheels of that train, and feared that it might not be able to pull up, and he shut off his steam and reversed his engine in the hope that the engine of the other train might strike the cattle trucks of his own train rather than the carriages which were behind them.

The engine of the up train grazed the first cattle-truck of the down train, did more damage to the

second cattle-truck, broke in one side of the horse-box, struck the end of the first third-class carriage and threw it off the line, and smashed the composite carriage to pieces. The other third-class carriage, though it was not struck, was also thrown off the line, but the rest of the vehicles remained on the rails, and none of the couplings gave way.

Nine of the passengers appear to have suffered from the effects of the collision, including one who had his collar-bone broken.

The speed of the up train is variously given by the different witnesses. The engine-driver of that train states that he was going 6 or 8 miles an hour when he passed the north points, and that he had "almost come to a dead stand" when the collision occurred. The fireman corroborates the latter statement, and estimates the speed in passing the platform at 3 miles an hour. The head guard gives the speed as 8 miles an hour past the north points, 4 to 6 miles an hour past the platform, and 2 miles an hour for the collision. The under guard states 8 to 10 miles an hour at the north points, 4 or 5 in passing the platform, and that they "were going very slowly" when the collision occurred. The station-master considers that the train passed him, as he stood on the platform, at 8 to 10 miles an hour. The pointsman at the north points thinks the train passed him at 15 or 20, instead of the usual speed of 8 to 10 miles an hour. The pointsman at the south points was holding them for the passage of the down train, and neither heard nor saw anything of the up train till he heard the crash of the collision. The engine-driver and fireman of the down train consider that the up train was going, the one at "not exceeding 5 or 6," the other at 3 or 4 miles an hour; and they both state their own speed in the opposite direction at 3 or 4 miles an hour. The guard of the down train, who had received no warning of the danger, and had not applied his break, says that his train was travelling at 2 miles an hour.

The two trains were probably travelling at 4 miles an hour in opposite directions, and a collision equal in force to double that speed was thus produced.

The rails appear to have been in a slippery condition, partly from a slight shower of rain which had fallen half an hour previously, and partly from decaying leaves which lay about on different parts of the line. The engine-driver of the up train, who was a steady man of great experience, came down into the station more rapidly on this account than he intended to do, and he did not reverse his engine soon enough to enable him to stop, as he ought to have done, short of the danger signal which was exhibited on the station platform.

The lengthening of the double line at this station further towards the south, so as to afford more space for stopping the trains, would be attended with considerable expense. It would necessitate the widening of a heavy bank and of a bridge under the line, would cause the removal of the south points to a greater distance from the platforms, which would be inconvenient in working, and would after all be of the less avail, inasmuch as the lengthened portion would be on a descending gradient (towards the south) of 1 in 85. Two other remedies might both of them be employed with much greater advantage.

The more important, as being useful not only on this but on all other parts of the line, is the employment of continuous breaks, enabling each of the guards to apply breaks simultaneously to two or three carriages in addition to his van. I took occasion to recommend the adoption of this system, in consequence of the nature of the gradients, when the line was first opened for traffic; and it appears that many of the carriages are fitted up with the necessary apparatus though it has not yet been used.

One of the printed regulations of the Company directs the guards to apply a sufficient number of

breaks to the trains; but their discretion is left unfettered as to its application. On questioning the head guard of the up train, I find that he would only consider a third break to be necessary if he had more altogether than 16 vehicles; and the guard of the down train states that if he had 13 carriages he should put two break-vans with them, while with 14 carriages he would add three break-vans. Looking to the great length of steep gradients on this line, these guards certainly very much underestimate the proportion of break-power which it is desirable to employ, and the Company will act wisely in now adopting the system of continuous breaks above recommended. They may thus at once treble their break-power, and work with greater economy in wear and tear, and less delay in stopping at stations, without increasing the number of servants with their trains.

A second remedy, which is especially applicable to the Pitlochry station, is that of only admitting one

train to it at a time. The distant-signals are now always kept as a rule at danger, and are only lowered by the pointsmen when they go to work the points at each end, or in the case of crossing trains at the two ends, on the approach of the trains. If it were made a rule only to lower the distant signals one at a time and to keep the down train outside (when the two were approaching) until the up train had been brought to a stand at the station, increased safety would be obtained. And as the distant signals are worked from the points and not from the platform, it would be well to provide a means of communication such as a "bell and arm," worked by a wire between the platform and the points in each direction, so that the pointsmen might work their signals in this manner under the direction of the station master.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you the enclosed copy of Colonel Yolland's report of inquiry into the circumstances connected with the collision at Wigan station on the 20th June last, and I am to request that Colonel Yolland's recommendations may receive the careful consideration of the Directors.

I am, &c.

W. D. FANE.

*The Secretary to the
Lancashire and Yorkshire
Railway Company.*

SIR,

Manchester, 27th July 1865.

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 21st ultimo, the result of my inquiry into the circumstances which attended a collision that occurred between two passenger trains at the Wigan station of the Lancashire and Yorkshire Railway on the 20th ultimo, when about six passengers were slightly hurt.

The up and down platforms of the Wigan station are situated alongside of sidings, so that there are four lines of railway in the Wigan station yard, and all trains which are not appointed to stop at the Wigan station pass up or down one or other of the two central lines, while those intended to stop are turned by signalmen through pairs of facing points on the up and down lines into these sidings. At the west end of the station yard, and just beyond an over bridge that carries the London and North-Western, over the Lancashire and Yorkshire Railway, is a junction of the branch line to Southport, and a signalman is placed in a box close to the north-west wing wall of this bridge, and furnished with regular junction and distant signals, and he also works a short signal near the west-end of the down platform, put up some time since to bar an engine from coming out of a siding lying south of the down line when the line is not clear; but he has no special signal to prevent a down passenger train which has discharged its passengers at the down platform from leaving, as both the trains that run through the station yard without stopping on the down through line, as well as those which stop at the Wigan down platform and then leave for Liverpool or Southport, have to obey the signals which are exhibited at the junction signal box. But the signalman at the junction states, that when he lowers the junction signal for a train to leave the down platform for Liverpool or Southport, he keeps the down distant signal on at "danger," so

as to prevent any through train from approaching the junction while the down train is coming out on to the main line from the siding at the side of the down platform.

On the day in question the 1 h. 40 m. P.M. down train from Manchester to Liverpool, consisting of the engine, eight carriages, and one goods waggon in front, reached Wigan about 2 h. 38 m. P.M. about 13 minutes late, having been delayed at Bolton station waiting for the train from Yorkshire. This train should only stop one minute at Wigan station, but on this occasion it is said to have been delayed five minutes.

It had been the practice up to last April to keep this train waiting at Wigan station until the 2 h. 5 m. P.M. down express train from Manchester to Liverpool, which runs on Tuesdays only and does not stop at any intermediate stations, had passed, and then it followed the express train. But about the time I have named, instructions were given that the 1 h. 40 m. P.M. train should no longer be detained at Wigan to allow the express train to pass it, and the station master on the 20th ultimo gave the order for the train to leave the platform just about the time when the 2 h. 5 m. P.M. express train was due to pass, and up to the day on which this collision occurred the 1 h. 40 m. P.M. train had regularly preceded the 2 h. 5 m. P.M. express train on Tuesdays.

On this part of the Lancashire and Yorkshire Railway the progress of the trains is telegraphed forward and the time of passing various stations is entered in a telegraph book and on a slate, so that the station master or any other person might know what interval of time there was between any two following trains. On this occasion the station master neglected to look at the slate, or, he says he should not have directed the 1 h. 40 m. P.M. train to start when he did; but he states that he was busied with the passengers and with their luggage, of which there was a good deal that day. The evidence is somewhat contradictory as to whether the driver of the 1 h. 40 m. P.M. train did or did not whistle for the junction signal to be taken off. The station master is not certain, but allows that the signal was off for a train to pass through the yard or to leave the down platform; and the signalman at the junction says he did not hear any whistle, but that after he had been told by the ringing of a bell from the eastern end of the Wigan station that the 2 h. 5 m. P.M. down express train was coming, and after a Southport goods train that was shunting on the up Liverpool line had moved away from the over bridge, he got a sight of the Wigan station, and then saw that the 1 h. 40 m. P.M. down train stood alongside of the down platform clear of the central through down main line, and he

then lowered both the distant and junction signals for the 2 h. 5 m. P.M. down express train to pass through the station. Subsequently he saw the station master give a signal for the 1 h. 40 m. P.M. train to leave, and then he put on both the distant and junction signals to "danger," but could not state whether the 2 h. 5 m. express train had passed the distant signal when he turned it on. He saw the steam from the engine, but he could not see the engine itself, and he noticed both trains approaching the junction, the 1 h. 40 m. moving very slow, and these two trains came into collision with each other just as the goods train on the up line was moving under the bridge into the station yard in the opposite direction.

The 2 h. 5 m. P.M. down express train consisted of engine, two first class and one second class carriage, and one van. It received a "caution" signal as it passed Bolton station, $9\frac{1}{2}$ miles from Wigan, and a "danger" signal as it passed Hindley, $2\frac{1}{2}$ miles from Wigan, so that the driver says he almost pulled up, and then the "danger" signal was turned off, which indicated that the previous train had passed five minutes before, and that when he got in sight of the Wigan distant signal, worked from the eastern end of the Wigan station, but in obedience to the instructions of the signalman at the junction signal box, it stood at danger against him, and he sounded the engine whistle and it was taken off. He then proceeded, he says, cautiously down towards Wigan station, and when he entered the station yard the 1 h. 40 m. train was standing alongside of the down platform, at which time he thinks he was not running more than eight miles an hour, and when he was within about three carriage lengths of the other engine he saw that that train was moving. He then whistled for the breaks and did all in his power to stop.

The two engines came into contact with each other just before reaching the over bridge; both were thrown off the rails, and the engine of the express train then came in contact with the waggons of the goods train and knocked two of them off the rails. This engine was then diverted to the left and got partly through the bridge.

The express engine was a good deal but the other engine not much damaged. The sides of the carriages and van of the express train were damaged, but very little injury was done to the carriages in the 1 h. 40 m. P.M. train.

The collision was evidently occasioned by the mistake of the Wigan station master, and the absence of a signal to be worked from the junction signal box to control the departure of a train from the platform at the moment when a through non-stopping train is due to pass through the station, so that the junction signal was actually a signal for both trains to proceed. No blame appears to attach to any other servant of the company.

I had occasion some five years since, when reporting upon a collision at this same station, to make some suggestions as to the arrangements at this junction. These have been partially carried out in concentrating the working of the points and signals by one signalman with the locking apparatus instead of dividing the responsibility between two. But the position of the signal box close to the wing wall is still very far from being a good one, in consequence of the over bridge carrying the London and North-western Railway interfering with the view of the station yard from the signal box.

I believe there are several stations on the Lancashire and Yorkshire Railway where the platforms are alongside of sidings, and where there are main lines along which through trains pass without stopping at those stations. Similar collisions to this one may happen at any of these stations from the absence of platform signals in addition to the usual station signals that properly apply only to the main lines. I think it very desirable that the attention of the Directors of the Lancashire and Yorkshire Railway should be drawn to this matter.

I have, &c.

W. YOLLAND,
Colonel.

*The Secretary
Board of Trade,
Whitehall.*

SIR, *Manchester, 10th August 1865.*

I HAVE submitted to the Directors of this Company your communication of 2nd August instant, handing copy of Colonel Yolland's Report on the collision at Wigan station on 20th June last, and beg to inform you that the Directors have ordered the recommendations therein contained to be carried into effect.

Yours obediently,

WM. S. LAWN,
Secretary.

*The Secretary
Board of Trade,
Whitehall.*

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 15th August 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred near Radcliffe Bridge on the Lancashire and Yorkshire Railway, on the 1st instant, between a passenger train and an engine, and to request that in laying the same before the Directors you will more particularly call their attention to the concluding paragraph of the report, in which Colonel Yolland states it to be his opinion that the propelling of trains up inclines by means of an engine behind is most objectionable.

I am, &c.

W. D. FANE.

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

SIR, *Whitehall, 14th August 1865.*

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 3rd instant, the result of my inquiry into the circumstances which attended a collision that occurred between Bury and Radcliffe Bridge on the East Lancashire Section of the Lancashire and Yorkshire Railway on the 1st instant, when 17 passengers sustained injuries, but it is hoped that none of the injuries will prove very severe.

It appears that when the 10.0 a.m. train from Accrington to Manchester reached Baxenden, the driver of the train heard a noise beneath the engine which caused him to think there was something wrong, and he sounded the whistle for the guard's breaks and stopped the train. On getting under the engine he found that either the driving wheel or the sweep of the crank axle had caught the buckle of the inside bearing spring and swept it from the centre towards the end of the top plate, and he took off the whole of the plates of that spring which were

loose and laid them on the foot plate of the engine, and proceeded on his journey, as he considered that the engine was then in a fit state to go on. When he got to Ramsbottom Station he again examined the engine and found that it was all right, and he did the same at Bury with a similar result. He left the plates of the inside bearing spring at Bury, and desired that another engine might be got ready for him for another train at 2.0 p.m. in place of the engine he was then driving, so that the inside bearing spring might be repaired.

This train, which then consisted of engine and tender and 11 vehicles, including 2 breaks with 2 guards in them, left Bury for Manchester at 10.54 a.m., or 14 minutes late, and when it had got about $1\frac{3}{4}$ miles south of Bury and was travelling it is said at the rate of 30 miles an hour, the driver again heard a noise beneath the engine, and he once more sounded the whistle for the guards' breaks and proceeded to stop the train, and had just if not quite brought it to a stand still, when it was overtaken and run into by an engine with a goods heavy break van behind it, which was following this train from Bury to Radcliffe Bridge for the express purpose of assisting it up the incline of 1 in 120, of about half a mile in length from Radcliffe Bridge to Ringley. The shock is admitted to have been a smart one, although no vehicle was thrown off the rails; but the last carriage, a new first-class, was a good deal damaged, and a second-class carriage in front of it had the body shifted on its frame. The driver (Snape) of the following engine thinks he was running 20 miles an hour when the collision took place, but judging from the effects on the carriages of the passenger train, I believe that he must have over estimated the rate at which he was travelling.

I must now explain how it happened that this engine followed the passenger train so closely. The East Lancashire Section of the Lancashire and Yorkshire Railway not long since lost its locomotive superintendent, and the present superintendent who was then new to the duties and work on the line, gave the following written order on the 26th June to an engine driver of the name of Samuel Ramsbottom, who was temporarily in charge of the Zamiel engine, in consequence of the regular driver of that engine being away from his work on account of illness.

" Lancashire and Yorkshire Railway,
" Locomotive Department,
" Bury, Lancashire,
" June 26th, 1865.

" SAMUEL RAMSBOTTOM, Engineman.

" TAKE Notice that tomorrow (Tuesday) the 27th inst. you will have to bank up the train leaving Bury at 10.40 a.m. from Radcliffe to Ringley with engine Zamiel.

" Yours, &c.

" J. JACQUES,
L. C."

" Acknowledge receipt.

I should also explain that Tuesday is market day, and this particular train is on that day in the week heavier than usual. The engine driver Ramsbottom understood by this order that he was to follow the passenger train from Bury to Radcliffe Bridge, where it is appointed to stop, and then to assist it up the

incline to Ringley, instead of proceeding to his regular work between Radcliffe Bridge and Ringley, and at the proper hour on the 27th June to assist the passenger train from Radcliffe Bridge up the incline. He also understood the order to be a prospective one for each succeeding Tuesday, although it is difficult to comprehend how it could be so interpreted. During the three succeeding weeks he was not working the Zamiel engine on the Tuesday, but the fireman remained with her, and in consequence the same engine followed the 10.40 a.m. passenger train from Bury to Radcliffe Bridge, and from thence up the incline behind the passenger train. On Tuesday the 25th July, Ramsbottom was again in charge of the Zamiel engine and he did as before; and on the 31st July, the regular driver of the engine (Snape) returned to his duty, and on the following morning he was told, both by his fireman and by Ramsbottom, what he was to do; and he proceeded to do it, with the result, a collision, which I have already described.

The driver (Snape) of the Zamiel engine complains that he was not told before he left Bury that something had been found wrong with the train engine at Baxenden, and that the plates of one of the springs had been left at Bury Station. It is quite certain that he did not expect that the passenger train would be stopped before it reached Radcliffe Bridge, 3 miles from Bury, and I think equally clear that he was not keeping a good look out ahead. He says that he followed the passenger train all the way and kept losing ground so that he might be 150 yards behind it when it passed under an overbridge where the driver of the passenger train began to stop his train, and at this point or near it he lost sight of the passenger train; but it is certain that at this particular spot the train in front could be seen from the following engine for a distance of more than 300 yards, and if he had been keeping a sharp look out and was not running, as he states, more than 25 miles an hour, he need have had no difficulty in pulling up with a break on the tender and a heavy goods break behind, without coming into collision with the passenger train.

The collision was evidently caused by the driver's neglect, but the fact is, that the engine should not have been permitted to follow the passenger train from Bury to Radcliffe Bridge at all, much less for 6 consecutive weeks, neither should such an order as I have quoted have been given at all, except in compliance with a requisition from the traffic superintendent, who was actually in the train on the day of the accident, and did not know that any engine had been detailed to assist the passenger train up the incline from Radcliffe to Ringley. Indeed it is very doubtful whether it was required at all on any of those days.

I have only to add that the propelling of trains up inclines by means of an engine behind is in my opinion most objectionable, and almost certain in the event of any mishap occurring to a vehicle in the front part of the train, largely to increase the danger to the passengers.

I have, &c.

*The Secretary
Board of Trade,
Whitehall.*

W. YOLLAND,
Colonel.

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 21st October 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 25th September between a passenger train and a coal train at Miles Platting, and to request

that, in laying this report before the Directors of the Lancashire and Yorkshire Railway Company, you will call their attention to the suggestions made by the inspecting officer relative to the mode of working the Miles Platting incline.

I am, &c.

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

W. D. FANE.

SIR,

*Peterborough,
13th October 1865.*

IN compliance with the instructions contained in your minute of the 29th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 25th ultimo between a passenger train and a coal train, at Miles Platting, on the Lancashire and Yorkshire Railway.

Between the Victoria station at Manchester and Miles Platting there is a steep incline, containing gradients of 1 in 59 for 68 chains, and 1 in 49 for 35 chains in length. On the evening in question, the 6.40 p.m. passenger train from Manchester for Bradford started from the Victoria Station at 6.43, consisting of an engine and tender, two horse-boxes, five carriages, and a van; and it was pushed up the incline by an assisting engine. As it approached the summit the driver of the leading engine observed that the signal was at danger, and he shut off his steam, and whistled for it to be taken off. He shortly afterwards perceived that there was an engine some 20 yards in front of him, and he whistled for the breaks just before he came into collision with it,—at a speed which he describes to have been about 4, but which was more probably 6 or 8 miles an hour.

There were two guards sorting letters and parcels in the van as this train ascended the incline. On hearing the break-whistle from the engine they endeavoured at once to reach their break-handle, but they were thrown down in the attempt. The van and three carriages were coupled together with Fay's continuous breaks, and the body of the van having been shifted on the framing, and otherwise damaged, the break would not act after the collision. Two shocks were experienced, one when the train ran against the engine in front of it, and a second (which was more violent, and from the opposite direction,) when the assisting engine came into collision with the van behind it. The assisting engine was not coupled to the train. The driver of this engine shut off his steam on hearing the driver of the leading engine whistle, and his fireman tried to apply the tender break. He dropped a few yards behind before the train was suddenly brought to a stand, and his engine then necessarily ran against the break-van.

The engines with the passenger train do not appear to have been damaged, any more than the two leading carriages. But the bodies of the third and fourth carriages were shifted backwards by the second shock upon their framings. The fourth, a first-class carriage, which was provided with india-rubber pads between the body and the framing, was not damaged. Out of about 80 passengers, 10 were unfortunately more or less injured, but none very seriously.

The engine with which the passenger train thus came into collision was one of two which were employed to push a goods train up the bank. This train left Salford at 6.10, composed of an engine and tender, 25 loaded and 6 empty waggons, a break-van, and one assisting engine. It was joined by a second assisting engine at the Victoria Station, and proceeded in due course towards Miles Platting, until it was stopped at the summit of the bank by signal, because a goods train which was shunting at the station obstructed the main line. The second-assisting engine of this train was brought to a stand 66 yards outside of the signal, which was itself 60 yards from the hut at the top of the incline. The leading driver of the passenger train states that there were no lights at the back of the tender which he struck, and that as it was quite dark he only discovered it

when he was 20 yards from it. The driver of the last engine of the goods train states that he had placed his gauge lamp on the weather board of his engine, so as to show a red light down the incline, and that there was a lamp at the back of his tender, though he did not look before the collision to see whether it was burning. The fireman admits that it was not lighted, and says the driver told him, in reply to a question on the subject, that as they were only going to the top of the bank (on their last journey for the day) it would not be necessary to light it.

The goods guard states that he was standing on the side of his van for the whole of the seven minutes during which his train was kept waiting before the collision. He saw the passenger train approaching when it was about 200 yards from him, and he held his hand-lamp in the direction of the engine-driver of that train, though he thought the side lamps on his van (which were in front of the assisting engines, and only one of which could have been visible on account of a curve in the line) were sufficient to stop him.

It is plain that this goods train was standing on the incline at a time when the passenger train was due, without any proper signals having been displayed from the tender which was at the tail of it, without any fixed signal behind it, and without any one belonging to it having gone back for its protection. The guard of the goods train and the driver of the second assisting engine are both to blame for not having seen that it was properly protected; and as trains are liable to be stopped in such a position, a distant signal, worked by a wire from the summit, should be erected in a convenient situation, 500 or 600 yards down the incline.

It is for many reasons desirable to avoid stopping the trains on the incline as far as is possible. But at present the confined state of the Miles Platting goods yard renders shunting on the main line continually necessary. The importance of the station will best be understood from the fact that 225 trains pass it, besides special trains and engines, daily. It is very necessary that extra sidings should be formed at Miles Platting, on which shunting may be carried on without obstructing the main line.

The mode of working the incline is far from satisfactory in another respect. An instrument has, it is true, been lately supplied by which the signalman and pointsman at the entrance to the Victoria Station, at the bottom of the incline, is informed of the description of any engine or train that starts towards him from the top. But there is no restriction as to the line being clear, or as to the number of engines or trains that may be upon the incline at a time. The incline being only a mile and a quarter long, the gradients being, as I have already stated, 1 in 49 and 1 in 59, and the traffic being enormous, both as to the size and the number of the trains, it would tend very much towards safety in working if telegraph speaking and train instruments were furnished to the signalmen at the top and bottom respectively, and if they were not permitted to start a train from the summit for the Victoria Station until after the previous train had been safely disposed of there, and vice versa. If it were considered necessary to allow more than one engine or train upon the incline at a time, an intermediate telegraph-box might be established, and the spaces above and below it be worked similarly, on what is called the "block system."

I have, &c.

*The Secretary,
Railway Department,
Board of Trade,
Whitehall.*

*H. W. TYLER,
Capt. R.E.*

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 21st October 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the careful consideration of the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the Report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred on 30th September last at the Sandhills station on that Railway.

I am, &c.

The Secretary of the Lancashire and Yorkshire Railway Company.
W. D. FANE.

*Board of Trade
(Railway Department),
Whitehall, 18th October 1865.*

SIR,

In compliance with your minute of the 12th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances connected with the collision that occurred on the 30th ultimo, at Sandhills station of the Lancashire and Yorkshire Railway.

Several persons are reported to have been injured, but none of them severely.

The exact number is not known.

The Southport branch of the Lancashire and Yorkshire Railway, joins the main line from Manchester to Liverpool, at the west end of Sandhills station. There are four lines of rails in the station; two for the Southport branch, and two main lines.

The Company have been widening and renewing the bridge over the public road at the west end of this station, and in doing so, have removed the junction further to the west, so as to give more platform accommodation.

During the progress of these works, three of the lines of rails were closed, and the whole of the main line and branch traffic was carried for about 300 yards through Sandhills station on one line of rails.

A pointsman was stationed at each end of the single line, and another pointsman at a cross-over road, about the centre of the station. These three pointsmen were all acting under a conductor or pilotman, who was dressed in red, and stationed on the platform, about halfway between the pointsmen at each end of the single line.

The whole were provided with signal lamps, and all trains were ordered to stop at the outside pointsmen, till they allowed them to pass into the station, after receiving a signal to that effect from the conductor on the platform.

A train, consisting of an engine and tender, seven third-class, four first-class carriages, with Fay's continuous breaks, and a guard's van, coupled in the order stated, left Liverpool for Crosby at 11.25 p.m. (10 minutes late), on the 30th September 1865. The lamplighter at Liverpool neglected to put the lamps at the end of the train, and the guard in charge did not observe the omission.

The train travelled all right to Sandhills, which station it reached at 11.30 p.m. It was detained about seven minutes at Sandhills, in consequence of the doors of the carriages not having been unlocked, as they ought to have been, before leaving Liverpool.

An engine and tender on her way to Stable followed the passenger train out of Liverpool, about seven minutes after the passenger train left. It reached the cross-over road to the single line at the west of Sandhills station, whilst the passenger train was still standing at the platform. Though checked for a moment by the red light of the pointsman at the crossing, the driver of the single engine immediately got a white light signal to come into the station from the conductor on the platform and from the pointsman; who repeated the conductor's signal, and told him to go on.

The conductor, was by his own account, 30 yards from the tail of the passenger train; the other evidence makes the distance about 15 yards.

There were gas lamps on the platform, and though the passenger train was without tail lamps, the carriages were lighted with gas.

The conductor or pilot man must therefore have seen the passenger train, had he looked; and it is impossible for me to believe, that if he remained at his post from the time that he admitted the passenger train, that he would not have been aware that it was still there.

I can only suppose that after admitting the passenger train, he left his post for some minutes, and that when he returned, he admitted the single engine without looking down the platform to see whether the passenger train was gone.

The empty engine came on at about five miles per hour, and the driver did not observe the passenger train till he had passed the conductor, and was within 15 yards of the van at the tail of the train. He called to the fireman to apply the tender break, shut off steam, and reversed his engine, but could not avoid striking the passenger train, which he ran into at a speed of about three miles per hour, just as it was moving off. The break wheel of the guard's van was broken, and the back panel damaged. The first-class carriage next to it was shifted on its frame, but none of the vehicles left the rails. Two passengers complained of injury at the time, but all went home, and it is thought that about six others were slightly shaken.

The accident was caused by the conductor or pilotman giving the signal for the single engine to come on, whilst the passenger train was still at the station. Temporary absence from his post, or total absence of mind, and consequent want of thought as to what he was doing, must have been the cause. He has been 19 years in the company's employment, and bears a very good character.

Had the tail lamps been on, it is probable that the collision would not have occurred. The Lancashire and Yorkshire Railway Company have inspectors at Liverpool, to start the trains, and these inspectors are responsible that the trains are in a proper state before they start them. The inspector last on duty leaves about 9.30 p.m. The inspection of the passenger trains which start after that, is entrusted to the guards alone.

I would suggest, that as the guards have other matters to attend to, it would be desirable for the Lancashire and Yorkshire Railway Company, to appoint some person to perform the inspectors' duty after they leave, or to detain one of them on duty till the last passenger train has started.

I have, &c.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision that occurred near the Salford station, on the 10th ultimo.

I have, &c.

J. E. TENNENT.

The Secretary of the
Lancashire and Yorkshire
Railway Company.

Hampton Court,
8th December 1865.

SIR,

IN compliance with the instructions contained in your minute of the 16th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 10th ultimo, between a passenger train and a goods train, near the Salford station on the Lancashire and Yorkshire Railway.

There are sidings north and south of the line on the west of the Salford station. A pointsman, Ryall, 50 yards on the west of the down passenger platform, works a semaphore signal at his cabin, and a distant-signal 400 yards from it on the east of the station. There is a spectacle signal 37 yards to the west of Ryall's cabin, worked by a pointsman, Bosson, whose cabin is 150 yards to the west of that signal; and there is a crossing on the main line 10 yards further to the west from Bosson's cabin.

A special train for the Liverpool races left the Victoria station, Manchester, at 10.42 a.m., 12 minutes late, on the day in question, consisting of an engine and tender, 12 passenger carriages, and two break-vans. These vans were coupled, one at each end of the carriages, the one to two, the other to three carriages by continuous breaks. The engine-driver received a caution signal from a pointsman east of the Salford station, who held up three fingers to intimate to him that the previous train was three minutes ahead of him. But he found the distant signal east of Salford at all right, as well as the semaphore signal on the west of the station. Having shut off his steam in approaching Salford, he turned it on again after passing through the station. But he observed that the spectacle signal beyond Ryall's cabin, and 87 yards west of the down platform, was at danger. He saw a platelayer, also, with a flag in his hand, and he heard a fog-signal explode soon after he passed that signal. It was very foggy, and he could only see those indications of danger for a short distance. But he did his best to pull up, and he reduced his speed from about 10 to 4 or 5 miles an hour before he struck the waggon of a goods train which was crossing the main line at the crossing already referred to, 253 yards on the west of the down platform, and 166 yards on the west of the spectacle signal.

The engine lost a corner of its buffer-beam, and its injector pipe was bent, but it went forward with the train, and none of the passenger carriages were damaged or knocked off the rails. Four of the passengers were injured.

The goods train which was thus in the way of the passenger train arrived on the up line from Preston at 9.45, and was then placed in a siding on the north of the main lines. After it had been there for 20 minutes, the goods inspector went to the pointsman, Bosson, to say that he wanted to have it taken across to the south side, because it blocked up some bleacher's waggons which he was anxious to take down the

hoist (near the siding) and unload without delay. Bosson replied that he could not allow the goods train to come out until certain express trains had passed. Six trains then went by, and the goods inspector came again, after a further interval of about 25 minutes, and repeated his request. He said further, according to Bosson, though he does not himself admit it, that if Bosson did not "turn the train across" he would fetch Mr. Rawson the goods manager to him. The goods inspector then went away and liberated the waggons which he wanted, by moving other waggons in the sidings, without informing Bosson that he had done so. Believing that it would still be necessary to move the goods train, Bosson allowed it to be drawn out on the up line as soon as another train, the 10.30 from Bolton, had passed towards Manchester. While it stood on the up line the 10.15 train from Manchester went by, as well as a train of empty carriages which followed it; and he then arranged with Midgley, another pointsman, to get it across the down line to the south sidings. They thought, indeed, that no time ought to be lost in adopting this course, inasmuch as two coal trains were due, and a passenger train was nearly due, on the up line. But the special race train was also overdue on the down line, and when the goods train, consisting of an engine and tender, 12 waggons, and a break-van, was about half way across, the race train arrived and came into collision with one of its waggons, loaded with coke, as I have already described.

Bosson turned his spectacle-signal to danger, and warned one of the platelayers who were acting as fogmen not to let anything pass till the line was clear, before he allowed the goods train to cross the down line. Ryall, who was 193 yards east of Bosson, and 37 yards to the east of the spectacle signal, saw that signal turned to danger just after he learnt by the sounding of a gong near his cabin from the east of the station that the passenger train was approaching. He had just taken off his signal and distant-signal after the passage of the empty carriage train, and he had no time to apply them again, having no idea that the goods train was about to be shunted across, to stop the passenger train. He placed, however, two fog-signals on the rails, of which one exploded; and this was probably the fog signal which the engine-driver of the passenger train believed to be on the west of the spectacle signal.

The goods inspector was undoubtedly to blame for not informing the pointsmen, when it ceased to be necessary, that he no longer required the goods train to be shunted across from the north to the south sidings. But the special defect in the arrangements which led to the collision was the want of a means of intercommunication between Ryall and Bosson. In the absence of proper information, Ryall was actually taking off his signals for the passenger train to pass along the down line about the same time that Bosson was about to shunt the goods train across that line. I recommend that a bell-and-arm communication be supplied for the use of these men. Ryall ought not to be allowed to take off his signals for the down line till he has first ascertained from Bosson that he may do so with safety. And Bosson ought not to obstruct that line until he has warned Ryall that he is about to do so, and learnt, by receiving permission, that Ryall's signals are at danger.

I am glad to learn that considerable extensions and alterations are in progress in this part of the Lancashire and Yorkshire Railway. I refrain on that account from making further remarks as to the improvements that are required.

I have, &c.

SIR,
I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 10th ultimo, at Miles Platting on the Lancashire and Yorkshire Railway.
*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

I am, &c.,
J. E. TENNENT.

SIR,
Whitehall, 4th Dec. 1865.

IN compliance with the instructions contained in your minute of the 16th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 10th ultimo between two passenger trains at Miles Platting on the Lancashire and Yorkshire Railway.

Miles Platting is at the summit of the incline, a mile and a quarter long, on which the Lancashire and Yorkshire traffic east of Manchester is carried to and from the Victoria station. It is itself an important station, and is the site of the junction between the Ashton branch and the main line. It is passed by 225 trains daily, besides special trains and engines. The main line is at present, from the want of sufficient accommodation, very frequently obstructed by the shunting of the goods trains.

The south main line platform at Miles Platting is 176 yards long, and there is a distant signal 700 yards to the east of it.

On the 10th November the 3.35 a.m. goods train from Normanton, due at Miles Platting at 7.50, reached that station at 10.15 a.m. in a thick fog. Some of the waggons were run forward by hand into the London siding while the remainder, 16 in number, went forward on the straight line towards their destination, Oldham Road. But in the course of this operation, the straight line waggons followed too closely upon the siding waggons. The siding waggons had not gone sufficiently far into the siding to leave a clear passage for those on the straight line. The foremost of the latter struck the hindmost of the former, which was thrown off the rails; and the traffic of the up or south main line thus became temporarily obstructed.

At 10.20 a.m. a passenger train from Middleton, due at 10.18, arrived at the platform, and stopped short of the disabled waggon, which was immediately to the west of it. At 10.24 a passenger train from Oldham, due also at 10.18, drew up at the platform, behind the Middleton train. At 10.25 the 8.50 train from Bradford, due at Manchester at 10.27, following upon the same line of rails, came into collision with the Oldham train opposite the platform and about 50 yards from the end of it.

The Oldham train consisted of an engine and

tender, five passenger carriages, and a break-van. The guard, who was standing by the side of his van when the collision occurred, states that he could not see more than nine yards for the fog, and that there was a platelayer 80 or 100 yards behind his train, whom he had seen in passing. The station inspector told him to draw down, and his train was about to move forward when it was struck. One first-class carriage of this train was damaged. The return of the company states that two or three persons were shaken, but I only heard on the spot of one lady having complained of injury.

The Bradford train started punctually from that station at 8.50, and the engine-driver found the Miles Platting distant-signal at danger, and saw a platelayer (acting as a fogman) near it with a green flag in his hand. The platelayer said nothing as the train passed him, but one fog-signal which he had placed on the rails exploded.

The train was then travelling at a speed of about eight miles an hour, and the engine-driver proceeded still more slowly towards the station until at 10 or 15 yards (as he thinks) from the platform he saw a second platelayer, also acting as a fogman. This man had no fog signals on the rails, but said something to the fireman, who was on the side of the engine next to him, in passing. The fireman turned to the engine-driver, who was on the other side of the engine, and said, "Go on, the train has gone away." The engine-driver turned on his steam again to draw up to the platform, and then saw the break-van of the Oldham train "about 10 yards" in front of him—too late to be able to pull up.

The platelayer in question states that he was 200 yards behind the Oldham train when the Bradford train passed him. He had used fog-signals to caution the Middleton train and the Oldham train, and he had placed one on the rail in front of the Bradford train, but it had dropped off again, and that train reached him before he could get another out of his pocket. He was not aware that the truck was off the line on the west of the station, but he knew that the Oldham train had not had time to go forward and must be at the platform. He therefore said, according to his account, to the fireman, as the Bradford train passed him, "Hold on, there is a passenger train standing at the station."

It would thus appear that the collision occurred in consequence of a misunderstanding on the part of the fireman of the Bradford train of what the platelayer said to him, by his interpreting the "hold on" of the platelayer to mean "go on," and so translating it to the engine-driver. And the fireman gave me the impression, when I examined him, of being a man not unlikely to have made such a mistake. But the platelayer ought, according to his own showing, to have employed his red flag instead of contenting himself with speaking to the fireman as the engine passed him. It would have been better if the station master had, as soon as the waggon got off the line, warned the platelayer of the circumstance, as the platelayer would then, no doubt, have been more energetic in his endeavour to stop the Bradford train.

I am glad to learn that an alteration is to be made in future in the company's time bills in regard to the

Oldham and Middleton trains. These trains are joined together at a previous station and arrive at Miles Platting as one train on all days of the week but two. It is only right that as they arrive separately on those two days, an interval should be allowed between them, instead of their both being appointed to be at Miles Platting, as at present, at 10.18.

But the principal lesson to be drawn from this collision, is the want of extra sidings at Miles Platting in which shunting may be performed with the goods trains clear of the main line. I had occasion to draw attention to this subject in my report of the 13th October last, upon the collision that occurred between a passenger train and a coal train; the latter having

been stopped upon the incline while a goods train was shunting at the Miles Platting station. In this case, again, the passenger train was checked because a goods truck was thrown off the rails in shunting on the main line. The importance of the station, its position, and the magnitude of the traffic require that the above remedy of extension and re-arrangement should be applied with as little delay as possible at Miles Platting.

I have, &c.

H. W. TYLER.

Capt. R.E.

Board of Trade
Whitehall.*

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 5th Dec. 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade, to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred near the Elland station on the 15th ultimo.

My Lords trust that the Directors will give Captain Tyler's recommendations their careful consideration.

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

I am, &c.
J. E. TENNENT.

SIR,

Derby, 30th November 1865.

IN compliance with the instructions contained in your minute of the 17th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision which occurred on the 15th instant between a passenger train and a goods train, near the Elland station, on the Lancashire and Yorkshire Railway.

A single line from Halifax, a mile and a half long, joins the main line of the Lancashire and Yorkshire Railway at the North Dean junction, 31 miles from Manchester; and the Elland station is 1,300 yards south of North Dean, on the way to Huddersfield. The line between North Dean and Elland is nearly level, but passes through a tunnel 434 yards long, of which the north end is 500 yards from North Dean, and the south end is 374 yards from Elland. There is a distant signal 161 yards north of the tunnel, worked from the Elland station, and there are semaphore signals on the passenger platform at that station. There are also the usual main signals and distant signals at the North Dean junction, at which there are passenger platforms and a very considerable traffic.

The 10.30 A.M. express passenger train left Halifax one minute late on the day in question for Huddersfield, consisting of a tender, an engine, three passenger carriages, and a break-van. It was not due to stop either at North Dean or at Elland, and the branch pilot-man, who usually travels with it as far as North Dean, followed on a goods train; so that it was not necessary for the engine-driver to slacken speed at North Dean to allow him to drop off. The North Dean signals were lowered in due course for this train to pass the junction, and it ran through at a speed of 12 miles an hour. The junction signalman held up a green flag in one hand, which the engine driver observed, and showed (he says) his extended thumb and four fingers with the other

hand, to indicate that the previous train was five minutes ahead, which the driver does not appear to have noticed. The distant signal from Elland (north of the tunnel) was at *all right*, and, the driver having turned on his steam again, the train passed through the tunnel at a speed of 15 miles an hour. On coming out again at the south end of the tunnel he found a goods train in front of him, at too short a distance to enable him to pull up. His tender struck the van of the goods train with great violence.

The tender was much damaged. The tank was crushed, the framing was doubled up, and the wheels were knocked from under it. The body of one (first-class) carriage was shifted on its framing. The van of the goods train was destroyed, three of the waggons were knocked to pieces, and others were damaged. The guard of the goods train had, fortunately for him, ridden on a waggon, third from the engine, through the tunnel. The engine-driver, fireman, and guard of the passenger train, and seven passengers, were more or less injured; but they were all, I was happy to learn, progressing towards recovery.

The goods train which was thus in the way of the passenger train, had reached North Dean at 9.35 from Normanton, and had commenced shunting immediately, to prepare for the return journey. After disposing of its waggons in the up sidings, and making up a fresh train from the down sidings, composed of an engine and tender, 37 waggons, and a break-van, it was ready to start again for Normanton soon after half-past 10; but the circumstances under which it then left North Dean form the subject of much conflicting evidence.

The junction signalman states that the engine-driver, having drawn past his signals in shunting, went away without giving him notice with his engine-whistle; that he hollered to him, "The Halifax to Huddersfield express is due—you must put back clear of the junction;" that he waved his hands up and down (while his back was turned to him) as a signal to him to stop, without being able to get his attention; and that he did not lower his signal for him to pass. He adds that there was an interval of five minutes exactly between the starting of this train and the passage of the passenger train past his junction, which is not likely to have been the case. The distance from the junction to the collision was only 1,084 yards. The goods train may have taken, and is said to have taken, four or five, while the passenger train would have taken perhaps two minutes, to run that distance; and there would thus have been an interval of not more than three minutes between them at the junction.

The ticket-collector, who is also foreman-porter and acts as inspector under the station master, corroborates the above statements of the signalman, that the engine-driver of the goods train went away without permission, without whistling, and without

the signal having been lowered; and that there was an interval of five minutes between the two trains, from 10.31 to 10.36, by his watch. It did not occur to him to check the express train, "because he did not know it was so nearly due." He saw the station-master standing on the platform near the porter's room door talking to two gentlemen as the goods train went away.

The station master states that he saw the goods train shunting at the station at 10 o'clock, that he went to the stables and to a pair of points not far from them and near the end of the branch platform, that he was at those points when the express train passed, that he then went into the warehouse to show the warehouse siding to a new porter, Dixon, who had arrived by the 10 o'clock train, and that going into the goods office he there received a telegraph message that the collision had occurred. He denies that he saw the goods train start, and states that he thought it was still in the siding when the express went by.

The porter Dixon, to whom the station-master refers to corroborate his statements, states that the station-master followed him into the goods yard shortly after 10 o'clock, and showed him round the sidings &c., and he gives a version of the course which they took quite different from the statements of the station master. He did not see the goods train go away, but thinks that he and the station-master must have been within 30 or 40 yards of it when it started. He agrees with a goods-clerk and a telegraph clerk that the station-master did not go into the goods office, but received the message reporting the collision outside the office and in the warehouse.

The engine-driver, fireman, and guard of the goods train all state, in opposition to the above evidence, that the ticket-collector (inspector) came to the engine when the train was made up, asked if they were ready to start, and told them to do so; and that the engine-driver whistled accordingly for the junction signal, which was lowered for them to pass. They all agree further, that the station-master was standing talking to a gentleman near the door of the porter's room on the platform when they started, and that he saw them go away.

After hearing all the evidence that was produced in regard to these questions, I have come to the conclusion that the statements of these three men are correct, and that the station-master, the ticket-collector, and the signalman are to blame for having allowed the goods train, which was booked to stop

at Elland, to proceed in front of the express train from Halifax which was not timed to stop there. They were also to blame for not having, after the goods train had started, taken proper steps to warn the engine-driver of the express train that such a train was in front of him. They ought in common prudence to have done this just as much if the goods train had started without their sanction, as if it had gone with their permission. And, indeed, if it had gone, as the ticket collector and the signalman allege, in opposition to their wishes or injunctions, they would have been in that case the more likely to have realized the danger of allowing the passenger train to follow it so closely, to have checked that train by their signals, and thus to have prevented the collision from occurring.

In order to prevent such accidents from happening in future it is extremely desirable that the block-system of telegraph should be introduced between North Dean and Elland. The signalman at Elland cannot protect a train in the usual way by means of his distant-signal after it has passed that signal, because he cannot see it until it comes out of the south of the tunnel. And it is not right that any engine or train should be allowed to leave North Dean for Elland until the previous engine or train has been telegraphed clear from Elland, or vice versa.

The engine of this express passenger train was running tender first, for want of a turntable at Halifax, which should be supplied without delay.

The guard of the goods train being a spare, or relieving guard, was not supplied with a time-piece, though he is required to note his times of arrival and departure; and he had not applied for one because other guards in a similar position are not so provided. The means of ascertaining the correct time at the different parts of their journeys are quite as necessary to these men as to the regular guards.

A raised stage, with levers for working all the neighbouring switches from that stage, and locking apparatus, as well as telegraph-instruments, are much required at North Dean. The view of the signalman is much obstructed there at present by the waggons in the siding.

I have &c.

H. W. TYLER.

W. D. Fane, Esq. Capt. R.E.
Board of Trade.
Whitehall.

LANCASHIRE AND YORKSHIRE RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 5th Dec. 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed Copy of the report made by Captain Tyler, R.E., of his inquiry into the circumstances which attended the accident that occurred on the 25th ultimo, near the Wigan station of the Lancashire and Yorkshire Railway.

The Secretary of the
Lancashire and Yorkshire
Railway Company.

I am, &c.

J. E. TENNENT.

SIR,

Manchester, 29th November 1865.

In compliance with your instructions I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 25th instant near the Wigan station on the Lancashire and Yorkshire Railway.

The lines of the London and North-Western and the Lancashire and Yorkshire companies are very near to each other at Wigan, and there is a short junction line between them half a mile to the south of the Lancashire and Yorkshire station, which line is used principally for the interchange of mineral, but occasionally also for that of passenger traffic. The signalman of the Lancashire and Yorkshire Company at this junction has control over the traffic with the neighbouring sidings connected with the Lancashire and Yorkshire Railway. One siding, called the *short siding*, between the main lines of the two railways, is provided with a scotch block 94 yards to the south of the junction cabin. A portion of this siding is level, but the remainder rises slightly towards Wigan, to join the main line of the Lancashire and Yorkshire Railway. The points which connect it with the main line are worked by a rod from the junction cabin.

On the afternoon in question the 5.30 passenger train from Manchester (via Bolton and Wigan) to Liverpool started from the former station about three minutes late. It consisted of an engine and tender, 12 carriages, and two break-vans, and was approaching the Wigan junction above referred to about 6.55,

at a speed of perhaps 20 miles an hour, when the engine-driver heard a crash and felt a violent shock to his engine. The night was dark but clear. The driver fancied he saw something dark by the side of his engine, and, looking back, he saw the carriage next behind the tender leave the rails. He whistled for the breaks, and observed as he passed the London and North-Western Junction line that the carriages appeared to go in the direction of that line, and "turn over," while the engine broke away from them and ran forward. After coming to a stand, he started again to obtain assistance from the station.

The engine had its buffer broken, and its injector pipe bent, and the axle boxes of the tender were fractured. A goods waggon lay across the end of the siding somewhat damaged on one side, and with a spring gone from each side, but with its wheels under it. Four carriages and a break van were thrown off the line and turned over, three on their sides and one on its end, while the other nine vehicles remained on the rails. One passenger, who appears to have fallen from the first carriage as it turned over, was killed on the spot, and five others have complained of injury.

There was a strong wind blowing on the evening in question from a south-westerly direction, and there can be no doubt that the accident was caused by the truck which was thus found at the end of the siding having been blown along it towards the main line, and sufficiently near to the points for the engine to strike its side in passing. The leading carriage having been thrown off the rails as the truck swung round, and its progress having been obstructed by the points and crossings which it encountered, the engine unfortunately broke away from the train, and the momentum of the carriages in the rear contributed to damage and overturn the carriages in front, and to cause loss of life and injury, as above described, to the passengers.

There had been two waggons in the siding before 3.40 on that afternoon. But at that hour a coal train, called Blundell's train, was stopped at it while the engine was backed into the siding, a waggon was drawn out, and after being attached to it was taken on with the train. The guard of the coal train believes that he found the scotch-block open when he first took the engine into the siding, and he admits that he went away and left it open after he had drawn the waggon out of it. He is in the habit of going sometimes two, three, or four times a week, as the case may be, into the siding, and he shuts the scotch-block before he leaves it when he can conveniently do so, but leaves it open when he is hurried away.

On the present occasion he did not wait to shut the scotch-block because the 2.40 express passenger train from Manchester was overdue behind him, and he was anxious to get his train out of its way as fast as possible. He was in the habit of warning the pointsman after dark when he left the scotch-block open, but not during daylight; and it was daylight when he took the waggon out of the siding at 3.40, though it had become dark $3\frac{1}{4}$ hours afterwards when the accident occurred.

The guard cites No. 226 of the company's printed regulations, which directs the guards to attend to the security of private or other sidings where there is no man stationed "for attention to the signals being properly shown," and "for seeing the scotches turned across the rails," as a proof that the pointsman rather than himself was properly responsible for seeing that the scotch was applied in this instance; while the pointsman asserts on the other hand, that he has never considered it to be any part of his duty to look after it. The pointsman states, indeed, that the guards have sometimes put it on, and sometimes they have not, and that in the latter cases it has been "left off." He states further, that he cannot leave his post by day, because he has no signals for the sidings, and that the goods drivers would be liable to come out upon the main line during his absence at the siding, when he would be unable to show them a red flag.

The pointsman (or signaller) who has taken night duty at the junction for the last three years, says "I always ask the guards when they leave the "short siding at night whether they have put the "scotch-block on. If not, I put it on myself. I am "never on duty there by day; I have never had "any orders about it, or lock and key to it. I have "myself put it on many times when the guards "have omitted to do so."

The above regulation is, no doubt, so far in the guard's favour, and it would naturally have been a great object to him, as well as very necessary on the score of safety, to get away from the siding as quickly as possible when an express passenger train was overdue behind him. The pointsman, also, has some reason in urging that it is difficult for him, under present circumstances, to leave his post and attend to a scotch 94 yards away from him. But he might surely have found an opportunity of turning it across the siding between 3.40 and 6.55 if he had desired to do so; and any man anxious about the safety of the traffic would have taken care to make the siding secure, at all events on so tempestuous a night, whether it was within the strict line of his practice or duty, or whether it was not. It would appear that as the siding does not fall towards the main line, this man, who is always on day duty, and has been so for seven years, did not concern himself, in the midst of his other duties, about the position of this scotch at all, and that it did not occur to him that the accident would be likely to happen. When he first heard the crash, and was struck by some of the debris, he ran away to make his escape from he did not know what; and in going afterwards to ascertain what was the matter, he "heard from the guard that a telegraph pole had got in the way." He did not remember when he had last seen the scotch before the accident.

Rule No. 77 of the company's printed regulations, addressed to station masters, clerks, and their assistants, directs, that "when carriages or waggons have "been placed in a siding, care must be taken that "the scotch blocks are placed across the end of the "siding; and when the siding inclines towards the "main line the breaks must be pinned down and the "wheels locked so as to prevent the possibility of "their slipping or being blown down upon the main "line." It is to be inferred that the junction signaller, who is the station master's assistant in this matter, should have obeyed this rule as regards the scotch. But, inasmuch as the siding did not fall towards the main line, it was not incumbent upon him under this rule to pin down the breaks of waggons left upon it.

On the 1st November 1861, however, the company issued a printed notice, copy of which I enclose. It is a renewal of an old instruction, No. 103, and it "states that "in all cases where stop-blocks are affixed "to sidings the same shall be kept locked, and the "key retained in possession of the person who has "charge of the siding." It further states that "in all "cases where there are waggons or carriages, &c. in "sidings the breaks must be put down before leaving "them; or, should they be without breaks, spraggs "must be used, or the wheels chained to the rail, so "as to prevent their running out of the siding." And it is notified that any neglect in carrying out this instruction will be very severely dealt with.

The signaller above referred to had no copy of this order, and did not remember to have received it; and he could not have carried out that part of it which referred to locking the scotch (or stop-block) because he had not been provided with a key for the purpose, and there was no hasp, staple, or lock of any sort upon the scotch.

It is desirable that he should now be provided with a lever and rods for working the scotch from his cabin. He would thus be able to secure the safety of the siding without leaving his post. It is the more necessary that the scotch should be controlled by the signaller, because the engine-drivers

of Messrs. Pierce and Knowles, private owners, come into the siding (and sometimes leave the scotch open) as well as those of the Lancashire and Yorkshire Company.

I am glad to learn that orders have been given for the erection of signals to guard the sidings near this junction; and I would take the opportunity of strongly recommending that a raised stage should be con-

structed, with locking apparatus, and all those accessories to safety which are now provided at such posts.

I have, &c.

H. W. TYLER,

Capt. R.E.

W. D. Fane, Esq.
Board of Trade,
Whitehall.

LANCASHIRE AND YORKSHIRE RAILWAY.

Board of Trade
(Railway Department),

Whitehall, 26th January 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the falling of the viaduct at Mytholm Bridge on the Holmfirth branch of the Lancashire and Yorkshire Railway on the 3rd ultimo.

The Secretary of the

Lancashire and Yorkshire
Railway Company.

I have, &c.

W. D. FANE.

SIR,

No. 1, Whitehall, 22d January 1866.

IN compliance with the instructions contained in your minute of the 23d ultimo, I have now the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the fall of the viaduct at Mytholm Bridge on the Holmfirth branch of the Lancashire and Yorkshire Railway on the 3d ultimo.

The Holmfirth branch of the above railway, $1\frac{3}{4}$ miles long, was opened for traffic in June 1850. The viaduct in question, about a mile from Holmfirth, was originally constructed of timber, but on masonry foundations. It was divided into 26 bays, each having a span of 20 feet 6 inches, and was, including the abutments, about 200 yards long, with an extreme height of $85\frac{1}{2}$ feet to the level of the rails. In 1864, the company determined to renew it in masonry, and the contract was taken by Mr. Henry Wadsworth for the low sum of 7,100*l*. Mr. Wadsworth signed the specification, copy of which I enclose, on the 4th July 1864, and the plans on the 20th of the same month. The accompanying plans, with which Mr. Meek, the engineer of the company, has been so good as to furnish me, are tracings of the original plans signed by himself and the contractor. They show, as will be observed, the principal details of both the old and the new viaduct, and the manner in which the piers of the latter were to be constructed immediately between those of the former.

The viaduct was on an irregular curve of about 20 chains radius. In order to obtain an equal span on each side of the arches, the ends of the piers on the outer side of the curve were $11\frac{1}{2}$ inches wider than those on the inner side of the curve. The new piers were to be 27 feet long at the top, 4 feet thick at the top at the narrow end, and 4 feet $11\frac{1}{2}$ inches thick at the top at the wide end, with a batter of $\frac{1}{4}$ of an inch to the foot on each side and at each end. They varied, therefore, at their base in length and breadth according to their height. The footings were to be in two courses of 12 inches each, projecting 6 inches on each side for each course. The piers were to be sneaked on the face, with a through-stone in every square yard of surface, and the viaduct was to be built of "good rubble stones," with "imposts, corbels, " string-course, and coping of tooled ashlar." There were 11 arches, each with a span of 37 feet 8 inches, and a rise of 18 feet 10 inches, and 2 smaller arches, each with a span of 29 feet, and these were all to be

2 feet thick, "of pierpoint masonry, with pitched ace " voussoirs, and backed up with rubble masonry."

Mr. Kershaw, an inspector of 15 miles of railway, in whose district the viaduct lay, was employed to superintend the construction of the work without any increase to his salary of two guineas a week. He had first, according to Mr. Watts, been a staff holder in levelling, and was then employed in fixing the profiles of tunnels, where he was found very useful. He then learnt to level and take a section of ground. He had never been employed before in the construction of a bridge or a viaduct, but had been in charge of the permanent way and works on the line between Penistone and Huddersfield, and on the Holmfirth branch since July 1864, and had been "applying for an advance." Mr. Watts, the assistant engineer of the company, explains that "this work was given to him as a means of " getting him an advance, and if it had been successful, he *might* have got 30*l*. or 50*l*. a year more, " as a compensation for the superintendence of the " viaduct." He gave a month's notice after the viaduct fell, and at the expiration of that period left the company's service.

I had not an opportunity of examining Mr. Kershaw on the spot, but I learnt from Mr. Watts that a letter was forwarded to him on the 13th instant, informing him that I should make my inquiry on the 16th; and I requested Mr. Watts further to inform him that I should be happy to receive anything in writing which he might feel inclined to send me. I have since received a letter from him dated the 20th instant, which I herewith enclose. He was required to report to Mr. Meek every fortnight on the state of the permanent way and works in his district, and Mr. Watts states that his reports have been, as regards the viaduct, of one uniform character, that the work was progressing satisfactorily up to within a few days of its fall. That this was the case will be seen from the enclosed extracts from his reports, the last of which is dated 30th November 1865, four days before the viaduct fell. He therein reports "the " filling and ballasting done for one line," and that he is "laying the new road." In addition to Mr. Kershaw's superintendence, it appears that Mr. Meek visited the work three times, and Mr. Watts every month or six weeks, or "about half a score" of times between July 1864 and December 1865.

After the plans had been signed, Mr. Meek acceded, at Mr. Wadsworth's request, to the substitution of Yorkshire lime for Halkin Mountain lime provided in the specification, and a saving of something like 56 per cent.* is stated to have been thus made by the contractor in that important item.

In making my inquiry, I first inspected the site in company with the gentlemen of the Chamber of Commerce at Holmfirth, who have memorialized their Lordships, and others interested, as well as with Mr. Watts, Mr. Wadsworth the contractor, and his brother who had assisted him. I afterwards examined all who afforded me opportunity at the Huddersfield Railway Station.

The site presented a scene of complete ruin. The mortar had evidently been of bad quality, and there

* Mr. Meek has since explained that though there was no agreement on the subject, it was not his intention that the contractor should ultimately benefit by this alteration.

was an entire absence of cohesion between the parts of the fallen masonry. The timbers of the original viaduct protruded in various positions, but mostly falling towards near the centre, from a long line of rubbish across the valley.

The work was commenced in July 1864, almost immediately after the plans had been signed. As regards the foundations, Mr. Kershaw states simply that "they were all taken to the depth as shown upon the plan, and 5 of them below, to such a depth as I and the contractor thought sufficient." The evidence of Mr. Wadsworth as to the manner in which they were put in is, as will be seen, highly important.

Mr. Wadsworth states that the foundations of No. 7 pier (from Huddersfield, about 80 feet below the level of the rails) were about 5 feet below the surface, half on rock and half on gravel, longitudinally. "There was rather more rock than gravel at the thick end, and rather more gravel than rock—very little rock—at the thin end of the pier. No one but Mr. Kershaw knew of this, and Mr. Watts and Mr. Meek never saw it. I thought, perhaps, that might be sufficient at the time. It was pretty hard gravel, but I believe the water was under it. It was not for me to say exactly what depth I should go. I went to the depth required by the plan and specification. Nos. 6, 5, 4, piers were also half on rock and half on gravel, but in a different way, the thick end having been all rock, and the thin end having been all gravel. The south ends of the piers were all thicker than the north ends, on account of the curve in the viaduct, of which the radius was about 20 chains. It therefore happened that the thicker end of the piers had the stronger foundation, and the thinner end of the piers had the weaker foundation," or, in other words, the footings on the weaker were considerably less in area than the footings on the stronger foundation. Mr. Wadsworth adds, "I did not remonstrate against this state of things. I merely carried out the work according to my plans and specification, or, when I departed from them, by going deeper with the foundations, under the direction of Mr. Kershaw." And he states, with regard to the other piers, that Nos. 1, 2, and 3 were on mixed shale and clay, No. 8 was on gravel, No. 9 was on shale, and the deepest they went down was with No. 10 pier, which was 12 feet below the surface.

Mr. Wadsworth first began to observe symptoms of failure in No. 7 pier after he had got the centres set, ready for turning the arches. "It began to draw towards No. 8 under its own weight. We thought it would not go far, and allowed it to remain as it was for a long time, until the arches were turned. We noticed it continuing to go, and Mr. Kershaw thought it advisable to put up some buttresses, and ordered me to do so. I put up the buttresses under his directions, and Mr. Watts came down before they were quite finished. I was not there, and did not see Mr. Watts. There was a little settling at the narrow ends, also, of Nos. 8, 5, 4, and 3 (piers) after the arches were built."

Mr. Watts noticed certain cracks in No. 7, 8, and 9 piers when they had been built up to the springing course, but says "they were small and did not give me any alarm." He learnt, however, from Mr. Greenup, the sub-contractor for the timber-work, about the 31st October, that buttresses were being constructed against No. 7 pier, and he went out to visit the work without notice. He found that this was the case, and "the cracks were a little worse." "They had been pointed up, and were to some extent concealed from his view." He did not think there was any danger, but he "ordered Mr. Kershaw to watch the pier very minutely, and to let him know in case he saw any further movement." It will be observed that Mr. Kershaw states in his letter with regard to this visit, "Mr. Watts coming at the time said, 'I don't see that you could have done anything better.'"

In visiting the viaduct a week after, Mr. Watts

saw no change. He had No. 7 pier plumbed by an assistant from the engineer's office, and found that it had bulged half way up to the extent of an inch and a quarter. He also noticed slight bulging in No. 8 pier. "He felt satisfied that there would be no further danger if there was no further movement," and trusted to Kershaw to give "him information." He "saw the viaduct about ten days before it fell," but without discovering any great changes in it, or "any movements to lead him to apprehend danger."

Mr. Watts now believes that he was deceived by Mr. Kershaw's "plastering up cracks, and not reporting to him," and that there were cracks pointed up which he did not discover. And he states that when he visited the viaduct with Mr. Meek "in the frost of last winter," after receiving an anonymous letter, "they were dissatisfied with a portion of the work, and ordered 4 feet to be pulled down from 3 or 4 piers at the Huddersfield end," as well as "more through stones to be employed, and better mortar to be used," trusting to Mr. Kershaw to see these things done. It appears, however, from the statement of Mr. Wadsworth, that he heard nothing of the order as regards the piers, and that certainly they were not pulled down as so directed.

In regard to the condition of the works from time to time, I received the evidence of several other gentlemen.

Mr. Holmes, a woollen manufacturer, of Holmfirth, met Mr. Barrowclough, an architect of the same place, at the viaduct (where they were on other business) on the 28th October 1865. Mr. Holmes then observed that No. 7 pier was cracked up each end, and in several places along the face, and he noticed that No. 8 pier had bulged.

Mr. Barrowclough has "passed through the viaduct, and noticed the piers once or twice a week ever since the work commenced." He had frequently, before the 28th October, seen men with ladders pointing up Nos. 5, 6, 7, 8, and 9 piers. On that day he pointed out to Mr. Holmes that Nos. 7 and 8 piers had "given way very badly." He then saw stones, which had been pointed up before, fractured in fresh places, and No. 8 (the highest) pier was "bulged to the extent of 4 or 5 inches." About the 1st November he visited the viaduct with Mr. Moorhouse, and they saw a man with a ladder pointing up Nos. 5 and 6 piers. He had never seen any through-stones used in the piers. He had been "on the scaffolding 5 or 6 times on Sundays," and he "found one Sunday on examination" that the "stones in the interior of about No. 7 pier had been put in dry without mortar." He examined it specially, because he heard that such had been the case. He noticed also that the lime was of bad quality, such as he "would not use for any work." He saw the viaduct for the last time four days before it fell, and noticed that Nos. 7 and 8 piers, but particularly No. 7, were "getting worse," and the cracks opening afresh, though he did not see that the bulging of No. 8 had increased.

Mr. Lockwood, a farmer, who lives 200 yards from the site of the viaduct, has seen "the men making up" cracks in Nos. 5 and 6 piers week after week. He also saw them fill up a crack at the wide end of No. 7 pier with stones as well as mortar. He says, "About four o'clock on the Saturday afternoon before the viaduct fell (which it did on Sunday morning), I passed it on my way to the field and back again. I noticed that No. 7 pier was giving way on the Huddersfield side. I saw it bulging out in three places. One was near the top, and the others below it, but above the abutments (buttresses), and nearly the whole width of the face. I told the miller, William England, about half past 4 the same afternoon, that the pier seemed to be giving way, and that it would not stand long." It appears that Mr. Lockwood had sought employment from the contractor, and from his brother, and been refused it as being too old; but his statement as to what he told the miller, William England, on the

afternoon before the viaduct fell, is corroborated by the latter.

Mr. Wimpenny, of Stoney Bank Mills, 300 yards from the viaduct, had seen the piers several times a week from the commencement of the new viaduct. No. 7 was the worst. Nos. 8 and 9 were also cracked. He saw that "they had pointed them up from time to time."

Mr. Moorhouse, a gentleman residing nearly a mile from the viaduct, visited it with Mr. Barrowclough a fortnight or three weeks before it fell, and saw a man with a long ladder making up cracks in some of the piers. He has "frequently walked under the viaduct and seen the cracks being made up," and has "seen a crack as much as five inches wide in No. 7 pier." He "looked for through-stones, because it was a regular talk that there were no throughs, but he did not see any." He "saw them putting in tailed stones, or stones which went half way through the piers, but none which went quite through, excepting at the top of the piers under the springing-course." The piers were filled up with rubble-stone, which was "put in, levelled down, and covered with mortar." He did not see any built dry. He "saw some of the foundations put in near Nos. 7, 8, and 9 piers, and the work appeared to be well done; it was a dry season."

I should observe here that the through-stones referred to in the specification were explained by Mr. Watts as meaning merely stones laid transversely from face to face of the piers in two or even three pieces. Mr. Watts states that some of the stones in the work would have answered the specification "perhaps one half of what they ought to have been."

The evidence which I have received can only lead to one conclusion. No. 7 pier was founded longitudinally on part rock and part gravel. When this foundation was subjected to a sufficient weight, the pier split longitudinally, the portions on the rock remaining firm, and the portions on the gravel settling down. The statements as to the cracks at the ends tend strongly to confirm the evidence of Mr. Wadsworth as to the character of the foundation of this pier. The buttresses which were applied to it had but little effect in checking this action, and as soon as the viaduct was loaded with ballast on one

side, in readiness for the permanent way, and while it was being prepared for traffic, this pier failed altogether, and the whole mass crumbled into ruin.

The inquiry cannot be considered to be by any means complete, without an examination of the foundations themselves, and of such parts of the work as may be visible when the debris has been cleared away. I should be glad to have an opportunity of visiting the spot at a future time when this has been done, and the foundations of No. 7 pier have been opened out. In the meantime, the point to which it is my duty particularly to direct their Lordships' attention is the very inefficient superintendence which the work received on the part of the Lancashire and Yorkshire Company. A viaduct of rubble-work requires especial care in construction, as regards the quality of the mortar, and, generally, in superintendence. These elements of security were all wanting. The lowest—a very low—tender was accepted for its construction. The foundations were put in entirely, and the work progressed, for the most part, under the inspection of an officer who was evidently, whatever may have been his good qualities, quite unfitted to the task, and without such a salary as could be expected to render him independent. The company, indeed, paid nothing specially for its superintendence, inasmuch as it was placed under the charge of the inspector of the district of 15 miles in which it happened to be. And this niggardly mode of carrying on the work must be assigned as the principal cause of failure, and of the awful risk which was occasioned to the public, who travelled regularly over the viaduct up to the time of its fall.

I think it only right to recommend, in conclusion, that as the inhabitants of Holmfirth are deprived by the fall of this viaduct of the advantages of the communication with Huddersfield and other places by railway, which they have now possessed for many years, and as they have no other railway to the town, a temporary viaduct should be erected with as little delay as possible, pending the completion of a permanent structure.

I have, &c.

H. W. TYLER,
Capt. R.E.

The Secretary of the
Board of Trade,
(Railway Department),
Whitehall.

LONDON AND NORTH-WESTERN RAILWAY.

Board of Trade
(Railway Department),
29th July 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-Western Railway Company for their consideration, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the accident on the 28th of June last in the tunnel on the north of New Street station, Birmingham.

I am, &c.,

W. D. FANE.

The Secretary to the
London and North-Western
Railway Company.

Broadstairs,
26th July 1865.

SIR,

IN compliance with the instructions contained in your minute of the 11th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 28th ultimo, in the tunnel on the north of the New Street station at Birmingham of the London and North-Western Railway.

This tunnel is about $\frac{3}{4}$ of a mile long, and on a gradient rising from the New Street station of 1 in 70. It is worked by telegraph, as I have before had occasion to report, and only one engine or train is permitted to be in it upon either line of rails, though any two engines or trains are permitted to be in it, one upon each line of rails, at the same time.

The tunnel has been under repair for three years. Defective portions of the brick arch with which it is lined, are taken down and rebuilt in lengths of four feet, the workmen being employed between 11 o'clock at night and 5 o'clock in the morning only, when the trains are not running. To rebuild the upper part of the arch, a timber platform is constructed on which the men work, rather more than 14 feet in the clear above the level of the rails; and the beams composing this platform are, as will be seen by the accompanying sketch, supported upon rails such as are used on the line, bent to the form, and wedged against the sides of the tunnel. The workmen who erect this scaffolding are provided with a gauge 9 feet wide, with notches to rest on the rails, and of a section to suit the maximum loading allowed on the line, as well as with a rod 14 feet long, by which to test the height of the horizontal beams; and they are expected to allow about four inches in every direction in addition to the dimensions shown on the gauges thus provided.

On the 28th ultimo the 10 a.m. goods train left the

Adderley Park goods sidings, which are a mile and a half to the south of Birmingham, at 10.10, composed of an engine and tender, six waggons loaded with pig iron, one loaded with bran, one loaded with a disabled waggon, 18 empty waggons, and a goods break-van, wrong end first. It was delayed for about 10 minutes at the ticket platform near the entrance to the south tunnel, and it then proceeded through the New Street station to the north tunnel, entering that tunnel at 10.25, at a speed of about 18 miles an hour.

It had travelled less than 400 yards in the tunnel when the engine driver felt something jerking on his engine, and the breaksman was thrown off the seat of his van, which appeared to him to come suddenly to a dead stand. The driver stopped his engine, but before he could jump off to see what was the matter, a train ran past him in the opposite direction on the up line of rails, and came into collision with some of his waggons and other debris by which that line became obstructed. The breaksman, who had been hurt in the leg, was unable to leave his van for a short time, [in consequence of his tail-rope, spraggs, and other things having been thrown against the door; but as soon as he could get the door open, he applied his break (the handle of which was outside of the door) to prevent any of the vehicles from running back down the tunnel, and made the best of his way back to the New Street station, to warn the signalman of what had occurred.

The up train which thus came into collision with the disabled goods train left Dudley for Birmingham at 10.1 a.m., one minute late, consisting of an engine and tender, a third class break-carriage, a first, a second, and a third class carriage, a third class break carriage, in which rode the acting guard, and two other carriages without a break behind them. This train entered the north end of the tunnel at 10.28, at a speed of about 9 miles an hour. The tunnel was quite dark and full of steam and smoke after the passage of previous trains, and the engine driver felt his engine run suddenly against what he afterwards discovered to be some goods waggons and portions of fallen scaffolding. The engine mounted one of the waggons and part of the scaffolding, and stood with its leading end up in the air, partly on its side, leaning towards the intermediate space between the two lines of rails. The acting guard, who rode in the carriage last but three in this train, was thrown by the violence of the shock from his break compartment through the wooden partition into the third-class compartment in front of it, and he did not recover his consciousness for some minutes. None of the carriages left the rails, and they were all in a condition to travel forward after the accident, but unfortunately 21 of the passengers were injured, and three of them seriously.

There appears to be no doubt that this accident was caused by the truck before referred to as loaded upon another truck, having come in contact with the scaffolding in the tunnel. The rib with which it first came in contact was 1,138 feet from the mouth of the tunnel; and a second set of scaffolding was struck, as the train proceeded forward, 356 feet in advance of the first. The trucks and portions of both scaffoldings were thrown on the up line, and were struck by the engine of the passenger train 79 feet in advance of the second scaffolding.

The two trucks were high-sided coal trucks, numbered 304 and 703, and hired by Messrs. W. and T.

Phillips, coal merchants, of 25, Coal Exchange, London; the former, which was uppermost, from the Lancashire Waggon Company, and the other from the Metropolitan Railway Carriage and Waggon Company. They were so loaded on the 24th June, four days before the accident, at the Willesden Junction, near London. They were taken thence to Rugby, and from Rugby to the Adderley Park sidings, from which they started on the morning of the 28th June, as already explained. But there is no gauge, either at Willesden or at Adderley Park, to enable the waggon examiners to ascertain whether or when the dimensions laid down in the Clearing House Regulations for the maximum load of carriages and waggons are exceeded.

Two waggons of similar construction were loaded together in a similar manner, at my request, at the Willesden junction on the 22nd instant, the near wheels of the upper waggon lying inside the body of the lower waggon, and the off axle-boxes of the former resting on the side of the latter. I found that the height on the low or near side of the upper waggon was 11 feet at one end, and 11 feet 1 inch at the other, and that the side of the upper waggon extended 23 inches beyond the outer edge of the rail. The maximum load laid down for this part of the London and North-Western Railway is 9 feet wide, by 13 feet 3 inches in the centre, and 10 feet 7 inches at the side. And it will thus be seen that the loading of these waggons was five or six inches higher at the low or near side than it ought to have been. The chief blame in such a case would rest ordinarily with the goods foreman or waggon examiner under whose orders the waggon was loaded and despatched, because it is assumed at succeeding stations that a waggon has been sent away from its starting-place in a proper condition, and that if the load has not shifted on the journey the loading dimensions have not been exceeded. But I cannot blame the foreman at Willesden, so long as he is unprovided with the means of ascertaining whether the loading is correct. I conceive that it is rather my duty to recommend that gauges be at once supplied at that goods station and junction, as well as at the Adderley Park sidings, and at all other stations, junctions, and sidings at which goods trucks are loaded or from which goods trains are despatched. It would be useful also to place a gauge over the middle down line at the New Street station, Birmingham, along which the train in question passed on the 28th ultimo, under the foot bridge across that station, to correspond with that which already exists over one of the side lines, with a bell attached to it, to ring when the gauge is struck at any time by a passing load.

I may add, in conclusion, that if the accompanying section could be taken as a guide to the dimensions of the tunnel and scaffolding, there would still have been five or six inches to spare between the near edge of the waggon and the rib wedged against the sides of the tunnel, and I can only conclude therefore that some irregularity in the shape of the arch or the fixing of the rib must have combined with oscillation in the waggons to cause them to come together as they appear to have done in producing this accident.

I have, &c.,

*The Secretary
Board of Trade,
Whitehall.*

H. W. TYLER,
Capt. R.E.

LONDON AND NORTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 24th August 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the directors of the London and North-Western Railway Company [Lancashire and Yorkshire Railway Company], the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred, on the 22nd ultimo near the Salford Junction on the London and North-Western Railway.

I am, &c.
W. D. FANE.

*The Secretary of the
London and North-Western
Railway Company.*

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

SIR,

Whitehall, 16th August 1865.

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 25th ultimo, the result of my inquiry into the circumstances which attended a double collision that occurred on the 22nd ultimo between a passenger train belonging to the London and North-Western Railway Company and an empty engine and a passenger train belonging to the Lancashire and Yorkshire Railway Company, on the London and North-Western Railway, nearly midway between Salford Junction and Victoria Station, Manchester, when 15 passengers in the Lancashire and Yorkshire train received injuries which are represented to be not severe, and no persons in the London and North-Western train were hurt.

The Salford Junction is not quite three-quarters of a mile distant from the Victoria Station, and up to the end of last month the traffic belonging to both companies, to the west and north-west, from Manchester, was worked over this portion of line, which, in consequence of the crowded state and insufficient amount of siding accommodation for the Victoria Station, is also greatly occupied by the formation and shunting of trains and the running to and fro of empty engines. It is entirely on a viaduct and is curved, so that the view is obstructed and limited by houses and buildings.

The Salford Junction, belonging to the London and North-Western Railway Company, is protected by junction and distant signals in each direction, and a London and North-Western signalman is placed over New Bailey Street about 200 yards on the Manchester side of the junction, to caution trains by means of flags, red and green by day, and lamps, red and white by night, as they arrive or depart, when other trains are immediately in front of them. His view, however, towards Manchester is limited to about 200 yards.

The approach to the Victoria Station from the west is protected by station, distant, and an intermediate signal intended to act as a repeating signal for the distant signal, which cannot be seen from the lever handles placed at the west end of the bridge over the River Irwell. Special regulations with reference to these signals were issued no later than the 3rd June last, as an alteration in the position of the signals was then about to be made, in consequence of the near completion of the Lancashire and Yorkshire Company's new line of railway between Salford and Victoria Station, which runs alongside of the London and North-Western line nearly throughout the whole distance.

It appears that on the 22nd ultimo, the Lancashire and Yorkshire north train, appointed to leave Fleet-

wood for Manchester at 2.55 p.m. and which consisted of engine and tender and 15 vehicles, including 2 break vans, with a guard in each van and with continuous breaks on 3 vehicles at the two extremities of the train, passed the Salford Junction, and came to a standstill, with the last vehicle 470 yards east of the junction about 5.20 p.m., in consequence of the station, repeating, and distant signals being all on at "danger." It was followed without delay by a Lancashire and Yorkshire empty engine proceeding from Salford to Victoria Station for the purpose of taking out a train from that station, the signalman, Eccles, at the New Bailey Street box, having cautioned the drivers of both engines by green flags and by telling them that there were trains ahead. Both are said to have been proceeding quite slowly, or at four miles an hour according to signalman Eccles, and both passed out of his sight. Shortly after, for the actual interval of time is uncertain, the London and North-Western 4.20 p.m. train from Liverpool to Leeds passed the Salford Junction, the signals being lowered for it to pass, without any hand caution signal being shown by the junction signalman to the driver of the train, which seems to be the practice when trains follow each other closely past this junction. The signalman, Eccles, states that it passed his box two or three minutes after the empty engine, and that he showed the driver of the London and North-Western train a red flag when the driver was about 35 yards west of his box; that the driver was doing something on the near side of his engine, and he does not know whether he saw him or not; that there was a Lancashire and Yorkshire down train coming from Manchester at the time, and it passed between him and the London and North-Western train. He says that the London and North-Western train was travelling faster than the other trains, or about eight miles an hour, and, in consequence, he showed the driver the red flag, otherwise he would have cautioned him with the green flag, similarly to the Lancashire and Yorkshire train and empty engine. The London and North-Western train did not pass quite out of his sight before it had run into the empty engine, and pushed it forward till that engine had come into collision with the Lancashire and Yorkshire train. The driver of the London and North-Western train, which consisted of engine and tender and 11 vehicles, with one guard for the whole train, with a single and not a continuous break to it, states that he saw the signalman, Eccles, at his post, and that he had a green flag in his hand, but that he gave him no signal whatever; that he did not exceed seven miles an hour at any time from the taking over the train at Ordsall Lane to the time at which the collision took place; and that he was not running more than three or four miles an hour when he struck the empty engine. He complained that neither the guard of the train nor the fireman of the empty engine had gone back to protect the tail of their trains, and he adds that as soon as he saw the empty engine in front, he did his best to stop by reversing the engine, putting on the tender break, and whistling for the guard's break.

The empty engine could have been seen by the driver of the London and North-Western train for a distance of 110 yards, and if he had only been running six or seven miles an hour, as he stated, and had been keeping a very good look out, there would have been space enough to have allowed the train to be stopped before the collision with the engine took place, if the London and North-Western train had been supplied with a fair proportion of break power. The contrast between the proceedings of the two companies in this respect is very great; one supplies 6 vehicles out of 15 with breaks, while the other allows 1 out of 11 only to have them. The guard of the Lancashire and York-

shire train states that the London and North-Western train came round the curve at a speed of from 15 to 20 miles an hour. I think it likely that this is somewhat in excess of the real rate, as the driver's estimate is actually below it. The guard of the Lancashire and Yorkshire train says he went back to protect the tail of his train after it stopped, and cautioned the driver of the empty engine, which, according to one statement, drew up within 3 yards of the Lancashire and Yorkshire train, and according to another at 15 yards from it. The collision took place about 5.29 or 5.30 p.m. The buffer plank of the London and North-Western engine was broken, and the buffers knocked off. No vehicle was thrown off the rails, and not much other damage to any other of the vehicles was done. But the inquiry into the circumstances which attended this collision has elicited facts that are not creditable to those engaged in the management of the London and North-Western line and traffic at the Victoria Station, Manchester, although it must be admitted that they have had great difficulties to contend with in an enormous amount of traffic, an insufficient amount of siding accommodation, and a very indifferent station, which obliges the up and down through traffic to be worked on a single line and from a single platform for both Railway Companies.

Thus, the Company's printed regulations issued for the guidance of the Company's servants, direct every person entrusted with signals to stop all trains or engines that follow others when an interval of 5 minutes of time has not elapsed. There are no special regulations, I was informed, for this line between Salford Junction and Victoria Station, and yet I ascertained that engines and trains were permitted to follow each other past the junction, in defiance of the printed regulations, without any interval of time between following trains being preserved.

Now, it is not unlikely that if a fatal result should attend any collision on the line between Salford Junction and Victoria Station, some servant of the Company would be liable to be tried on a charge of manslaughter for the non-observance of this rule.

Again, another rule, which directs the guard of a passenger train or the fireman of an empty engine to go back 1,000 yards, in the event of the train or engine being stopped or disabled from proceeding from any cause, is certainly not observed in this locality.

A third rule directs an engine-man to bring his engine or train to a stand at the auxiliary signal post, then to open his whistle and proceed with caution

towards the station. Now, I may safely state that this is never attended to between Salford Junction and Victoria Station.

It is unnecessary to discuss whether these rules are proper ones to be upheld for this locality or not, but if the officers of the London and North-Western Railway Company think they are suitable, proper means should be adopted for their being maintained; and if, on the other hand, they deem them to be unsuitable, special regulations should be issued setting aside the general ones.

Again, I have already stated that the distant signal worked from the Victoria Station had been erected since the 3rd June, the exact date is uncertain; but it will scarcely be credited that up to the time of my making the inquiry it had never been used as a signal should be used, as it had stood at danger at all times, and the drivers of trains entirely disregarded it. The signalman at Victoria Station reported on the 25th ult. that it could not be worked, and on the 27th I ascertained that it was still in the same state, and that the intermediate signal, which was intended to serve as a repeating signal for the distant signal, was, from its peculiarity of construction, quite useless for that purpose.

As the new line between Salford and Victoria Station belonging to the Lancashire and Yorkshire Railway Company is now opened for traffic, the London and North-Western line will be greatly relieved by the absence of the Lancashire and Yorkshire trains and empty engines. But the London and North-Western one-sided station at Victoria is very objectionable and dangerous, so that collisions frequently take place which are not reported to the Board of Trade.

In my opinion it is greatly to be regretted, as far as the safety of the public is concerned, that arrangements were not recently made for a joint station for the two Railway Companies at the Victoria Station. As it now is, there are two separate stations, and both of them are bad and inconvenient.

The chances of preventing collisions near the locality where this one occurred would be increased if the signalman Eccles, were shifted to the middle of the curve nearly opposite to the old mill that obstructs the view, but he should be furnished with semaphore signals.

LONDON AND NORTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 11th September 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred, on the night of the 7th ultimo, at the Dudley Station of the London and North-western Railway.

I am, &c.

*The Secretary of the
London and North-western
Railway Company.*

SIR, *Birmingham, 8th September 1865.*

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 29th ultimo, the result of my inquiry into the circumstances which attended a collision that occurred on the 7th August, at the Dudley Station of the London and North-

western Railway, between the engine of a goods train and a passenger train about to leave the station for Dudley Port, when about 17 persons were slightly injured.

It appears that on the night of the 7th ultimo, a goods train arrived at Dudley from Wichenor, about 9.25, and after the driver had shunted the in and out goods trains from the sidings, he took the engine on to the turn-table at the southern end of the station for the purpose of turning it prior to taking out a goods train for Wichenor, due to leave Dudley at 10.5. After he had turned the engine he brought her to a standstill below the points leading from the turn-table, and then got off and left the engine, having, as he says, told the fireman before he left not to move the engine; but this is distinctly denied by the fireman. One of the company's regulations prohibits a fireman from moving an engine if the driver be not present, but on this occasion it is certain that the fireman moved the engine from the points before referred to out on to the main line, and then reversed the engine, and moved the engine in an opposite direction, by the passenger departure line of rails to the other end of the station yard so as to

get, by shunting, in front of the leading end of the goods train which was appointed to be taken from Dudley for Wichenor at 10.5 p.m., without having previously looked over the side of the engine to ascertain if the departure line was clear for him to proceed.

He states that he sounded the whistle three times for the signal which applies to a goods train to be taken off, and he thus virtually admits that it was at danger; but the fact was that he could not have looked ahead at all at the signals, otherwise he must have seen two red lights on the last carriage of the 10.15 p.m. local train between Dudley and Dudley Port, which was then standing at the side of the down platform and on the identical road which the goods engine had to travel in order to get to the west end of the station yard. The distance between the points where the goods engine came out on to the main line, and the spot where the last carriage of the local train stood is about 115 yards. It is on a gradient on which carriages will not stand at rest, unless a break be applied, and the fireman admits that he turned on the steam to go ahead and did not

see anything of the train in front. A slight collision occurred, so that the tail lamps on the last carriage of the local train of four carriages were broken. The local train was in the act of starting or the collision might have been more severe.

The fireman states that he had frequently done the same thing before. He is said to be a man of good character, and it is evident that the collision was entirely due to his carelessness in not having looked over the side of the engine to see if the line was clear before he moved the engine, and his infraction of the company's rule in moving the engine when the driver was absent.

I am unable to state whether the driver or fireman is correct as to the driver having forbidden the fireman to move the engine until he returned to it.

The fireman has been dismissed the company's service.

*Board of Trade
(Railway Department),
Whitehall, 22 Sept. 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-western Railway Company, the enclosed copy of the Report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the Victoria Station, Manchester, on the 14th ultimo.

I am, &c.

*The Secretary of the
London and North-western
Railway Company,
Euston Square.*

W. D. FANE.

*Sandown, Isle of Wight,
14th September 1865.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 29th ulto. the result of my inquiry into the circumstances which attended a collision that occurred on the 14th ultimo, at the Victoria Station, Manchester, of the London and North-western Railway, between a passenger train entering the station and the engine of an empty train then standing in one of the sidings preparatory to leaving for Patricroft, when 15 of the passengers were slightly injured.

It appears that on the morning in question, when the 8 a.m. down train from Manchester to Wigan was leaving the Victoria Station, one of the carriage cleaners jumped on the step of the guard's break van, and told the guard that his break was of no use, as it was in some way broken; and when the train reached Ordsall Lane the guard says he got out of the van and went to the driver of the train and told him that his break was of no use, so that he would have to do all the stopping of the train himself, and the driver is stated to have replied that he would run steadily up to all the stations. On the arrival of the train at Wigan, the engine was detached, but it is not certain whether it was detached before the train actually stopped or after it came to a stand still, and as Wigan Station is on an incline on which carriages will not stand unless a break is put on, no sooner had the train stopped and the few passengers who were in the train had got out on to the down platform, than the train began to run backwards; and it had run something like 100 yards when a pointsman laid hold of

the points leading into the goods siding and turned the empty train into the goods siding, where it came into contact with a goods waggon, but did no damage as the pointsman eased off the break on the waggon before it was struck. The driver was then obliged to go down into the siding to bring the train out of it, and according to the guard, he got on to the engine and asked the driver how it was that he unhooked at Wigan after he had told him that his break was of no use, and he says that he told the driver not to unhook from the train until they had got it made secure. The train was then taken out of the goods siding up to the down platform, where some of the wheels were scotched and the engine then ran round the train and took it across to the up road and up platform; the parcels, luggage, and passengers were taken in, and the train started for Manchester on the return journey at 9 a.m. The train consisted of a tank engine, 4 carriages, and the guard's break van, the break van being placed with one carriage between it and the engine. This train stopped at all stations up to Worsley on this return journey, and from thence it ran to Ordsall Lane, 1 mile from Victoria Station, where the guard states that the driver called to him to ask if anything had been broken in the goods siding when the train ran back into it, and the guard says he answered in the negative, and that he again complained to the driver of his having unhooked at Wigan after he had told him that his break was of no use. He says the driver asked him if he should report it, and was answered in the affirmative.

The engine took water at Ordsall Lane and the tickets were collected, and the guard states that while he was talking to the driver, he was called away by one of the passengers, and the driver got on to the engine, and the train shortly afterwards was started for Manchester. He also states that the train travelled at unjustifiable speed between Salford Junction and Victoria, and that as he approached the facing points by which all trains are turned from the main up line on to the down main line (or wrong road) and from thence by another pair of facing points where all carriages are turned into the sidings and docks, to and from which local trains arrive and depart, he began to fear that the driver would uncouple the engine while it was running at a rate of 15 miles, and in consequence he got out on to the step of the van and both whistled and called out to the driver in order to attract his attention but did not succeed in doing so, and then he called out and signalled to the pointsman to allow the carriages to follow the engine into the station. The first pointsman allowed the

train to follow the engine, from which by this time it had been uncoupled, a short distance on the main down road, but the second pointsman turned the carriages into No. 2 siding line, while the engine continued to run along the main down road towards the through train one sided passenger platform. The guard states that after seeing the train divided from the engine, having no power to stop it with his break he jumped out on the right hand side as the carriages were running up to the siding platform, and called out to passengers to sit fast and hold on firmly, and the collision with the engine of the Patricroft train then took place at a speed which he estimates at 15 miles an hour but which estimate is probably in excess of the true rate. This Patricroft train had been placed alongside of the siding platform to be ready to leave at the appointed time.

This guard's statement is partially supported by the fireman, but the officers of the company do not place reliance on the confirmation, as they consider that it differed from the statements which were made when an inquiry was first instituted immediately after the collision took place.

Both the driver and guard have been dismissed. I did not see the driver, and although it is by no means easy to apportion the exact amount of blame that should rest on these men, it is quite certain that after what occurred at Wigan at the end of the down journey, the driver was very much to blame for having unhooked the engine as he was descending the incline of 1 in 164 towards Victoria Station. The officers of the company think it was a part of the guard's duty to ascertain that his break was in proper order before he stated the train in the morning, but there is no rule to that effect in the company's regulations, and it is certain that guards do not always make a point of ascertaining this fact before their trains start.

The break was examined on the previous night (Sunday) and found in good working order, and the porter who acted as shunter in the Victoria Station yard on the Monday morning states that he got into the van as the train was descending the incline, by the action of gravity, towards the platform siding and he tried to stop the carriages, but found he could not do so, as the break was useless, and they were only brought up by the buffers at the end of the siding. A carriage washer then offered to go and look for the carriage examiner, and did go, but was unable to find him, and when the train left, he

cautioned the guard, as I have already stated, that his break was out of order, and that he had better not have the engine taken from the train when running into Victoria Station. He did not tell any inspector and the station master was not present.

Although fortunately no very serious injuries were received by passengers in this collision, the circumstances elicited, have disclosed mismanagement independent of that of the driver and guard of the train.

Thus, a porter, acting as shunter, finds the break of a guard's van useless when a train is being taken to the platform, in order that it may start without much delay. He calls out for the carriage examiner, and being unable to make him hear, and having other duties to perform he gets a carriage washer to seek for the carriage examiner, but the latter cannot be found.

No proper supervision appears therefore to be exercised at the Victoria Station, as this train was permitted to start in a worse condition than if it had been sent without any guard's van at all, as there was so much additional weight to control in descending the inclines or in stopping at the stations. The station master or the platform inspector should be on the platform to see all trains start, and he should have been made acquainted with the fact that the break in the van was useless.

Allowing a train to leave in this state was the more reprehensible, as it was perfectly well known, that the objectionable and dangerous practice of fly shunting or the unhooking of the engine from the carriages while in motion, and then turning the engine by a pair of facing points in one direction while the carriages were subsequently turned into a different line, had long been followed at the Victoria Station for all local trains from the west.

I understand the practice of fly-shunting is now to be given up, and I wish I could add that the Directors of the London and North-western Railway Company had determined to remodel their Victoria Station.

They are making great improvements at many of their stations, but I am not aware of any one that so much requires alteration in order to provide for the safe working of trains as this Victoria Station.

SIR, *Whitehall, 20th September, 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you to be laid before the Directors of the London and North-western Railway Company, the enclosed copy of the Report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred near the Waverton station on the 30th ultimo.

I am, &c.,

*The Secretary of the
London and North-western
Railway Company,
Euston Square.*

W. D. FANE.

Sandown, Isle of Wight,

SIR, *15th September 1865.*

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 7th instant, the result of my inquiry into the circumstances which attended the collision that occurred at Waverton coal

siding, about $3\frac{1}{2}$ miles from Chester, on the London and North-western line, between Chester and Crewe, on the 30th ultimo, between an Excursion train and the engine of a Salt train, when about 20 passengers received injuries, but it is hoped that none of them may prove serious.

The 12 h. 30 m. P.M. Salt train from Crewe to Chester arrived at Waverton coal sidings, which are situated about 600 yards on the Chester side of Waverton station about 1 h. 35 m. P.M. It was stopped by the down distant signal, worked from the sidings towards Waverton station, being on "at danger" against it. The train was brought to a stand on the down line, and the engine was then detached from it, and went across to the up line, and was then shunted into the coal sidings for the purpose of taking out some empty coal waggons. The engine was engaged for some minutes in marshalling waggons in the coal sidings and then got out on to the up main line with three waggons attached, when an Excursion train was seen to be rapidly approaching from Chester. The driver of the Salt train was engaged in pushing these waggons back into the siding, and had got the waggons clear of the up line, when the engine of the

Excursion train came up and struck the engine of the Salt train and glanced off from it, getting off the line, and then running into the salt waggons which had remained standing on the down line, and knocking several of them off the road. The Salt train engine was also thrown off the line, as well as two of the carriages of the Excursion train. A good deal of damage was done to the engines, carriages, and waggons. The speed at which the excursion train was travelling at the time when the collision took place is variously estimated by the different witnesses at from 5 or 6 to 15 or 16 miles an hour, and judging from the amount of damage done, I should think it did not fall far short of the higher rate named above.

Waverton coal siding is protected on the Chester siding by a distant signal only, placed 640 yards from the lever handles near the points leading into the sidings. There are no station signals. The distant signal is a low signal, and to a train coming from Chester it is backed by trees, so that although the view is not intercepted by any intervening object for a distance of 400 yards, and at intervals only up to 550 yards, in a bright sunny day it is very badly seen, and it is even difficult to keep it in sight when walking steadily back from it.

The train which ran into the salt train was the North Staffordshire excursion train which should have left Chester at 1 h. 10 m. p.m., but in consequence of detentions by signals at Mostyn and Mold Junction, it did not leave Chester till 1 h. 35 m. p.m., or 25 minutes late. It consisted of engine and tender and 31 vehicles, including 3 break vans with 3 guards, and the driver states that he did not see the Waverton coal siding up distant signal until he got close to it, and then he mistook it for a caution signal, but from nearly the whole of the evidence it is quite certain that it was on at danger, and had been placed at danger as soon as the salt train stopped there.

The driver further states that he shut off the steam a few yards after passing the distant signal, but did not cause the tender break to be put on, or whistle for the guard's breaks, until he could see what was on the road in front, and ascertain whether the other engine was in the siding or on the up road; and after coming round the curve and getting about half way between the distant signal and the siding he then had the tender break put on, whistled for the guard's breaks, reversed the engine, and put the steam on the reverse way, and, in fact, did all he could to stop. Two of the guards of the excursion train state that they saw the distant signal at danger before they reached it, one at 100 yards from it, and the other at

200 yards, and both say that they proceeded at once to put on their breaks without waiting for the signal whistle from the driver calling upon them to do so. None of the servants of the company with the excursion train place the speed of the train at a higher rate than 30 miles an hour, and most of them name 20 miles an hour as the probable speed; but as the head guard states that the train left Chester at 1 h. 35 m., and that he looked at his watch immediately after the collision took place, as he was going back, and found that it was then 1 h. 44 m., I am of opinion that they must have been travelling at a higher rate than 30 miles an hour.

There can be no doubt that the driver was greatly to blame for not having immediately taken the necessary steps for arresting the progress of his train as soon as he was made aware by the fireman that the distant signal was at danger, admitting that he mistook it for a caution signal when he first saw it. He has been dismissed the company's service.

It is supposed that there were between 6 and 700 passengers in this excursion train, and the engine was driven by a man who had only been nine months a driver. These unwieldy excursion trains are very unmanageable, and if they are run at all, they should be confided to the most experienced drivers in the company's service, and be furnished with a very much larger proportion of break power than in this instance. I believe the London and North-Western Railway authorities are at last convinced, that it is perfectly practicable to employ a much greater proportion of break power by using continuous breaks, without any material additional expense, but they have been an uncommon long time in arriving at this conclusion, and are now, I am glad to say, about to act on it.

The up distant signal should be placed at a greater distance from the coal siding, and as it could not then be seen from the siding, the present signal, if raised, would still serve as a repeating signal, if properly connected with the new distant signal, which should be a much higher one than the present one.

Up and down station signals are also required at the coal siding, because the company's rules are not upheld, which direct all drivers to stop at the distant signals when at danger, and then proceed cautiously;—instead of doing so, they almost invariably try to whistle them off, and run past them, and that is one of the principal causes why there are so many collisions.

I have, &c.

W. YOLLAND,
Col.

*The Secretary
Board of Trade,
Whitehall.*

LONDON AND NORTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 27th September, 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, to be laid before the Directors of the London and North-Western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the Wolverhampton station on the 2nd inst.

My Lords trust that the Directors will give the report their most careful consideration.

I am, &c.

W. D. FANE.

*The Secretary of the
London and North-Western
Railway Company.*

Sandown, Isle of Wight,

19th September, 1865.

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 6th instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 2nd instant at the ticket platform of the Wolverhampton station of the London and North-Western Railway, between two passenger trains, when 39 passengers were injured, and it is feared that 5 of this number are rather seriously hurt.

The Wolverhampton station on the Western side is protected by a station signal a short distance west of the station, and by an up distant signal at the Cannock Road, 646 yards from the station signal from which it is worked. There was formerly a junction with the Great Western Railway at this

point, and this distant signal then formed one of the junction signals, and there would then be an up-distant signal worked from this junction towards Bushbury Junction, which is distant about a mile from Wolverhampton station, but the junction with the Great Western Railway has been taken out, and the up-distant signal worked from that junction been done away with. There is, however, an intermediate signal between Wolverhampton station signal, and the up-distant signal at the Cannock Road, which is 308 yards from the station signal. The distant and intermediate signals are worked by the same wire, and the ticket platform is situated between the station and intermediate signals.

On the night of the 2nd instant, the 6h. 30m. p.m. up Liverpool passenger train, consisting of 8 vehicles and a horse box at the tail of the train, stopped at the Wolverhampton ticket platform at 10h. 10m. p.m., the horse box standing 176 yards inside the intermediate, and 514 yards inside the up distant signal at the Cannock Road.

The line from Bushbury Junction to Wolverhampton station is on a rising incline of 1 in 100 for nearly the whole distance, and the station, intermediate, and distant signals can be seen on a clear night for the greater part of the whole way.

The 8h. 50m. p.m. passenger train from Walsall to Wolverhampton, via Bescot and Bushbury Junction, which consisted of a tank engine and four carriages, with continuous breaks on the two last carriages, left Bushbury Junction for Wolverhampton shortly after 10h. 10m., or 30 minutes late.

The driver of the train admits that the up distant signal at the Cannock Road was at "danger" as he approached it, and he states that he shut off the steam before he reached it, and opened the steam whistle as he came to it, for the purpose of whistling it off, and finding that the speed which he estimated he was running at (20 miles an hour), did not diminish as rapidly as he expected, he turned round to see if the fireman was putting on the break, and found he was turning the handle the wrong way. He says he told him to hold on but did not tell him that he was putting the break on the wrong way, and that he did not know what to do, whether to go to the break himself or to reverse the engine, but that he reversed the engine, having failed in the first instance to do so, and succeeded in the second attempt; he then turned on the steam the reverse way, and whistled for the guard's break, when he was about the intermediate signal, which, as before stated is only 176 yards from the spot at which the collision with the horse box at the tail of the Liverpool train immediately afterwards took place, at 10h. 17m. p.m., as the train was about to start.

The effect of the collision was to crush the horse box which was loaded with fish, and to break in the end of the van next to it. The leading wheels of the engine mounted but did not get off the rails. Nearly the whole of the passengers who received injuries were seated in the Liverpool train, and it is fortunate that there was a horse box at the rear of the train or the consequences might have been much more serious. It is probable that the passengers in the Walsall train escaped being injured in consequence of there being continuous breaks applied on the two last carriages which would in a great measure prevent them from recoiling. The driver of the train estimates the speed of the train at the time of the collision at 6 or 7 or perhaps more miles an hour, while the guard of the train names 10 or 12 miles an hour, and I think this rate more likely to be correct than the other.

The guard of the train saw the up signal at the Cannock Road on at danger just before they got to it, and he says he put his break slightly on and then looked out and saw that the intermediate signal was also at "danger," and then he put his break rather tighter on, and he looked again as he passed the intermediate signal, and thought the signalman must have

been calling them on. He then saw the tail lights on the Liverpool train and heard three sharp whistles for the breaks, and then he put his break hard on. He estimates the speed at which the train came up the incline at 40 miles an hour.

Now it must be recollected that this train should have been brought to a standstill at the ticket platform where the other train was then standing, and the collision affords a good illustration of the system under which traffic is worked past distant signals on at "danger" on the London and North-Western Railway. The company's regulations direct that all trains shall be brought to a stand at a distant signal when it is on at danger, and then draw cautiously forward if there is no obstruction in the way; but the officers do not uphold the rule and the practice is to endeavour to whistle them off and to run past them, and endeavour afterwards to pull up if anything is on the line. The regulation is a good one, and the practice followed most objectionable and dangerous.

As to the causes which produced this collision I consider that no dependence whatever can be placed on the driver's statement that the fireman put on the engine break by turning the handle the wrong way. It is directly contradicted by the fireman himself and by the examination which was made about 20 minutes after the collision took place by the locomotive foreman stationed at Bushbury Junction. It seems that the driver made a complaint of the fireman, who was a stranger to him, to the foreman, that he had turned on the break the wrong way, and the driver was then asked by the foreman whether any one had moved the break since the occurrence took place, and was answered in the negative. The foreman then examined the break and found it hard on.

Another fireman rode up on the engine from Bushbury Junction to Wolverhampton, and he distinctly contradicts several of the statements made by the driver which bore on the same fact, and I am thus obliged to discredit the statement, and I can only conclude that he was driving recklessly up the incline, and failed to pay proper attention to the signals, so as to have his train under control in order to stop at the ticket platform.

In the course of the investigation it appeared that on the previous day, this driver came on duty at 6 p.m., went to Walsall, and got back to Wolverhampton at 9h. 30m. p.m. He then went to Bushbury Junction and remained shunting trains there until noon of the next day. He then went home and went to bed about one o'clock, or half past one o'clock, and got up again at half past three o'clock. He then relieved the man who was piloting at Wolverhampton at five o'clock, and went to assist the up Scotch express from Bushbury to Wolverhampton at 6h. 40m. and reached Wolverhampton at 6h. 50m. p.m. After shunting two or three trains he went to Walsall at 7h. 30m. p.m., and got there at 8h. 15m. Left Walsall at 9h. 20m. and it was on the return journey that this collision took place.

I am not prepared to say that the collision in this instance was occasioned by the long hours the driver had been working and the short interval of rest which he had had; but it is manifest the public safety would be seriously endangered if such long hours of labour be permitted, and I think the attention of the directors of the London and North-Western Railway Company should be called to the subject, as well as to the practice which has got into use with respect to passing distant signals at danger without stopping.

I am glad to learn that the telegraphic system of working traffic on the London and North-Western Railway which now extends as far as Wolverhampton from the south is to be extended beyond it and on towards Stafford.

I have, &c.,
The Secretary W. YOLLAND, Col.
Board of Trade,
Whitehall.

LONDON AND NORTH-WESTERN RAILWAY.

Board of Trade
(*Railway Department*),
Whitehall, 8th January 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of the Directors of the London and North-Western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the two collisions that occurred near the Sudbury station on the 4th ultimo.

I am, &c.

The Secretary of the W. D. FANE.
London and North-Western
Railway Company.

Gloucester,

SIR, 4th January 1866.

I HAVE the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your Minute of the 11th ultimo, the result of my inquiry into the circumstances which attended two consecutive collisions that occurred on the 4th December, a short distance south of Sudbury station, on the London and North-Western railway, when about nine passengers received slight injuries, and the two guards of the passenger train and a fireman of one of the coal trains were also hurt, the latter somewhat seriously.

At this part of the London and North-Western railway there are one down main line, used for all kinds of traffic, and two up lines, one of which, the up main line, is devoted to the passenger traffic, and the other to the mineral and goods traffic and an occasional passenger train. The up and down main lines are worked with the assistance of the electric telegraph, 42 telegraph stations having been established between London and Rugby (82½ miles), placed on an average nearly two miles apart. The second up line is worked in the ordinary manner without the assistance of the telegraph. Each telegraph station is supplied with a station and two distant signals, one in each direction, and the company's regulations for the main lines direct that "danger signals are to be shown until the line is telegraphed clear, and any engine or train arriving within this period is to be stopped, and the driver and guard told by the policeman on duty that the line is blocked according to the indication of the needle."—Rule No. 44, page 22.

Again, the instructions to engine drivers and guards, state, No. 18, page 26: "On approaching a telegraph signal station, should the signal be at danger, you are to bring your engine to a stand at the signal, and wait verbal instructions from the policeman in charge."

Unfortunately, as I shall have occasion to show, these instructions are practically set aside, and seldom, if ever, obeyed.

On the afternoon of the 4th ulto., a ballast train travelling on the second up or goods line, left Harrow, proceeding towards London, for the purpose of dropping ballast at one or two places on the line near Wembley and the bridge over the Brent River, about 3h. 4m. p.m., and after some ballast had been dropped near Wembley the train proceeded to the bridge over the Brent, a ballast signalman remaining on the line, near the up distant signal, which is about 660 yards north of the Brent telegraph station, and in due course this signalman exhibited his signals, and caused the 10h. 5m. a.m. up coal train to pull up and slacken speed, and then it passed slowly on until it had drawn close up to the rear of the ballast train, and then stopped with the van at the tail of the train, about

220 yards south of the Brent telegraph station. The ballast signalman, as the coal train passed, left his post near the up distant signal, and got on to the step of the break van of the coal train, on his way to join his own train, but he left no signal of any kind on the railway to serve as a protection to the rear of the second coal train, and the breaksman of that train rode in the van till the train stopped, and then he proceeded to put on his side lamps and went back, after some minutes delay, with his signals, in order to protect the tail of his train.

Apparently the ballast signalman thought he was doing what he considered right in proceeding to rejoin his own train, but the effect of his act, coupled with the gross neglect of the breaksman of the coal train in not getting down from his van with his signals when the speed of the train was reduced to six miles an hour, or at all events not going back as soon as his train stopped, was to leave the second coal train entirely unprotected from a following train, except by the tail lights exhibited on the break van.

The line at this part is on a curve and in a cutting, so that these tail lights could not be seen at a greater distance than about 320 yards by the driver of a train on the up goods line. In about 6 or 7 minutes after the coal train had stopped, the 10h. 55m. a.m. up coal train came up and ran into the van at the rear of the first coal train, when the engine was thrown off the rails to the left, and fell over on to its left side; the tender was separated from the engine and canted round; the fireman was embedded in coals on the foot-plate of the engine, and was seriously scalded and hurt. The van and two coal trucks of the first coal train were smashed to pieces, and a furniture van belonging to the second coal train, which stood next to the tender, and a coal truck were thrown off the rails to the right, and blocked the up main passenger line.

The breaksman of the first coal train had got back to just opposite the Barnet telegraph station, and the policeman on duty there, when he saw the second coal train advancing from the north, showed a red flag towards the train, which, if the driver had been looking in the direction of his post, could have been seen at a distance of 500 or 600 yards, or upwards of 700 yards from the rear of the break van of the first coal train; but it does not appear to have been seen until the train was close upon an over accommodation bridge about 100 yards north of the Brent signal station; and although the driver states that he did all in his power to stop after he saw the signal, the second coal train ran into the first coal train at a speed which the driver estimates at 14 miles an hour, with the results which I have already stated. This occurred about 3h. 50m. p.m.

The policeman on duty at the Brent telegraph station, on seeing the up main line apparently fouled in consequence of the collision between the two coal trains, very properly, and also, it seems, very promptly, put on all his signals to "Danger," as he had previously given "Line clear" for the 12h. 20m. p.m. up express passenger train from Birmingham, and had been informed by telegraph that this train was "on the line," having passed the next telegraph station at Wembley cutting, north of the Brent telegraph station. It is admitted by the driver of this up express train that the up distant signal was at "Danger" before his train reached it, that the station signal was also at "Danger;" he says he was then travelling at from 39 to 40 miles an hour; the head guard thinks it might be 45 miles an hour, and there is every reason for thinking that this statement does not exaggerate the speed at which the train was travelling. The driver of the train states that "As

"soon as he saw the signal, he shut off the steam told the fireman to put on the tender break, and whistled for the guard's break, and when they got near to the over bridge he saw the signalman and two or three other persons coming towards him and holding up their hands to stop his train, and then he reversed his engine and put the steam on the reverse way; he thinks the speed had been reduced to 20 miles an hour when the collision with the coal truck and furniture van which had fouled the up main line took place," the fireman says "30 miles an hour," the head guard "27 or 28," and the second guard "from 20 to 25 miles an hour." This collision took place about two minutes after the first.

The express passenger train consisted of engine and tender, 14 carriages, and 2 break vans with 2 guards. The average speed of this train is rather more than 40 miles an hour after deducting for stoppages, and it is admitted that it frequently, like other express trains, travels 60 miles an hour over portions of the line. The engine was thrown off the line all six wheels, but stood close to the rails, while the tender was not off the line at all, neither were any of the carriages. The furniture van and the coal truck were destroyed, but altogether the results were much less serious, especially as regards the injuries to passengers, than might have been anticipated from a collision taking place at such speed. This was probably due to the weight of the passenger train and to its having only ran into a couple of vehicles.

The head guard, riding in the van at the tail of the train, states, that the whistle was not sounded for the breaks, but apparently to get the signal taken off, but on the other hand, he says that he applied his break although it was not whistled for. The fireman and under guard both state that they applied their breaks at the time when the whistle was sounded, and from what I have already stated, it appears that this second collision occurred between a train travelling at least 20 miles an hour and an obstruction on the line just half a mile after the express had passed a distant signal placed, and seen by the servants of the company in charge of the train to be, at "Danger" before the train passed it.

I am unable to blame the servants of the railway company for having occasioned the second collision, as it was the natural result of the system which has been in practical operation for some time past in working traffic between London and Rugby on the main lines. Under this system, danger signals are allowed to be passed at 20 miles an hour or upwards, and the usual rule of the railroad that a "Danger" signal must not be passed without stopping, is cancelled altogether. A "Danger" signal on the main line between London and Rugby, according to this practice, simply means a "train on line" between two adjacent telegraph stations. The locomotive department are so fully aware of the importance of this change, that they are anxious to establish a distinct signal that will simply indicate "train on line," and not "Danger." But the fact is, that a "train on

line," in certain positions, as in this case, becomes a positive danger, and should be so treated. I have no doubt that the adoption of this system of working traffic has saved the London and North-Western Railway Company from many collisions on their main line, as it is vastly superior to an interval of time between following trains at the stations, but it is manifestly insufficient to provide for the public safety under such circumstances as I have mentioned. It is also quite possible that this second collision might not have happened if the up express passenger train had been provided with a much larger proportion of breaks on the carriages than two out of 16.

1. The best mode of avoiding a similar mishap in future, which might be attended with very much worse results than in this instance, would be to interpolate as many more telegraph stations between London and Rugby as now exist, thus, reducing the distance between them to about a mile apart, and to work the traffic on the block system. I am quite aware that this involves a considerable annual expenditure.

2. I had occasion, when inspecting the third line of rails between Bletchley and Tring, in February last, to suggest that the assistance of the telegraph should be provided for working the traffic on the up goods line, and I have much pleasure in stating that I understand the directors of the London and North-Western Railway Company have ordered the telegraph to be erected for the third line, and to be used in working the traffic.

3. The locomotive department of this company have also made another improvement by adding a second or loud whistle to the engines, but instructions are required to be issued that this loud whistle should be the one always used when the guard's breaks are required to be put on, and the small whistle to be used to give warning of the approach of a train to a level crossing, junction, or station, as well as to take off the breaks when the speed has been sufficiently reduced. Mistakes will not then arise as to the fact of the breaks having or not having been whistled for.

4. If the directors of the London and North-Western railway cannot make up their minds to work the traffic on the block system, it will be the more necessary that a very much larger proportion of break power should be afforded to their fast passenger trains, as well as to their mineral and goods trains, than is at present allowed them.

The driver of the second coal train with one break van to 33 other vehicles, gave it as his opinion that his train could not have been stopped under the distance of a mile with the means which had been placed at his disposal, on the falling gradient of 1 in 341 on which he was then running.

LONDON AND SOUTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
9th November 1865.*

SIR,

I AM directed by the Lords of the Committee of the Privy Council for Trade to transmit to you, to be laid before the Directors of the London and South-Western Railway Company, [Bristol and Exeter Railway Company,] the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 19th October last, near Cowley Bridge Junction, on the

Exeter and Crediton Railway, between a passenger train belonging to the London and South-Western Railway Company and a goods train belonging to the Bristol and Exeter Railway Company.

I am, &c.

W. D. FANE.

*The Secretary of the
London and South-Western
Railway Company.*

*The Secretary of the
Bristol and Exeter
Railway Company.*

*Sandown, Isle of Wight,
4th November 1865.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your Minute of the 23rd ultimo, the result of my inquiry into the circumstances which attended a collision that occurred on the 19th ultimo, on the Exeter and Crediton branch of the London and South-Western Railway near Cowley Bridge Junction, from a narrow gauge up passenger train belonging to that Company overtaking and running into a broad gauge up goods train belonging to the Bristol and Exeter Railway Company, on which occasion three passengers are said to have been slightly and the guard of the goods train seriously injured.

The Exeter and Crediton branch joins the Bristol and Exeter Railway at Cowley Bridge. It is a single line on the mixed gauge worked with the train staff, and the Bristol and Exeter Railway Company have the right of running goods trains on the broad gauge line, but the branch now belongs to and is managed by the London and South-Western Railway Company.

All trains proceeding to Exeter from Crediton are by the regulations directed to be running at such speed as will enable them to be stopped dead at the Cowley Bridge Junction up distant signal, if that be on at danger.

On the evening in question, the 7h. 43m. Bristol and Exeter up goods train of 33 waggons, one guard and one break van, left Crediton station for Exeter at 8h. 49m., rather more than an hour late; it stopped, according to the driver, 12 minutes at St. Cyres station, $4\frac{1}{2}$ miles from Exeter, and three miles from the Cowley Bridge Junction, and left at 9h. 13m. p.m., and as it approached the junction the driver found the up distant signal on at danger against him, and he kept sounding the steam whistle, and was running at from six to eight miles an hour, till it was taken off, before he reached it. He also says that he felt the other train run into his own train, but did not stop; as he thought he had got the whole of his train, and was not dragging any part of it; he slackened speed on Cowley Bridge, and was told by the Bristol and Exeter policeman to go on to Exeter. He noticed the bump at 9h. 21m.

I did not see the guard of this train, who was seriously hurt, but I am told that he has stated that the train left St. Cyres at 9h. 15m. and that the collision occurred at 9h. 22m.

The up passenger train which ran into the Bristol and Exeter up goods train was the narrow gauge 7h. 5m. p.m. up passenger train due to leave St. Cyres station at 9h. 16m. It consisted of a tank engine, four carriages, and two break vans with two guards, and it left Crediton at its proper time, 9h. 10m., and when it approached St. Cyres station the driver felt some uncertainty as to the character of the light at the distant signal, it was half white and half red; and he states that he stopped dead abreast of it, and was signalled forward to the platform by the station master with a hand lamp, as it is admitted that the lamp at the station signal was not burning properly, and did not give a good light. Some conversation passed between the driver and a porter, as to the cause why the train had been detained outside the station, and the porter states that he told the driver that the goods train had not been gone long enough for him to come in; but this is distinctly denied.

Some of the passengers heard the altercation, and have informed the officers of the Bristol and Exeter Railway Company that something was said about the goods train not having been gone long; but there is no proof that the driver was made aware that the goods train was on the line in front of him, an hour behind its proper time.

The driver and guard of this train agree in stating that they left St. Cyres three minutes late, or at 9h. 19m. The station master says that it arrived and left about 9h. 20m., and the porter gives the time of

its arrival as 9h. 15m., and 9h. 20m. for that of its departure. The driver says that he shut off the steam at the usual place, Newbridge, one mile from the junction, and sounded the whistle twice, and the breaks were on to stop at Cowley Bridge, and that in going round a curve he saw a red light about 250 yards in front, and took it to be the Cowley Bridge up distant signal, as it appeared to be at a stand-still, and that he then did all in his power to stop. The guard in the leading van says the driver whistled for the signal to be taken off and to give warning that he was coming, as he could not see the signal when he sounded the whistle; that he put on his break a quarter of a mile from the spot where the collision took place, and he was not aware that anything was wrong until it happened. The driver thinks that they must run 30 miles an hour between St. Cyres and Exeter in order to keep time, and that he was running at from 10 to 12 miles an hour—the guard names 12 or 13 miles an hour—when they ran into the van at the rear of the Bristol and Exeter goods train, and threw it and a meat van and truck immediately in front, off the rails, smashing the truck to pieces, and greatly damaging the two vans, and leaving them at the sides of the line. The engine of the passenger train had its buffer plank and buffers broken, and the guard's van next to the engine was also somewhat damaged. The driver says the collision occurred at 9h. 24m. or 9h. 25m., and the guard names 9h. 25m. p.m. It happened near the commencement of a cutting a short distance north of Upton Pyne over bridge, and about 730 yards north of the Cowley Bridge up distant signal, where, from curves in the line and bushes at the side, the view of the single tail light on the goods train could not be seen by a following train for some distance back along the line, at more than 300 yards distance.

This train, as well as the goods train, is allowed 10 minutes between St. Cyres and St. David's station, Exeter, and, if this time is to be kept, it is certain that they must run at a much higher rate of speed than that named by the driver of the passenger train (30 miles an hour); so that if the driver did not receive any caution from the porter at St. Cyres station, which I think probable, I see no grounds for blaming him, and have no reason to doubt that he did his best to avoid the collision. If the train had been fitted with continuous breaks it is probable that the collision would not have taken place.

The station master and porter at St. Cyres, on the day after the collision, informed the superintendent of that section of the London and South-Western Railway, that the Bristol and Exeter up goods train arrived at about 9h. and left at 9h. 10m. p.m., and their statements were then taken down in writing; but they now assert that it left much earlier, but cannot state the exact time. On the other hand, the fireman of the goods train says that as that train was leaving St. Cyres station he saw a head light on the engine of the passenger train as it was approaching the station; and the fact, which is not disputed, that the passenger train was delayed outside the station, goes to prove that the goods train had not long left for Exeter; and I am thus compelled to arrive at the conclusion that no dependence can be placed on the statements made by the station master and porter with reference to the time when the goods train left St. Cyres station.

The Company's Regulations, page 29, direct that "goods trains must not be started from any station within 15 minutes of the time of a passenger train being due, and must shunt at the nearest station when a passenger train is due within a quarter of an hour." It appears certain that the first part of this rule was disobeyed, and the second part could not be acted upon, as the siding at St. Cyres station is not long enough to allow the goods train to have been shunted out of the way of the passenger train.

The collision resulted from a want of punctuality in the running of the Bristol and Exeter goods train, and the dispatching of a following fast train shortly

after it left ; and I consider that the St. Cyres station master was much to blame for not having distinctly cautioned the driver of the passenger train that a goods train was ahead before he allowed him to leave for Exeter. No proper record appears to be kept of the times of arrival and departure of trains, which is of importance in the working of traffic on all lines, as it tends to ensure the observance of the regulations, and is highly essential on single lines.

I recommend the introduction of the electric telegraph on this line as the best means of avoiding collisions, by working on what is known as the block system, by which no two trains are allowed to be between two adjacent telegraph stations on the single line at one and the same time.

It must be noticed that the Bristol and Exeter goods train was not provided with side lights at the tail of the train, by which the driver could ascertain by night whether any portion of his train had from any cause broken away. It does not appear to be the practice on the Bristol and Exeter Railway to provide these side lamps for goods trains. It is scarcely necessary to observe, as the fact is so evident, that the sooner a change is made in this respect the better, as there are heavy inclines on this system, where the separation of a train into two parts unknown to the driver might lead to very serious collisions.

A greater amount of time than 10 minutes should be allowed for running the goods train between St. Cyres and St. David's station, Exeter.

The proportion of break power allowed to this goods

train was much too small. I do not, however, mention it as having in any way contributed to the collision.

*The Secretary
Board of Trade.*

I have, &c.,
W. YOLLAND,
Col.

SIR,

Bristol, 27th November 1865.

YOUR letter of 9th instant and accompanying report by Col. Yolland of his inquiry into the collision on the London and South-Western (Exeter and Crediton) line near Cowley Bridge, between a narrow gauge passenger train and a broad gauge goods train, were duly laid before the directors of this company ; and in reference to the two suggestions concerning the company's trains, I am instructed by the Board to state that they had already, before and independently of this occurrence, ordered additional break power for all the goods trains, which is in course of being supplied as quickly as the additional break vans can be turned out ; and in deference to Col. Yolland's suggestion, they have now ordered side lights, in addition to the end or tail lights, to be provided for goods trains, as already done for passenger trains.

To the Secretary
of the Board of Trade
(Railway Department),
Whitehall.

I have, &c.,
A. MOORE,
Secretary,
per A. W. C.

LONDON AND SOUTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 11th Dec. 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and South-Western Railway Company, the enclosed copy of the Report made by Colonel Yolland, the officer appointed by my Lords to inquire into the accident which occurred in the Black-boy Tunnel of the London and South-Western Railway on the 25th ultimo.

I am, &c.

*The Secretary of the London and South-Western
Railway Company.* J. EMERSON TENNENT.

*Railway Department,
Board of Trade,
Whitehall, 7th Dec. 1865.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your instructions of the 29th ultimo, the result of my inquiry into the circumstances which attended an accident that occurred on the 25th ultimo, in the Black-boy Tunnel, situated about a mile east of the Queen Street station, Exeter, of the London and South-Western Railway. No passengers were injured, but the guard of the train was slightly hurt.

It appears that as the 7.15 a.m. train from Yeovil to Exeter, which consisted of engine and tender, three third class, one second class, and one first class carriage, with a guard's van placed next to the tender, was passing through this tunnel at a moderate pace in order to stop at the ticket platform, it ran into a mass of earth, rock, and bricks lying on the down line of rails, and the engine and tender, van, and the third-class carriages were thrown off the line, and the train was brought to a stand still. The passengers got out of the carriages and walked through the tunnel towards the station, and some time afterwards some more of the roof of the tunnel gave way

and crushed in the top of one of the third class carriages. But little damage was done to the engine or the other carriages.

The tunnel is about 12 chains in length, and it is lined throughout with brickwork built in mortar, both at the sides and in the arch, where there are five rings of brickwork. The line at this part is on an incline of 1 in 100, falling towards Exeter, and the portion of the roof of the tunnel which fell in, about 23 feet in length, is situated rather more than 100 yards from the east end of the tunnel. The rails are about 63 feet below the surface of the ground. There is a slight curve in the line, so that the driver of the train would have no means of seeing the obstruction on the road until he ran into it.

The line was opened for traffic in July 1860, and there was no particular difficulty previously experienced in constructing this tunnel, as the soil consisted of red brick earth, marl, layers of red sandstone, separated by marl and sand, with but little water in it ; but there was a heavy slip in the cutting west of this tunnel about two years since, and another heavy slip has taken place since the accident in the tunnel, close to but on the eastern side of the tunnel, blocking the up line of rails. The passenger traffic was interrupted from the morning of the 25th ultimo to the morning of the 3rd instant, when it was resumed, and is still continued, on a single line of rails.

When I visited the tunnel on the 5th instant, I found that the company had taken the necessary preparatory measures for repairing the arch by propping it for some distance, longitudinally, on each side of the opening in the roof, which had also been boarded up to prevent any more earth or rubbish falling on to the line ; and they had commenced the excavation of a shaft from above to enable the new arch to be turned, and had determined to line the tunnel with a brick wall for a length of about 20 feet on each side of the opening. In consequence of these preparatory measures I did not actually see the hole in the roof of the tunnel, but I was informed by the engineers, Messrs. Strapp and Galbraith, that there

was an arched space of about 20 feet in height above the crown of the tunnel, that there was no appearance of any quantity of water, that the brickwork in the arch of the tunnel was of an ordinary quality, but that the workmen had neglected to pack up the holes above the arch from which the draw logs had been taken out.

It is surmised, for there is no positive proof, that a large piece of rock which was found on the down line, and was pushed ahead when the engine came in contact with it, had fallen from the arched space on to the top of the arch and had crushed it in.

The Railway Company do not appear to have had any notice whatever that such an accident was likely to occur, as the ganger in charge of the length in which this tunnel is situated walked through it at 8 a.m. (and no less than five trains had passed through it

before the portion of roof fell in at 9.20 a.m.) without noticing that anything was wrong.

The construction of two side walls in the tunnel, each of about 14 inches thick, will contract the dimensions of the tunnel somewhat more than the original size of the opening will properly admit. It is most probable that no accident to any person may result from this alteration, but it is necessary to call attention to the fact, that the original dimensions of the tunnel, as it was when the line was authorized to be opened for traffic by the Board of Trade, will have been varied.

I have, &c.

Whitehall, 29th July 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company for their consideration, the enclosed copy of the Report made by Capt. Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred on the 16th of May last, at Deepcar station.

I am, &c.

W. D. FANE.

*The Secretary to the
Manchester, Sheffield,
and Lincolnshire
Railway Company.*

*Broadstairs,
26th July 1865.*

SIR,

IN compliance with the instructions contained in your minute of the 31st May last, I have now the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 16th of that month, between a passenger train and a coal train, at the Deepcar station of the Manchester, Sheffield, and Lincolnshire Railway.

This station is $33\frac{1}{2}$ miles to the east of Manchester, and $7\frac{3}{4}$ miles to the west of Sheffield. There are no platform signals, which are required; but there is a distant signal worked by a wire from the station, and 465 yards from it, in the direction of Wortley and Manchester. The Wortley and Deepcar stations are less than a mile apart, and the gradient is 1 in 120 falling towards Deepcar. The distant signal from Deepcar is first visible to an engine driver 150 yards after he leaves Wortley, and may be seen, though not very distinctly, for 120 yards. It is then lost sight of, in consequence of the position of an intervening over-bridge, for 230 yards; and at the end of that distance it is visible for 680 yards, until it is passed. The immediate approach to the Deepcar station being on a curve, any obstruction on the line at the station can only be seen for a short distance, and a train on the cross-over road west of the station platforms is visible to an approaching engine-driver for about 250 yards.

On the day in question, the 8.35 a.m. coal train left Dunford Bridge punctually; but, it was detained *en route* by a goods train, and it reached Deepcar about a quarter to one o'clock, 50 minutes late, consisting of an engine and tender, nine waggons, and a break-van. As there was no room in the siding, it was left on the up main line while the 10 a.m. express passenger train from New Holland to Man-

chester passed through on the down line. The engine had, indeed, been uncoupled from the waggons and sent into the siding to do some shunting, but it had rejoined them again on the up line before this express passed. The coal train remained in the same position while the train from Eckington to Wortley, due at Deepcar at 12.55, passed, also on the down line. The coal train was then put in motion towards the down line by the cross-over road west of the passenger platforms, to clear the up line for the 10 a.m. passenger train from Liverpool which was due upon that line; but as it was setting back, the passenger train came up and struck the break van and six coal waggons which were in front of it.

The passenger train left Liverpool at 10 a.m. and Wortley at 1.5, one minute late, composed of an engine and tender, a dummy van, four carriages, and a break-van. It was not due to stop at Deepcar, and the engine-driver states that the distant signal from that station was at all right as he approached it and passed it, as well as that the first signal of danger that he received was from the driver of another train which passed him travelling in the opposite direction, about half way between the station and the signal. He then did his best to pull up, and he reduced his speed from 27 or 28 to 7 or 8 miles an hour before the collision occurred.

The fireman, the guard, and a porter who was riding with him in his break-van, all corroborate the above statement of the engine-driver, though the evidence of the guard and the porter was not given by any means in so truthful a manner as that of the engine-driver and the fireman.

The engine-driver and fireman of the down train from Eckington who warned the engine-driver of the up passenger train, left Deepcar about 1.6, and having seen the coal train standing there on the up line, naturally recognized the danger as imminent, when they met the up train with steam on, travelling at high speed, inside the distant signal. They noticed that the signal was at danger, but they could not say whether it had been so before the engine-driver of the up train passed it.

A relieving clerk who had been sent down that morning to take the stationmaster's duty at Deepcar, was away from the station between 12 o'clock and a quarter to one, and found the coal train standing on the up line on his return; but he did not look at the signal before the collision, not considering as he stated to me, that it was any part of his duty to do so. Taking an erroneous view of his responsibilities, he appeared to consider that as there were porters to attend to the signals he was by no means bound to use that general supervision or to show that activity which are so much required in railway working, and which may be especially looked for in a man recently appointed who is anxious to ensure the safety of the traffic.

Of the two porters who are regularly employed at the station, and who attend to the signals between them, one was away, and his place was supplied by a relieving porter, while the other was taking charge of the signals. This man, Edwin Barber, had been at the station for two years; and he asserts that he turned the distant-signal to danger when he first saw the coal train approaching the station, and did not take it off again, or even go near the lever until the accident occurred.

His statement is corroborated by the servants of the Company who were with the coal train.

The engine-driver of that train found the signal at all right as he approached it, but noticed that it was turned to danger as soon as he whistled, and after he passed it. He saw afterwards, when he crossed the down line to the siding with his engine, and also when he began to shunt his train to the down line, that it remained at danger.

The fireman noticed that it was at "all right" when he first approached it, that it was "at danger" when he next looked at it, as he crossed to the siding before the express train passed from New Holland; and that it remained "at danger" when they were crossing to the down line just before the collision.

The guard also saw the distant signal at "all right" as he first approached it from Wortley, but noticed that it was turned to danger when he had gone 150 yards past it. He looked at it when the engine crossed to the sidings, before the express train passed from New Holland; and again, from the wagon on which he was standing, as they were crossing from the up to the down line just before the collision.

The evidence as to the state of the distant signal was thus of a conflicting character, but I came to the conclusion after hearing it, that this signal was turned to danger shortly after the coal train passed it, that it remained at danger until the collision occurred, that the engine-driver of the train from Liverpool missed seeing it as well as the fireman, and that they, as well as the guard and his companion, then gave false evidence in regard to it.

I believe, therefore, that the first cause of the accident was the neglect of the engine-driver of the Liverpool train, in not keeping a better look out, and in not seeing the distant signal from Deepcar; but I can have no doubt that the disadvantages under which, as I have already explained, this signal works, in being invisible to an approaching driver for 230 yards between the first and second view that he obtains of it, must have conduced to this result; and it is desirable that this defect should be removed, either by an alteration in the position of the signal, or by the employment of a high and a low signal, one of which shall always be visible to an approaching driver.

Looking to the character of the line and the extent of the traffic, it is also exceedingly desirable that the telegraph should be brought into use as an auxiliary in securing safety; and I make this observation with the full knowledge and conviction that its employment upon this part would necessarily be followed by its extension to other parts of the line.

Another cause of the collision was the want of extra siding accommodation, to afford a means of refuge for this unpunctual coal train. As will have been observed, it was necessarily retained on the up main line, after its arrival, while two passenger trains passed through the station on the down line; and it could not then be moved to the down line in time to clear the up line for the passenger train from Liverpool and Manchester. The general accommodation at this station is indeed of the most wretched description. Its improvement or reconstruction must have been long in contemplation, and it is to be hoped that it will now be carried out with as little delay as possible.

I am, &c.

Board of Trade.
Whitehall.*

H. W. TYLER,
Captain, R.E.

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 20th November, 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 13th ult., near the Silkstone Station on the Barnsley branch of the Manchester, Sheffield, and Lincolnshire Railway.

I am, &c.

W. D. FANE.

*The Secretary of the
Manchester, Sheffield, and
Lincolnshire Railway Company.*

SIR,

Sheffield, 10th November, 1865.

IN compliance with the instructions contained in your minute of the 31st ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 13th ultimo, near the Silkstone Station of the Manchester, Sheffield, and Lincolnshire Railway.

This station is situated on the Barnsley branch, at $3\frac{1}{4}$ miles from Penistone, and $4\frac{1}{2}$ miles from Barnsley. It is approached from Penistone on a falling gradient of 1 in 100. There is a distant-signal in that direc-

tion, near an over bridge, called Johnson's Bridge, about 500 yards from the platform. And there are sidings outside of the distant-signal to the Hadley Main Colliery, and inside of it (called Clark's Siding) towards the station. The distant-signal is visible in clear weather to an approaching engine-driver, in the first instance for about a mile, and afterwards, on his coming out of a short cutting, for rather more than 400 yards.

A coal train left Penistone at 5.25 on the evening in question for Mexborough. It stopped for 8 minutes at the Huddersfield Junction to take on 27 waggons, and 10 minutes at the Barnsley Junction to put off 5 waggons; and it reached Johnson's Bridge near Silkstone at 5.57, the regular passenger train having been due in following it to reach Silkstone at 6.4. It was composed of an engine and tender, 38 waggons, and a van, of which 15 waggons were to be left in Clark's Siding. But as these 15 waggons were not together, they could not all be run down into the siding by one operation. In sorting them, first 5, then 4, and then 6 were placed in the siding, and the engine returned as soon as possible, in order that the train might be reunited and proceed on its journey. After the engine had been coupled on, and the guard had given a signal to start, the station-master from Silkstone (who was assisting with one of his porters) saw the passenger train approaching; and it was discovered at the same time that 5 waggons and the van had accidentally become uncoupled at the back of the goods train. The break of the van was on, and there was a *sprag* in a wheel of one of these waggons,

and there was no time to liberate them. The engine of the passenger train came into collision with the van of the goods train at 6.15, with sufficient violence to break it up, and to do considerable damage to three of the waggons. The life guards of the engine were knocked off, and the buffers were broken. Four of the passengers have complained of injury.

The passenger train left Penistone at 6.0, five minutes late, consisting of a tank-engine, 5 carriages, and a van. The engine-driver had seen the goods train start from that station at 5.30, but expected that it would have gone farther on its journey. He was asked by the guard to "get on as well as he could, to get into Barnsley before the other train." I should explain in reference to this remark, that there was a train due at Barnsley from Doncaster (in the opposite direction) a few minutes before this train from Penistone; and for want of a second platform the Penistone train is commonly kept outside for about 10 minutes, or until the Doncaster train has left the Barnsley platform, when it arrives after that train.

After coming out of a tunnel more than a mile from Silkstone, the passenger driver looked out for the distant-signal, but could not see it. He says that he first caught sight of it after passing through the succeeding cutting, and when he was within about 320 yards of the goods train; and he saw the lights at the back of the goods train at the same time. Having shut off his steam three quarters of a mile before, he then applied the tender break, whistled for the guards' break, sanded the rails, reversed his engine, and put on steam against it. He passed over a fog-signal after he had seen his danger, and, as he thought, about 80 yards from the goods train. But the guard of the goods train, who dropped off his van to put this fog signal on the rails while his train was in motion, and the station-master, who found the fog-signal the next morning, assert that it was about 260 yards behind the goods-van. The goods-guard states that having already used five on that morning, he had only one fog signal left, and that it did not occur to him to ask for a fresh supply before leaving Penistone.

The guard of the passenger train had a second-class carriage coupled to his van with Fay's continuous breaks. His van was provided with glass to the front, and was next behind the engine. He states that there was no signal visible until after they had passed over the fog-signal, because the night was so thick. He applied his breaks, which were in good order, as soon as he heard the engine-driver whistle for them; and it appeared to him that they had no sooner gone over the fog-signal than they struck the van of the goods train.

That van stood 75 yards outside of the distant-signal; and the fog-signal, even if it was, as is asserted, and seems probable, 260 yards behind the van, was

still of no use to the engine-driver of the passenger train, because he saw the lights of the van about 60 yards before he reached the fog-signal; and the 320 yards from which he appears to have seen those lights was an insufficient distance to allow for stopping a train on slippery rails and on so steep a gradient.

As trains are in the habit of stopping daily at this distant-signal (which is only properly available as a protection to the station) for shunting purposes, it is plain that distant-signals should be provided in both directions from these sidings for their protection. On inquiring from the station-master whether he had not made any recommendation to his superiors on this subject, I was informed by him that he had "complained generally of the unprotected condition of the colliery sidings, but not particularly of the sidings at Johnson's Bridge." It would appear, therefore, that there are other sidings at which signals are much required.

The Barnsley branch of the Manchester, Sheffield, and Lincolnshire Company has now been opened for about 11 years as a single line, and it is worked on the train-staff system. The coal train had been provided with a train-ticket, and the passenger train was following it with the train-staff. There being a double line at each end of the single line, and it being impossible apparently, under the weight of the traffic, to avoid thus sending shunting coal trains in front of the passenger trains on these steep gradients, it is desirable that a second line of rails should be laid down with as little delay as possible.

It appears from the statements of the signalman at the Barnsley Junction that the passenger train was telegraphed when it passed that junction to Silkstone; but the message was of no use to the station-master, who was 500 yards nearer to that junction than the station, expediting the shunting of the coal train, and doing his best to complete its work and get it out of the way. The one signalman relieved the other at the junction at 6 p.m., between the departure of the coal train and the passage of the passenger train; and it was perhaps owing to this circumstance that the engine-driver of the latter train received no warning, as he says was customary, that the coal train was about to shunt at Johnson's Bridge, and how many minutes it was in front of him. The engine-driver says he looked out for such a warning, and, not receiving it, he had certainly the less reason to expect that he would find the coal train shunting, and comparatively unprotected, at Johnson's Bridge.

Whitehall, 29th November 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred near the Oughty Bridge station on the 24th ultimo.

I am, &c.
T. H. FARRER.

*The Secretary of
Manchester, Sheffield, and Lincolnshire
Railway Company.*

*Hampton Court,
22nd November 1865.*

SIR,

IN compliance with the instructions contained in your minute of the 31st ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 24th ultimo between a passenger train and a goods train, near the Oughty Bridge station of the Manchester, Sheffield, and Lincolnshire Railway.

This station is $4\frac{1}{2}$ miles to the west of Sheffield. It is protected by a station-signal on the passenger platform, visible for 240 yards towards Sheffield, and by a distant-signal, 310 yards to the east of the station signal, and visible in clear weather for 450 yards. The gradient rises from the direction of Sheffield

1 in 132, and the view is much obstructed by the curved state of the line, by a hill on the north of it, and by a bridge over it near the station.

A pick-up (No. 13 down) goods train reached Oughty Bridge at 8 o'clock on the morning in question, an hour and ten minutes late. A portion of the train was detached and sent forward, and the engine-driver shunted certain of the waggons into the down siding, and dropped others back against the body of the train on the down line. In the course of putting the last of the waggons into the siding, the driver was called back to "give the man extra push;" and as he pulled up, the draw-bar of one of the waggons gave way.

At 8.7 or 8.8 another goods train arrived on the down line, and came to a stand behind the first train. There was no siding which would contain either of these trains, and they could not be shunted across to the up line until the disabled draw-bar had been repaired. The driver had set it to rights, and was rejoining his train to take it across to the up line, when the 8 a.m. passenger train from Sheffield came into collision with the van behind the second goods train.

This goods train left Retford at 5.30 a.m., three hours late, because it had arrived late on the previous journey from Sheffield, and because its engine had been taken away for the goods train from London to Manchester. It left Sheffield for Oughty Bridge at 7.50, 3h. 50m. late. The guard remarked to the foreman at Sheffield when he saw the pick-up goods train going before him, that he ought to be allowed to start first. But the pick-up train was also late, and it appears that the foreman was obliged to get the trains through as best he could.

When this second train came to a stand behind the pick-up train, the van was near the bridge above referred to over the line, at 170 yards from the station-signal, and 140 yards within the distant-signal. The guard states that he went back to protect it, and had gone beyond the distant-signal when he heard the passenger train coming. He ran back with both arms up to stop it, and heard the engine-driver whistling for the breaks. He noticed that the engine was reversed when it passed him. He saw no fog or mist. The buffer of his van was broken, and it was buffer-locked with the waggon in front of it, but neither the van nor any of the waggons were thrown off the line.

The passenger train was composed of an engine and tender, a dummy-van, three carriages, and a break-van. It left Sheffield at 8.5 a.m., 5 minutes late. There was fog hanging about, but it was clearing away, and a little rain was falling. The rails are stated to have been very slippery. The engine-driver perceived at 350 yards from the Oughty Bridge distant-signal that it was at danger. He shut off his steam, and whistled for the brakes, and he reversed his engine shortly afterwards, on catching sight of

the goods train. He thought that the guard of the goods train was not more than 70 yards from his van. He reduced his speed from 30 to 6 miles an hour before the collision occurred, and he believes that he could have avoided the collision if his guard's break had acted properly. He appears, indeed, to have had about 490 yards, 350 before he came to the signal, and 140 after he passed it, in which to pull up.

The guard of the passenger train states that he complained to the platform inspector at Sheffield before he started that his break wanted to be taken up, but no one could be found to adjust it at the moment, and no other break-van was immediately available, and it was therefore sent forward without alteration. I was unable to examine the inspector when on the spot, as he had met with a serious accident, and was believed to be in a dying condition. The carriage-examiner who was on duty during the previous night had not noticed the defect, but the carriage-inspector at Manchester had his attention directed to the break-van after the collision by the engine-driver and guard of the train, and he found that the break required to be taken up one hole, and adjusted it accordingly.

The engine-driver does not appear to have had any idea before the collision that the break of the van was not in good order. Having regard to this circumstance, and to the distance which was afforded for stopping the train, I cannot attach blame to him.

The other causes of this collision, from which four passengers have suffered, demand similar remedies to those recommended in my report of this date upon the collision which occurred at the neighbouring station of Deepcar. Extra siding accommodation is required, that the goods trains may be kept out of the way of the passenger trains, the telegraph should be employed for obtaining increased safety in working the traffic, and the signal arrangements should be improved. The existing station-signal being visible for only 240 yards, it is the more necessary that the distant-signal should be thoroughly efficient. I recommend that the present distant signal be used as a repeater to a second distant-signal placed at a greater distance from the station, because it is not possible to place one signal in such a position that it may in all weathers and under all circumstances give sufficient indication to an approaching engine-driver, and be also seen from the station.

I could not but observe in walking over portions of this line that the sleepers were in urgent want of renewal, and I think it right to take this opportunity of directing attention to their condition.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.

Board of Trade
(Railway Department),

SIR, Whitehall 28th November, 1865.

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, for the consideration of the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company, the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred at the Deepcar station on the 6th inst.

I am, &c.

The Secretary of the
Manchester, Sheffield,
and Lincolnshire
Railway Company.

J. EMERSON TENNENT.

SIR,

Hampton Court,
22nd November 1865.

IN compliance with the instructions contained in your minute of the 8th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 6th instant, between a passenger train and a cattle train, at the Deepcar station of the Manchester, Sheffield, and Lincolnshire Railway.

This station is $7\frac{3}{4}$ miles to the west of Sheffield, and is approached from the east on a rising gradient of 1 in 130. There is no platform or station signal, but there is a distant-signal 411 yards on the east of the platform, which is visible for 340 yards towards Sheffield.

On the afternoon in question a train known as the Thurgoland coal train reached Deepcar at 4 o'clock, upwards of 4 hours late, its engine having been employed in shunting at intermediate stations and at Sheffield. The same engine was engaged also in shunting waggons in and out of the Deepcar siding until 4.45, when a pick-up goods train arrived on the same (down) line from Sheffield, and was brought to a stand behind the van of the coal train. The guard of the pick-up train inquired of the guard of the coal train why he was so late, and the station master sent the coal train forward to Dunford, and shunted the pick-up train from the down to the up line that it might be out of the way of the fast passenger train due to leave Sheffield at 4.40 for Manchester. While the pick-up train was thus crossing from one main line to the other, and just as it had cleared the down line, a mixed goods and cattle train (running when required on Mondays) drew up to the passenger platform. This cattle train was stopping to follow the pick-up train across to the up line when the passenger train came into collision with it at a speed which is stated by the engine driver and guard of the latter to have been 7 or 8, but by the guard of the former have been 10 or more miles an hour.

The mixed goods and cattle train consisted of an engine and tender, 22 loaded, 4 empty waggons, and a break-van. It started from New Holland at 10.15 a.m., 10 minutes late, for Ordsall Lane, Manchester, and it left Sheffield at 4.30, an hour and 15 minutes late, having been delayed at Retford and other stations by other trains in front of it. Knowing that the fast passenger train was timed to leave Sheffield for Manchester at 4.40, the guard of this mixed train remarked to the inspector, before he started from that station, that it was nearly due; but the inspector replied that there were two other trains behind the mixed train, that he could not shunt that train at Sheffield, and that it must go forward. It proceeded accordingly,—to shunt to the wrong line at Deepcar, but was somewhat delayed in doing so in consequence of the pick-up train having been in the way, as I have already described.

The guard of the cattle train states that on reaching Deepcar, he first looked to see what was doing at the station, and then got into his van to take off his break, that the train might go ahead to be shunted. But he saw the passenger train approaching behind him, and noticed that the driver of that train had his steam on (probably *against* the engine) when he was within the distant signal; and he then ran back for a short distance, though too late to be of use, to protect his train. He did not expect the passenger train so soon, because he had heard some one in the Sheffield yard say that it was a little late. The buffers of his van were broken, and six of his waggons were partly thrown off the rails by the force of the collision.

The passenger train was composed of an engine and tender, a dummy van, one first, one second-class, and two composite carriages, and a break-van. It left Retford 2 minutes, and Sheffield 10 minutes late. The engine-driver found the signals all right at Wadsley and Oughty Bridge, and looked out for the signal at Deepcar. He thought, he says, at first, that the lamp was not upon it; but on nearing the post he saw, from a distance of about 30 yards, a red light showing through "a glass black with smoke." There was "a thick hazy rain" at the time; it was "getting dusk," and the rails were slippery. He saw the lamp and arm of the signal and the lights of a train at the station almost at the same moment, while he was travelling at a speed of 27 or 28 miles an hour; and he then, of course, did his best to pull up.

The collision occurred 311 yards within the distant signal and 100 yards from the passenger platform. Neither the engine nor any of the carriages of the passenger train left the rails or were damaged; but four of the passengers had complained of injury, who were all, I believe, preparing to alight at Wortley, the next stopping station, for the purpose of visiting a noble lord who resides near it, and is one of the directors of the company.

The porter at Deepcar states that he lighted the lamp of his distant-signal at 3.30 p.m., that he turned the signal to danger at 4.20, and that it so remained until the collision occurred. The acting station-master at Deepcar saw the porter light the lamp "a little before 4 o'clock," and take it to the distant-signal; and he saw the lamp burning brightly after the collision. The engine-driver of the passenger train asserts that the lamp-glass must have been cleaned after the collision, as it showed a different light afterwards when he backed his train to Oughty Bridge. The guard of the passenger train went back to protect it immediately after the collision, and "looked particularly at the distant signal." He observed that "the glass (of the lamp) was smoked, and it did not show a good light, but it was at danger."

In this case the Deepcar station was hopelessly obstructed by goods traffic at a time when it ought to have been clear for the passage of a fast passenger train. The coal train, 4 hours late, was in the way of the pick-up goods train; the pick-up train, also very late, was in the way of the goods and cattle train; and the goods and cattle train, an hour and a quarter late, was sent forward from Sheffield, in spite of the remonstrances of the guard, in front of the passenger train, to shunt at a station where there was no siding to contain it. The Sheffield inspector acted, no doubt, under the pressure of necessity, but the fact of his having done so points to the want of extra siding accommodation, which is urgently required at Sheffield as well as at Deepcar.

The circumstances of this collision are very similar to those of the collision at the same station on which it became my duty to report in July last. There was the same difficulty of getting a coal train from one main line to the other, out of the way of a fast passenger train not due to stop at Deepcar. The one collision, however, occurred on the up line, and the other on the down line. The distant-signal towards the west has since that date been improved, in accordance with my recommendation, by the addition of a second arm upon it, which may be seen under the bridge which obscures the upper arm for a considerable distance. I have now to recommend again that station signals shall be provided, and further, that the signal arrangements to the east shall also be improved. It is desirable that the existing distant signal in that direction should be used as a *repeating signal* only, and that a second distant-signal should be added in connexion with it, which may be seen by approaching engine-drivers in foggy as well as in clear weather, at a greater distance from the station.

I would beg to repeat here, also, my further recommendation in the report above referred to, that the telegraph should be brought into use as an auxiliary to safety. Having regard to the character of this line, its steep gradients, sharp curves, and obstructions to view, and its heavy traffic, there can be no doubt that it is one on which a good system of block telegraph working is urgently required.

I have, &c.

Whitehall, 1st December, 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company, the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred at the Woodburn junction of the Manchester, Sheffield, and Lincolnshire Railway on the 8th ultimo.

I am, &c.,

J. EMERSON TENNENT.

*The Secretary of the
Manchester, Sheffield,
and Lincolnshire
Railway Company.*

SIR,

Sheffield, 28th November 1865.

IN compliance with the instructions contained in your minute of the 10th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 8th instant, between a passenger train and a goods train at the Woodburn junction on the Manchester, Sheffield, and Lincolnshire Railway.

At this junction, which is about a mile to the east of the passenger station at Sheffield, the South Yorkshire branch from Barnsley joins the main line. Besides the signals at the junction stage there are a distant-signal and repeater on the branch, and a distant signal towards Sheffield, about 800 yards from the junction. The line is straight from the last-mentioned distant-signal to the junction, and on a rising gradient of 1 in 144. The branch is curved and runs through a cutting towards the junction on a rising gradient of 1 in 80.

The 8.55 passenger train left Barnsley punctually on the morning in question, consisting of an engine and tender and six carriages, of which two were break-carriages, one at each end of the train. The engine-driver approached the Woodburn junction distant-signal at a speed of 16 or 17 miles an hour; and it was turned off in answer to his whistle, as well as the repeater and the main signal. He therefore proceeded forward, but at slackened speed, towards the junction, until, on rounding the curve and coming out of the cutting, he saw a goods train before him. He could not make up his mind in the first instance whether it was moving or standing; but he observed as he got nearer to it that it was travelling towards the junction in the opposite direction. He therefore shut off his steam, reversed his engine, and turned his steam on against it. After shouting to the pointsman to pull the points over and let the goods train go down the branch, he dropped off to avoid the collision which almost immediately followed.

The two engines met, the passenger engine running at a speed of 6 or 7, and the goods engine at a speed of 5 miles an hour. The former had its buffer-plank broken and its framing damaged, and two pairs of its wheels left the rails. None of the carriages were thrown off the line, but some of the windows and buffer-sockets were broken. Four of the passengers complained of injury, and a travelling inspector in the service of the company was somewhat shaken.

The signalman had done duty at the junction for 17 months. He came on duty at 7 a.m. He saw the goods train leave the Sheffield yard and come to a stand inside his distant-signal about 10.15, and having noticed the passenger train approaching from the branch a little before, he lowered his branch signals for that train to pass through about the same time. The goods train advanced towards him, but very

slowly, and without whistling; and he kept his signals up against it. He took it for granted that the goods driver would bring his train to a stand before he reached the junction; and he thought that, seeing the branch signal down, he would suppose it to be useless to whistle for the main signal to be lowered until the branch train had passed. He could not see the goods driver till he was "within 20 yards" of the junction, when "he looked up from a stooping position at the "side of the boiler, as if he had been examining some "thing." The signalman whistled, shouted, and waved his red flag. The driver looked up, saw the signal and the red flag; looked, as if for the branch train; and went back to the footplate of the engine. The signalman turned on the signals against the passenger train, but too late to avoid the collision.

The signalman did not hear the passenger driver shout to him to turn the goods train down the branch, and it did not occur to him at the moment to do so, though he might thus by a simple movement of his switch-lever have prevented the collision.

The goods train left the Sheffield yard at 10.12, with engine and tender, 30 waggons, and a break-van. The servants of the company who were with it state that when the load was made up and the train finally arranged for starting, the engine and some of the waggons extended beyond the Woodburn junction distant signal. It is difficult to understand why this should have been so, because the points leading to the nearest siding are 260 yards outside of that signal. Be that as it may, the engine-driver, an experienced man, proceeded at 6 or 8 miles an hour towards the junction, which he had a perfect right to do, as the company's regulations direct that after having come to a stand at a distant signal at danger he shall draw within it for protection. When half way towards the junction he looked at the signals, and they were then, as he thought, right for him to proceed. He had noticed after he started that his *pet tap* was not working properly, and he went out on the framing to ascertain whether the "copper pin had come out of "the pet tap."

On looking up, after this examination, he found himself close upon the junction, with the branch train approaching, and the signal down for it to proceed. He then did his best to pull up, but too late to do much towards slackening his speed.

His fireman, who had only been acting in that capacity for a couple of months, did not know the position of the distant-signal, or look for any indications from the junction main signal. He was sanding the rails until the train was within 20 yards of the junction.

The goods guard, who has done duty with passenger or goods trains as an extra guard for 4 years, states that the distant signal was "off," but that it was in a position (of caution) at which it never remains. He noticed that the junction signals for the main lines were at danger before he started, but he did not look at them afterwards. He was booking his time and entering his waggons, and knew nothing of the impending collision till he felt the shock.

This collision has evidently been caused by forgetfulness on the part of engine-driver of the goods train, who neglected to look for the junction signals as he approached them, while engaged in the examination of his *pet tap*.

I recommend that glass be added at the sides and in front of the junction stage, for the protection of the signalmen and their apparatus. The signalmen now make use of rough glass frames of their own, which cannot answer so well as windows made to open and shut at pleasure, in order to obtain shelter.

I have, &c.

Board of Trade,
Whitehall.*

*H. W. TYLER,
Capt. R.E.*

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.

*Board of Trade,
(Railway Department),*

SIR, *Whitehall, 13th December 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company the enclosed copy of the report made by Captain Tyler R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision that occurred near the Clarborough Tunnel on the 15th ultimo.

My Lords trust that the Directors will give Captain Tyler's recommendations their careful consideration.

The Secretary of the I am, &c.
Manchester, Sheffield, J. EMERSON TENNENT.
and Lincolnshire,
Railway Company.

SIR, *Hampton Court, 8th December 1865.*

IN compliance with the instructions contained in your minute of the 20th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 15th ultimo, between a passenger train and a goods train, near the Clarborough Tunnel on the Manchester, Sheffield, and Lincolnshire Railway.

The goods yard of the Manchester, Sheffield, and Lincolnshire Company at Retford, which was formerly their passenger station, is on the east of the joint passenger station which they now use in common with the Great Northern Company. Proceeding eastward from this goods yard towards the Clarborough Tunnel, there is first a falling gradient of 1 in 135 for 400 yards, then a level portion for 1,242 yards, then a rising gradient of 1 in 180 for 848 yards, then another level portion for 374 yards, and then a rising gradient of 1 in 120 for 1 mile and 616 yards.

The 4.15 p. m. fast passenger train from Manchester to New Holland left Sheffield at 6.38, eighteen minutes late, and Retford at 7.31, sixteen minutes late, on the day in question. It was composed of an engine and tender, five passenger carriages, and two break-vans, one before and the other behind the carriages. The engine-driver was warned by the locomotive foreman to "keep a good look out" in passing through the goods yards, but he was waved through that yard with a white light at each end of it, and he received no warning of any train being ahead of him. He was travelling at a speed of 25 miles an hour, up the gradient above referred to, of 1 in 120, and round a curve of perhaps half a mile radius, about two miles to the east of Retford, when he saw a red light in front of him. He thought at first that it was the distant-signal from the Clarborough Tunnel, and he shut off his steam and whistled for the guard's breaks. But he then came in sight of a bridge over the railway, and was thus made aware that he was upwards of a quarter of a mile from that signal and that the red light which he was immediately approaching must proceed from "something else." He reversed his engine and whistled again (he says) for the breaks, and he had reduced his speed to six miles an hour, according to his own account, or to 14 or 15 miles an hour in the opinion of the head-guard, when he struck a cattle-truck at the tail of a goods train.

The cattle-truck was crushed up; three of the beasts riding in it were killed, and two had their legs broken. The break-van in front of the cattle-truck was damaged, and the goods guard was thrown out and injured when about to jump out of it. Two of the passengers were slightly injured.

The head-guard, who rode in the last van of the passenger train, states that the train always slackens speed in ascending the gradient of 1 in 120 already referred to, and that he did not notice that the speed was reduced more than usual, until he suddenly felt a shock which knocked him back violently against the partition of his van and stunned him for a minute or two. He was standing up at the time, checking a handful of parcel-waybills, and he heard no whistle for the breaks. He looked at his watch when he had recovered himself, and he believes that the collision must have occurred at 7.39.

The assistant guard, who rode in the van next behind the tender, heard the engine-driver whistle for the breaks 200 or 300 yards before the collision occurred. He applied his break, and put the catch on it, and looked out as they struck the goods train. His head was thrown against the side of the window frame, but he was not much hurt.

The goods train was composed of a six-wheel-coupled goods engine, No. 110, twenty-eight loaded and two empty waggons, with two break-vans. It left Ardwick (near Manchester), 3 hours and 45 minutes late, at 10.5, the yard at that junction having been blocked up with goods trains; and it was further detained in shunting out of the way of passenger trains at different stations along the line. It reached Retford at 6.5, and left that station again after its work was completed, at 7.25 according to the engine-driver and guard, or 7.20 by the signalman's clock, 5 hours and 20 minutes late. The goods foreman had no watch or other means of ascertaining the time, except by asking the signalman or the gate-man, who are about 120 yards apart at opposite ends of the goods-yard; and he did not know the exact time at which the goods train started; but he allowed it to start, because he knew that the passenger train had been frequently late during the previous week or two, and because that train had not reached the Great Northern Station, at which it would remain 10 minutes.

The head goods-guard knew that the passenger train was due to leave Retford for New Holland at 7.15, and states that he asked the goods foreman whether he had not better shunt out of its way, and told him that he had rather do so; but the goods foreman said the goods train must go forward as there was no room to shunt it in the yard. The goods foreman denies that the guard said anything to him about shunting the train, but it appears that he could not even have found room for it on the other main line, and that it was a necessity, at all events, that it should go forward.

The sidings were occupied, the two goods lines were blocked up, and the other passenger line was already occupied by one coal train, which could not at that particular time have been set back across the Great Northern line.

In allowing the goods train to pass, the signalman observed, also, that the passenger train had not reached the Great Northern Station. He told the goods guard, in reply to a question, that it was overdue, and requested him to "put his best leg foremost."

The goods engine was a powerful one, with a cylinder $16\frac{1}{2}$ inches in diameter, and a stroke of 24 inches, working up to a pressure of 140 lbs. The six wheels, all coupled together, were $5' 3''$ in diameter. The rails were very slippery. The engine-driver states that he travelled for the first 1,650 yards at a speed of 14 or 15 miles an hour; that he ascended the gradient of 1 in 130 at 8 or 10 miles an hour; that he gained speed again upon the level, but that his engine began to slip on the gradient of 1 in 120, and that his speed was thus reduced to about 5 miles an hour. The head guard then began to sand the rails on one side while the fireman performed the

same duty on the other side, and the speed was increasing again when the collision occurred.

The goods train was then on the curve above referred to which runs through a cutting at this spot, and the view was further obstructed by the bridge over the line, which has also been mentioned. The engine-driver and fireman of the passenger train assert positively that only one lamp was visible to them in the first instance at the (right hand) side of the goods train, though the fireman saw a second lamp on the other side (as soon as his position on the curve admitted of it) before the collision. But they did not see any *tail* lamp, though the 2nd goods guard states that he had transferred his tail lamp from the back of his break-van to the cattle truck which was improperly placed behind it.

The principal causes of this accident are similar to the causes of other accidents on which it has been my duty recently to report on this railway. A heavy and unpunctual goods train was sent forward for want of siding accommodation in front of a fast passenger train, and in this case it was caught up before it could get under the protection of any fixed signals. The mere ten minutes interval of time between the two trains was lost in little more than two miles; and the fast train came upon the slow train at a part of the line on which its lights were only visible for about 230 yards.

Considerable improvement has been effected at Ardwick since the period when this train, in common with many others, was made so late in passing through that junction. But further accommodation for working the traffic is still much required on other parts of the

line as well as at the Retford goods yard. And, as I have pointed out in previous reports, the telegraph ought to be employed for the purpose of ensuring an interval of *space* between the trains. There are 12 passenger trains and 19 goods trains passing each way over the line east of Retford in the 24 hours, and though this traffic is light when compared with the traffic on the west of Retford, it is still of sufficient importance to make it exceedingly desirable that the employment of the telegraph should be extended. There are already telegraph-instruments in the office at the Retford goods yard, but the wires are so constantly occupied by other stations that there is great difficulty in using them for ascertaining when a passenger or other train is likely to arrive. In the present instance the goods train must have been starting from the goods yard as nearly as possible at the time that the passenger train was coming into the Great Northern Station. The trains are already telegraphed through the Claborough Tunnel, and it would be a great advantage if the block system there employed were extended, as might easily be done, into Retford.

It is a smaller defect, but not the less an important one, that the foreman in the goods yard should have no means of ascertaining the correct time. I recommend that a clock be placed in a conspicuous position in the Retford goods yard.

I have, &c.

H. W. TYLER,
Capt. R.E.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.

Board of Trade
(Railway Department),

SIR, Whitehall, 22nd December 1865.

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire [Lancashire and Yorkshire] Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the fatal accident which occurred at the Staleybridge joint station on the 2nd instant, and to request that my Lords may be informed of any steps which may be proposed to be taken for ensuring the safety of the public using the station.

I have, &c.

T. H. FARRER.

The Secretary of the
Manchester, Sheffield,
and Lincolnshire
Railway Company.

The Secretary of the
Lancashire and Yorkshire
Railway Company.

Board of Trade
(Railway Department),

SIR, Whitehall, 22nd December 1865.

WITH reference to the fatal accident at the Staleybridge joint station on the 2nd instant, to which you called attention in your letter of the 8th instant, I am directed by the Lords of the Committee of Privy Council for Trade to transmit to you the enclosed copy of the report made by Colonel Yolland, the officer who was appointed by my Lords to inquire into the circumstances connected with the accident in question.

Copies of the report will be forwarded this day to the "Manchester, Sheffield, and Lincolnshire" and "Lancashire and Yorkshire" Railway Companies.

I have, &c.

T. H. FARRER.

James Sidebottom Esq.,
Mayor of Staleybridge,
Town Hall,
Staleybridge.

Board of Trade
(Railway Department),

SIR, Whitehall, 16th December 1865.

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 11th instant, that I have inspected the Staleybridge station, and inquired into the particulars of the fatal accident which occurred there on the 2nd.

I was met at the railway station by the mayor and town clerk of Staleybridge and by the officers of the Manchester, Sheffield, and Lincolnshire, and Lancashire and Yorkshire Railway companies.

It appears that this station, when it was first opened in September 1846, formed a terminal station for the Manchester, Sheffield, and Lincolnshire Railway Company, both for goods and passengers, and two lines of way were laid down, of which only one was used for the passenger traffic which arrived at and departed from a single low platform 14 inches in height situated on the north side of the railway. Some time afterwards the Lancashire and Yorkshire Railway Company began to use this station as a terminal station for their passenger traffic; the London and North-Western Railway Company obtained Parliamentary powers for running over the Manchester, Sheffield, and Lincolnshire Railway at Staleybridge, for their Huddersfield

and Manchester branch which forms a continuation of the former from Staleybridge eastwards, and the passenger traffic was worked from this platform and a narrow platform between the rails for the London and North-Western Railway. About 6 years since, another platform was erected south of the railway and that between the lines removed, and another line of rails was added; this platform is 2 feet above the level of the rails, and on it there are booking offices and small waiting rooms, and this platform and the booking offices are now used for the trains of the three companies proceeding towards Manchester or Stockport. In order to do away with the necessity for passengers proceeding by trains in those directions or arriving at Staleybridge from Yorkshire by the London and North-Western trains, crossing the three lines of railway on the level, an approach to the south platform from a private road belonging to the Manchester, Sheffield, and Lincolnshire Railway Company passing through the coal yard below, was constructed up a long, narrow and steep flight of stone steps, 47 in number, which it is admitted by the railway authorities is but little used, and is certainly objectionable, and to elderly and infirm persons must be dangerous. This south platform is also very objectionable and dangerous, as it is only 6 feet wide for a length of about 71 feet, as it is at times crowded with people, as many as between 200 and 300 being booked to proceed by a single train, besides others waiting to proceed by other trains, and the steps for getting down off this platform in order to cross on the level to the north side are also dangerous.

No inspection by an officer of the Board of Trade appears to have been made of the alterations introduced about 6 years since, and if submitted they could not be allowed. There is a sufficient amount of platform accommodation on each side of the railway, but a great deficiency of shelter, and when the station ceased to be a terminal station for a single company, which at the present time only runs 13 in and 13 out passenger trains, with 3 goods trains in each direction, and was made to serve the purposes of a roadside station for the London and North-Western Railway Company, with 26 up and 27 down passenger trains, besides 24 goods trains in each direction, and also to be a terminal station for 12 in and 12 out passenger trains of the Lancashire and Yorkshire Railway Company, the station should have been carefully re-arranged in order to adapt it for the various kinds of traffic.

In reference to the accident which occurred at the station on the 2nd instant, I should state that it occurred to a passenger named Wright who had got out of a London and North-Western train from the east on to the platform at the south side of the railway, and he proceeded down the steps of this

platform and had walked across the three lines of railway, and was in the act of stepping up on to the low platform north of the railway, when he slipped down, and fell with his legs across the rail and his back against the steps, just as the Manchester, Sheffield, and Lincolnshire train due at Staleybridge at 8h. 48m. P. M., arrived at 8h. 55m. when the engine and tender and several carriages passed over and nearly cut off his legs. They were so much mutilated that they were obliged to be amputated, and he died of the shock to his system on the following evening. He was 78 years of age. He gave as his reason for crossing on the level, that he saw a boy cross, and thought he would do the same. He admitted to the station master that he had seen the Manchester, Sheffield, and Lincolnshire train coming in before he attempted to cross, and he would have succeeded in his attempt, if he had not accidentally slipped down. No servant of the company appears to have been aware of his intention to cross the rails on the level. The distance between the edges of the two platforms is about 32 feet.

The mayor of Staleybridge and the inhabitants of that town, which contains a population of about 25,000 persons, are anxious that the railway companies should construct an entirely new station on a different site, and I am informed that the subject has been under the consideration of the Directors of the Manchester, Sheffield, and Lincolnshire and the Lancashire and Yorkshire Railway Companies, and their respective engineers have been directed to prepare and submit a project on the subject; but there does not appear to be any immediate prospect of anything being done.

If the railway companies cannot determine to erect a new station, I would suggest the construction of an over bridge, so as to do away with any pretence for crossing on the level, and to raise the platform on the north side to the same level as that on the south side and thus remove the facilities for crossing; to remove the booking offices on the platform on the south side, and provide a platform with a clear width of about 12 feet, with proper shelter on both platforms.

This can be done on the ground now occupied by the present station without any necessity for acquiring more land, but it is questionable whether it would not eventually be more desirable to build another station.

Several other fatal accidents have occurred at this station, at the south platform, but they have all happened to persons when attempting to get out of trains before they have stopped.

I have, &c.

W. YOLLAND,

Colonel.

*The Secretary
Board of Trade,
Whitehall.*

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY.

*Board of Trade
(Railway Department),
19th January 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by their Lordships to enquire into the circumstances connected with the collision that occurred at the Woodhouse station on the 27th ultimo.

I have, &c.

W. D. FANE.

*The Secretary of the
Manchester, Sheffield, and
Lincolnshire Railway Company,
London Road, Manchester.*

SIR, 10, Abchurch Lane, London, 17th January 1866.

In compliance with the instructions contained in your Minute of the 1st instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 27th December last, at the Woodhouse station of the Manchester, Sheffield, and Lincolnshire Railway.

This station is on the west of the Woodhouse junction, and five miles east of Sheffield. The Midland Railway from Derby and Eckington, and the Birley (colliery) branch join the Manchester, Sheffield, and Lincolnshire Railway at this point. The line is level for about 1,000 yards in the station yard, but there is a falling gradient towards the station of 1 in 150 from the direction of Sheffield. There are main signals and distant signals for the Midland and Man-

chester, Sheffield, and Lincolnshire Railways, and there is a distant signal on the Birley branch. There are telegraph instruments towards Sheffield on one side and towards Retford on the other, but none towards Eckington. The accommodation for the signalman is of a wretched description. Besides others, there are two sidings north of the up line, which are called on the spot the *long* siding and the *back* siding. The former communicates with the down line, across the up line, by a pair of points 350 yards west of the junction cabin. The line curves considerably to the northward on the west of these points, and the view of an approaching train is much obstructed by the side of the cutting and by a bridge over the line 70 or 80 yards west of the points.

The 6.5 a.m. passenger train from Manchester to Hull and London approached Woodhouse at 9.14 on the morning in question, about 21 minutes late. It consisted of an engine and tender, 10 carriages, and 2 break-vans. The main signal and two distant signals were lowered for it to pass through the junction, and the engine-driver was travelling at a speed which he estimates at 10 or 12 miles an hour, but which was probably rather more, when he saw, in rounding the curve and nearing the over-bridge above referred to, some goods waggons on the up line in front of him. He reversed his engine, turned on his steam, and whistled for the breaks; but he was unable to avoid a collision with the last of these waggons, at a speed of perhaps 6 or 8 miles an hour.

The smoke-box door, the steam-pipe, the sand-box, the spring pillar, and one of the cylinder ends, as well as the buffers of his engine, were damaged. The waggon which was struck and that in front of it were turned over, and a pair of wheels was knocked from under each of them. One of the waggons grazed the sides of the passenger carriages, breaking a buffer-plank and a footstep of one of them. Ten of the passengers were injured, but none seriously.

The waggons which were thus in the way of the passenger train belonged to a goods train from Eckington, which had passed through the junction in the opposite direction at 9.11. This train was 3 hours and 6 minutes late, the Manchester, Sheffield, and Lincolnshire Company's engine having been kept waiting at Eckington for the Midland train to arrive. It was composed of an engine and tender, about 30 waggons, and a break-van; and it had 14 empty and 4 loaded coal waggons to leave in the *long* siding. The engine-driver drew forward on the down line on which he had arrived, to the west of the station. The portion of the train which was to go forward was uncoupled from the remainder, and left on the east of the siding points, while the other portion was taken to the west of the points. The guard unhooked some of the waggons which were to be left, and allowed them to run down across the up line, towards the *long* siding, and the *shunter* held the points which turned them across. They had nearly cleared the up line when the passenger train, appearing suddenly round the curve, came into collision with them as above described.

The engine-driver, goods guard, and shunter, were all prohibited by No. 19 of the Company's printed regulations from fouling the up line in this manner

while the signals were down for the approach of a train. The engine-driver excuses himself by saying that the bridge over the line, to which he was very near, prevented him from seeing either the distant signal or the passenger train, and that the main signal was at danger when he passed the junction. The goods guard makes a similar excuse, and states that he "took the shunter's word for being all right." The shunter denies that he spoke to the guard before the collision, but admits that he held the points to turn the train across. He had attempted to jump on the break-van from the platform as the train passed it, and had missed his footing, at the same time that he clung with his hands to the hand-rail of the van. He thus had a fall on the ballast which half stunned him, and he attributes his neglect in not looking at the distant signal before he turned the waggons across to this circumstance.

But further protection is urgently required for these points and this through crossing, especially as they are so situated behind an over bridge and on a curve. A second arm should be added to the furthest distant signal towards Sheffield, to be turned to danger by the shunter before the crossing is used; and he should have good means of communication, by bell-and-arm or otherwise, with the junction signalman, in order that they may apprise each other when the line is, or is to be, obstructed, and when it is clear. They communicate with each other at present, either by hand-signals, or by the signalman lowering the signals intended for the main line when he wishes to intimate that a train is not to leave a siding, or to shunt waggons across so as to obstruct it; or, in foggy weather, which frequently occurs in this neighbourhood, by the signalman's leaving his cabin and going to the shunter to give him verbal instructions.

I am happy to learn that great improvements are to be made at this junction. It appears to be the most important on this particular railway which has not yet been supplied with cover for the levers and locking apparatus. Higher main signals are required, and a higher and a more distant auxiliary signal towards Retford. The arm of the distant signal on the Birley branch can hardly be distinguished at present from the cabin, and main signals are required for that branch. A telegraph to the Midland line, as well as each way on the Sheffield line, would be an important auxiliary to the signalman. The instruments used for the Sheffield line, being inside his cabin while the levers are outside, are not easily attended to. Means of inter-communication are also required between the junction cabin and the sidings and cross-over road on the east of it.

Although I take the opportunity of calling attention to these various requirements, which should be satisfied with as little delay as possible, I may add, in conclusion, that the only one which had anything to do with the present collision, was the want of proper protection for and communication with the points and crossing at which it occurred.

I have, &c.

H. W. TYLER,

MIDLAND RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 31st August 1865.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Midland Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my

Lords to inquire into the circumstances connected with the collision that occurred on the 15th instant, at the Wellingbro' Station of the Midland Railway.

I am, &c.

The Secretary of the
Midland Railway Company.

W. D. FANE.

SIR,

Whitehall, 29th August 1865.

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 19th instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 15th instant, at Wellingbro' Station on the Midland Railway, between an excursion train and a portion of a goods train, when about 14 passengers were hurt, one of them seriously, but the remainder were not much injured.

An up special goods train from Leicester to London reached Wellingbro' Station, which is about 16 miles north of Bedford, about 10.10 p.m., and a portion of the waggons were at once placed in the up sidings lying north of the station, and east of the main lines, and nearly filled them. After the down mail train had left at 10.40 p.m. the remainder of the train was shunted from the up across the down road, into the down siding lying west of the main line, and as the whole of the remaining waggons could not then be got into this siding without fouling the down line, the engine was uncoupled, passed by a cross over road and along the down line to the north end of the siding which joins the down line near the south end of the down platform, and was then hooked on to the waggons, drew them ahead, so as to be clear of the points, and then shunted them back along the down siding parallel to the down line.

There happened to be one waggon of goods intended for London between the engine and the break van, and the guard of the goods train said that he would take these out on to the main down line, shunt the break van on to the down main line, and then place the goods waggon next to the other waggons in the down sidings, and the signalman who was then in sole charge of the station allowed him to do as he proposed about 10.49 p.m., somewhere about four minutes before the time at which an excursion train from Burton to London was due to pass Wellingbro' Station without stopping, on its return journey to Burton.

One of the Company's rules directs that the main lines are, if possible, to be clear of all obstructions 10 minutes before the time at which any train is due to arrive at a station. In this instance, it was quite possible to have kept the down line clear, and the signalman admits that he was to blame for having allowed the goods engine, break van, and waggon to be brought out on to the main down line. I did not see the goods guard, as he had been discharged, but he must be considered as equally to blame with the signalman for having so unnecessarily broken one of the rules.

As soon as the goods engine, waggon, and break van had got out on to the main down line, the Burton excursion train was seen to be rapidly approaching, and it ran into the portion of the goods train then on the down line, smashing up the goods waggon, overturning and damaging the break van, at a speed which is variously stated by the different witnesses at from 8 to 20 miles an hour. The engine of the excursion train had its buffers broken, one of the taps of the steam chest knocked off, and the life guards bent, but it was not thrown off the rails, and none of the passenger carriages were damaged or thrown off the line.

Wellingbro' Station is situated on a curve in the line, and at the foot of two inclines. It is protected by the usual semaphore station signals, and by a distant disc signal about 670 yards south of the station signal, which can be first seen from the engine of a down train about a quarter of a mile from the signal, but the view is slightly interfered with by some bushes. The semaphore station signal is first seen opposite to the Gate House of a road crossing, 950

yards distant from the signal, but the view of it is a good deal interfered with by trees, until the distant signal is reached, and again by the water tank for a distance of 70 yards after the distant signal is passed.

There is conclusive evidence to prove that both the station and distant signals were at danger, and that the lamps, which were of gas, were burning, although the driver and fireman of the excursion train engine state that they were both looking for the distant signal and could not see it.

They admit that they did not see the station signal at the place where it first comes in sight, and that when they did see it, it was at "danger." The engine driver states that when he came round the curve by the Gate House he sounded the whistle once, and when he could not see the distant signal he shut off the steam, but did not cause the tender break to be put on, until he saw the station signal at danger, and very nearly at the same time he saw a train standing at the station. He then put the break on, and sounded the whistle for the guards breaks, reversed the engine and put on the steam the reverse way.

He thinks he was running 30 miles an hour when he passed the Gate House, but some of the other witnesses estimate the speed at 35 or 36 miles an hour.

I gather from the statements of the various witnesses that the driver and fireman took no effective steps to stop their train until they had passed inside the distant signal and were within about 500 yards of the station signal, and the place where the collision occurred.

The train consisted of engine and tender, 13 carriages and 2 break vans, with a guard in each, at the two extremities of the train. It contained about 300 passengers, and it might, at very moderate cost, have been provided with continuous breaks at each extremity of the train that would have enabled it to be stopped without any collision, notwithstanding the fact of the driver and fireman having failed to observe the signals at a greater distance from the station.

I have thus shown that the collision would not have taken place if the guard of the goods train or the signalman at the station had done their duty, and it is further apparent that it would not have happened if the driver and fireman of the excursion train had kept a good look out, or if the train had been furnished with continuous breaks at the extremities of the train notwithstanding their neglect.

But it appears that the engine driver and fireman left their homes at 2.30 a.m. They got to London at 9.50 a.m., amused themselves during the day in London, and about 10.50 p.m., 20 hours after they left their homes in the morning, they omitted, when running to their proper time, and when the station at Wellingbro' should have been clear for them to run through it without stopping, to keep a sharp look out and to observe the station and distant signals as soon as they might have done.

I do not think it all surprising, under the circumstances, that this should have happened, and consider that this mode of working excursion traffic is very objectionable, and well calculated to endanger the lives of those travelling in such trains.

It is quite true that the engine driver was not on duty on the previous day, and that the fireman only had an ordinary day's duty, and both might have gone to bed some time after they got to London in the morning, but it could not be expected that they would do so.

It would be very desirable to improve the view of the Wellingbro' signals, when approaching the station from the south.

MIDLAND RAILWAY.

*Board of Trade
(Railway Department),*

SIR,

Whitchall, 21st December, 1865.

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, in order that the same may be laid before the Directors of the Midland Railway Company, the enclosed copy of the report made by Captain Tyler, R. E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the 13th ultimo between a mail passenger train and a goods engine near Sheffield.

I am, &c.

J. E. TENNENT.

*The Secretary of the
Midland
Railway Company.*

SIR,

Wakefield, 15th December, 1865.

IN compliance with the instructions contained in your minute of the 29th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 13th ultimo, near Sheffield, on the Midland Railway, between a mail passenger train and a goods engine.

The 3.20 A.M. goods train from Masborough to Sheffield left the former station at 3.40 A.M. on the morning in question, consisting of an engine (No. 178) and tender, 35 waggons loaded with iron, lime, and goods, and a break-van. The engine had its six wheels all coupled together, and is stated to have been in good working order; its cylinders were 16 inches in diameter, with a stroke of two feet; its wheels were five feet in diameter, and it was working at its full pressure of 140 lbs. of steam; but the morning was foggy and frosty, and the rails were very slippery. Although the load was not an unusual one, the engine began to slip at half a mile from Masborough, and after travelling very slowly for $2\frac{3}{4}$ miles further the train came to a stand.

The guard, who had followed it on foot for the whole of that distance, then went back to the Blackburn Junction, which is about $2\frac{1}{2}$ miles from Sheffield and $2\frac{3}{4}$ miles from Masborough, and requested the signalman to stop the mail train. As soon as that train arrived the goods guard joined it, and he rode on the engine up to the tail of his own train. He then left the mail engine to push behind, while he went forward to the goods engine to assist in throwing ballast on the rails. The two trains proceeded together in this manner for about a mile, and then came to a stand at 5.5 A.M., a mile from Sheffield, unable to go further. As a last effort, the mail train was got clear of a cross-over road which afforded the means of transferring it from the east to the west line of rails.

The goods-guard proceeded next to make his arrangements for taking the mail train along the *wrong* line into Sheffield. He communicated his intention to the passenger engine-driver, and told him to get his train across, and also to the signalman at what is called the "east end engine-shed crossing." He went forward to the goods engine, uncoupled it from the train, and proceeded with it towards Sheffield. He told the pointsman at the "Bell box," near the Sheffield platform, to let nothing pass, as he was going to pilot the mail down the wrong road; he said the same thing to the pointsman at the "Elevated box," half a mile from the Sheffield station, and he went forward with the goods engine towards the passenger train, to "pilot it," as he had intended to explain, down the wrong line.

When he had gone about 200 yards beyond the "Elevated" box, or less than three quarters of a mile from the Sheffield station, he met the mail train coming along the same line of rails in the opposite direction. The engine of that train came into collision with the tender of the goods engine at speeds which are stated to have been from three to five miles an hour. The engine drivers were unable to see each other for more than "10 yards" for the fog. The buffer-plank of the goods tender was broken and the tank was bulged in. The buffer-plank of the passenger engine was also broken, and the engine framing was strained. Two of the passengers in the mail train have complained of injury.

The mail train had previously left Masborough punctually at 4.30 A.M. for Sheffield, consisting of an engine and tender, and four carriages, of which two were break carriages. The engine-driver ran over several fog signals before he reached the Blackburn Junction, and having been joined by the guard of the goods train he assisted in pushing that train forward for a mile, as I have already described. He understood when the goods guard left him, after they finally came to a stand, that the goods guard was going to precede him to the "Elevated box," in order that no engine or train might come in the opposite direction; and he explained this arrangement to his own guard, who joined him shortly afterwards. They determined to wait for five or six minutes to give the goods-guard time to make the line safe for them, and they then crossed over to the *wrong* line and proceeded along that line towards Sheffield as they understood that they were intended to do.

The pointsman at the cross-over road took the same view of the goods guard's meaning, and thought he had gone "forward with a signal." He therefore turned the mail train across, and allowed it to proceed along the wrong line towards Sheffield.

The collision was therefore caused by a misunderstanding on the part of the engine-driver of the mail train and of the pointsman, as to the intention of the goods guard; and a reference to the company's book of printed regulations affords a key to this misunderstanding.

No. 19 of those regulations lays down a mode of working by a pilot guard, which is to be put in force "when an accident occurs on any part of the line," and when, one line being obstructed, arrangements may be made "to run the train on the line which is clear." Under this regulation, to avoid two trains meeting, a person must be appointed as pilot-guard to "ride on every engine which passes along the single line of rails" and "no engine is to pass on the single line at either end unless the pilot-guard is present and riding upon the said engine, unless two trains are required to follow in the same direction, in which case the pilot-guard must order the first train to proceed whilst he waits until the next engine arrives upon which he must ride, &c., &c."

No. 23 of those regulations directs that "when an engine shall be obliged to move in the *wrong* direction on either line" the guard or other competent person shall go with a signal "one mile in advance of the engine, to stop any engine or train coming on the same line in the opposite direction; and whilst moving, the engine-man shall make frequent use of the whistle, and shall not run at a speed exceeding four miles an hour, so as to enable the person sent in advance to keep one mile before the engine."

The goods-guard intended evidently to work under the former, while the engine-driver of the mail train and the pointsman believed that he would work, and acted themselves as if guided by the latter of these regulations. It would be better if, after the ex-

perience of the present accident, these regulations were revised; if it were more clearly laid down in what cases precisely each method should be adopted; and if, before working on the wrong line, or, which is virtually the same thing, temporarily on a single line, written instructions were required to be handed by the guard or other person initiating the system to

the engine-drivers and pointsmen at either end of the portion of railway so worked over.

*The Secretary to the
Board of Trade,
Whitehall.*

I have, &c.

H. W. TYLER,
Capt. R.E.

MIDLAND GREAT WESTERN (OF IRELAND) RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 22nd December 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Midland Great Western (of Ireland) Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords inquire into the circumstances connected with the collision that occurred near Kilcock Station on the 7th October. last.

I am, &c.

*The Secretary of the
Midland Great Western
(of Ireland)
Railway Company.* T. H. FARRER.

SIR, *Portarlington, 14th December 1865.*

IN compliance with your minute of the 27th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances that attended the collision, that took place on the 7th October 1865, between Maynooth and Kilcock stations, on the Midland Great Western Railway of Ireland.

Twelve persons are reported to have been injured, but none of them severely.

Seven of the above are workmen in the Company's employment. Four of them and one of the passengers leaped out of the carriage they were travelling in on perceiving that a collision was going to take place.

A train, consisting of an engine and tender, 7 trucks loaded with coals, twenty-one empty waggons, and a guard's break van, with a guard in it, left Broadstone station, Dublin, at 7 A.M. on the 7th October 1865. It stopped at Kilcock station at 8.20 A.M. The station master unhooked the engine, so that the driver might fetch three empty waggons from the up line and take them on with his train.

The guard states, that after screwing on his break, he came to the front of his train and directed the driver to put back again, so that he might hook on the seven coal waggons that the station master had unhooked, and by that means, get the empties (that were to be taken from Kilcock,) placed in rear of the coal waggons.

The driver did put back; the coal waggons were hooked on, and then the driver got off his engine to oil it. While he was doing this, the guard unhooked the 21 empties which were behind the coal trucks.

The driver, on remounting his engine, did not observe that the empties had already been unhooked and he eased his engine back, to facilitate the work of unhooking.

In doing so, he appears to have given the 21 empty waggons which were then standing loose, a slight push which started them. The motion was so slight at first, that neither the driver, nor the guard who was already about half way between the end of the coal trucks and the engine, perceived them move.

Kilcock station is at the summit of an incline.

The line from the east end of the station for the first 500 feet towards Dublin falls, on gradients of 1 in 900 and 1 in 300. It then falls, for about $\frac{1}{4}$ of a mile, on gradients of 1 in 100, 1 in 108, and 1 in 120.

The engine of the goods train stood near the cross-

over road, at the east end of the station. The engine, tender, and most of the waggons, occupied a length of 500 feet, where the gradient was only 1 in 900 and 1 in 300, but the van and probably one or two waggons, stood on the incline of 1 in 100.

The weight of the coal waggons in front, and the number of empties standing on the flat portion of the line, would prevent the train from running back, (even if the guard neglected to put on his break) so long as it was not disturbed. The break was found completely off, after the accident, and there is no doubt that the guard forgot to screw it on, before leaving his van. The push backwards, given by the engine driver, after the coal waggons were detached, appears to have started the empties. They ran down the incline which extends for $\frac{3}{4}$ of a mile towards Maynooth, and had gone about $\frac{1}{2}$ a mile further on the level towards that station, when a passenger train which left Dublin at 7.30 A.M. and Maynooth at 8.38 A.M. ran into them as it came round a curve.

A slight injury to the buffer plank of the engine was the only damage done to the passenger train, which consisted of a tank-engine, weighing about 13 tons, a third class, two composite carriages and a guard's van, with a guard, at the tail of the train.

The driver and fireman jumped off just before the collision.

The guard's van at the tail of the goods train, which came into collision with the engine of the passenger train, was knocked off the rails and the buffers were broken.

The empty waggon next to the van, mounted the waggon in front of it, but its rear wheels remained on the rails. No further damage was done.

The engine belonging to the goods train, followed the run away waggons as soon as possible, and came up shortly after the collision.

The driver of the passenger train had got about $2\frac{1}{2}$ miles from Maynooth when he perceived the empties. The railway at this point, curves to the left, and there is a farmyard with hay stacks in the bend, which somewhat impedes the view.

The driver at first supposed the empties, to be a ballast train on the up line. He considers that he was running at a speed of about 35 miles per hour, and had got within 200 yards of the empties, when he found that they were coming towards him on the down line, on which he was travelling. He reversed his engine, whistled so loudly for the breaks, that he alarmed the persons in the train, several of whom jumped out. He thinks that he had reduced his speed to about 12 miles an hour, when he struck the van attached to the empty waggons.

The accident was caused no doubt, by the guard of the goods train, neglecting to put on his break, when he stopped at Kilcock station.

It would be desirable that the breaks of all waggons standing on an incline of the kind should be put on, when the engine is detached and shunting takes place. I would further suggest the desirability of putting throw off points, on the down line, at such a distance from the station, as to be outside the last vehicle of the longest train. They should be loaded so as to stand open for the siding, to catch any vehicles that may break away.

I have, &c.

*The Secretary of the
Board of Trade,
Whitehall.*

F. W. RICH,
Capt. R.E.

NORTH BRITISH RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 12th Dec. 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you to be laid before the Directors of the North British Railway Company, the enclosed copies of the Reports made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collisions that occurred on the 18th and 29th ultimo, at the Heiton goods siding on the North British Railway between Roxburgh and Kelso stations.

I am, &c.

J. EMERSON TENNENT.

*The Secretary of the
North British
Railway Company.*

SIR,

Dublin, 9th Dec. 1865.

IN compliance with the instructions contained in your minute of the 29th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision, that occurred on the 18th ultimo, between Roxburgh and Kelso station, on the North British Railway.

About half a mile east of Roxburgh station there is a goods station named Heiton. The sidings were placed there, to receive the goods from the district, on the east side of the Teviot River, as there is no bridge over the Teviot at this place, by which they might be taken to Roxburgh station, and Kelso station is two and half miles east of Heiton sidings.

The sidings are in charge of a man who acts as signalman and goods porter, and is also required to collect the unpaid accounts belonging to his station. He is provided with distant signals on each side to protect his station.

On the 18th November a special goods train, consisting of an engine and tender, nine loaded waggons, and a break van and guard at the tail of the train, stopped at Roxburgh station on its way to Kelso, at 5.47 p.m. Two of the waggons of this train were to be left at Heiton sidings.

The train was started from Roxburgh at 5.58 p.m. by the station master, who states, that he gave distinct orders to the guard of the goods train, to shunt his train, clear of the main down line at Heiton.

The signalman at Roxburgh heard the station master give these orders to the guard of the goods train. The latter did not come before me as he had only just been released on bail, and did not wish to give me his evidence.

When the special goods train arrived at Heiton, the signal porter (who is also on bail and did not appear before me) was absent from his post.

It is stated that he was collecting some accounts, which had been given to him that day for collection by the station master at Roxburgh.

The guard of the special goods train, instead of attending to the orders he is said to have received from the station master at Roxburgh, unhooked the engine and three front waggons of the special goods train and held the points for the driver to take these waggons across, and leave two of them in the goods sidings. Six loaded waggons were left on the main down line, and the guard, in direct disobedience of the regulations of the North British Railway Company, also neglected to turn on the distant signal to protect this train.

A passenger train, consisting of a tank engine, a horse-box, a second-class carriage with break compartment, one first-class, one third-class carriage, and a break-van with a guard in it, left St. Boswell's at 5.50 p.m. It was 19 minutes late. It left Roxburgh on its way to Kelso at 6.13 p.m., 19 minutes late. The line from Roxburgh to Heiton falls on a gradient of 1 in 100, and the train had attained a speed of 18 or 20 miles an hour on reaching the Heiton distant signal which denoted all right. The driver of the passenger train perceived the lamps on the van at the tail of the goods train, which was standing on the down line in front of him; but Heiton sidings are situated on a curve, and he did not think, and could not know, that the van was on the same line of rails that he was travelling on till he got within 70 or 80 yards of it.

As soon as he did, he told the fireman to put on the breaks, and he reversed his engine and shut off steam; the fireman and driver then prepared to jump off, which they did just before striking the guard's van. The driver states, that he had no time to whistle for the guard's break or to put on steam after reversing the engine.

His shoulder bone was broken, and his fireman's arm was strained. Eleven passengers were more or less cut and bruised. The Rev. W. Gordon received a severe blow on the head, and the guard was knocked down amongst the luggage, got a severe blow on the head and several bruises. The speed of the passenger train appears to have been hardly reduced at all before the collision took place. Neither the engine or any of the carriages left the rails, but the tank, the fender guards, and hind buffers of the passenger train engine were broken, and the buffers and inside framing of the carriages were damaged. The couplings between the first and third-class carriages were also broken.

The van of the special goods train and three of the waggons were broken to pieces, and a fourth was slightly damaged and knocked off the rails.

The permanent way is stated to have been slightly injured.

Though the position of the signals at Heiton siding had nothing to do with the accident, I would suggest that they be placed at a greater distance from the sidings, so that they shall be well seen by the drivers of trains as well as by the man working them.

The approach to Heiton from Kelso is on a falling gradient of 1 in 135, and from Roxburgh it is on a falling gradient of 1 in 100.

If the North British Railway Company could do away with these sidings it would be an advantage, as detached mineral or goods sidings, left in charge of an ordinary porter or depending on the train guards, to work the signals, are always more or less sources of danger.

A second accident of a similar kind, which I have also inquired into and reported on, occurred at these same sidings on the 29th November.

The collision of the 18th ultimo was caused by the guard of the special goods train leaving a part of his train on the main line, in direct disobedience of the orders of the station agent at Roxburgh, and by his not putting on the signals to protect his train in accordance with the regulations of the North British Railway Company, when he found that the signal porter belonging to Heiton sidings was absent from his post.

I have, &c.

F. H. RICH,

Capt. R.E.

*The Secretary
Board of Trade,
(Railway Department).*

NORTH BRITISH RAILWAY.

*Board of Trade
(Railway Department),
Dublin, 9th December, 1865.*

SIR,

WITH reference to your Minute of the 29th ultimo, directing me to report on a collision that occurred on the 18th ultimo, near Roxburgh, on the North British Railway, I have the honour to submit, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances that attended a collision of a similar kind, that occurred at the same place, (Heiton goods siding) on the 29th ultimo.

The only differences between the collisions that took place at Heiton on the 18th and again on the 29th ultimo, are, that on the 18th ultimo the signals were not put on to protect the goods train standing on the main line, and on the 29th ultimo the driver of a passenger train who following a goods train neglected to observe the signal in proper time, which was put on to protect the goods train that preceded him, and which had been stopped at these sidings.

On the 18th ultimo the two trains were proceeding from Roxburgh to Kelso. None of the vehicles in the passenger train left the rails, but several passengers were injured. On the 29th ultimo the trains were proceeding from Kelso to Roxburgh, the engine and all the passenger carriages but the last left the rails, and only one passenger is reported to have been injured. He received a bruise on his leg and a cut on his forehead.

On the 29th ultimo, a special goods train was started from Kelso at 7.10 p.m. for Edinburgh.

It consisted of an engine and tender, 14 full and five empty waggons, with a guard's van and guard at the end of the train.

When started from Kelso it was not intended to stop at Heiton, but the signal porter in charge of the sidings stopped the train by his signal, as he required four empty waggons from it. The goods train had been about 19 minutes in travelling the two and a half miles from Kelso to Heiton, as the inclines are steep, and the rails were greasy from rain; a minute or two was lost by the driver and guard wishing to take on the empty waggons to Dalkeith and not consenting to leave them at Heiton, till the signal porter insisted on having them and would not give the driver the all right signal to go on.

The guard's van had been uncoupled and the driver of the goods train had got the signal to pull up his train, and was about putting the empties into the sidings when he heard the passenger train coming. The driver commenced to move forward again, when he heard the passenger train coming, but he had barely got under way, when the passenger train came into collision with the guard's van which had been uncoupled, broke it to pieces, and drove it forward on to the waggons at the end of the goods train, four of which were broken to pieces.

The passenger train left Kelso at its proper time, 7.25 p.m. It consisted of an engine and tender, a guard's van, one third, one first, and one second class carriage with a break compartment in which the guard rode.

They were coupled in the order given.

The driver of the passenger train is out on bail and did not give me his evidence, but his fireman stated

that he was perfectly aware that the goods train had started 15 minutes before, but that he believed that it was not going to stop at Heiton.

According to the North British Railway Company's time tables, the 7.15 p.m. passenger train is allowed nine minutes for the three miles between Kelso and Roxburgh, which gives an average speed of 20 miles per hour, but the first three quarters of a mile out of Kelso is up a steep incline of 1 in 70, and the fireman stated that they travelled up this incline at a speed of about 10 miles an hour.

According to the several witnesses, the passenger train came into collision with the goods train at Heiton, which is two and a half miles from Kelso, about seven or eight minutes after leaving Kelso. The speed from the top of the incline to Heiton was probably not less than 25 miles per hour. From the evidence of the fireman (who was engaged in taking up the clothes box which had fallen amongst the coals in the tender, when the driver called to him to hold on,) the driver of the passenger train does not appear to have noticed the Heiton distant signal till he got close up to it, even if he did so then. He reversed his engine, but does not seem to have whistled for the guard's breaks and ran into the van, which had been uncoupled from the goods train, and which had lights attached to it, at a speed of 12 to 15 miles an hour.

The passenger engine, and all the carriages except the last, were thrown off the rails. The engine No. 18 had her framing bent. The eccentric straps and buffer planks were broken, and most of the gearing was bent, probably in consequence of one of the pairs of wheels of the van which the engine struck, getting underneath the engine.

The van next to the engine had one spring and the break screw broken.

The distant signal on the Kelso side of Heiton sidings is about 270 yards distant from the sidings. It can be seen for more than half a mile before reaching it, but the line is on a falling gradient of 1 in 135, and most of the evidence is to the effect, that the night was foggy and that the signal could not be seen for any great distance. I am inclined not to put much faith in this evidence, which is decidedly contradicted by the signalman at Heiton sidings, and is borne out by the fact that he did stop the special goods train by the said signals, although the driver was rather unwilling to be stopped.

The goods train, moreover, was a heavy train of 14 full and five empty waggons, with only one break, whereas the passenger train consisted of only three carriages and a break van, and could no doubt have been stopped in proper time had the driver been looking out for the signals.

I consider that the collision at Heiton on the North British Railway, which occurred on the 29th ultimo, was caused by gross neglect on the part of the driver of the passenger train, who no doubt believed that the goods train was not going to stop at Heiton, and failed to keep any look out for the signals.

I have, &c.

F. H. RICH,
Capt. R.F.

*To the Secretary
Railway Department,
Board of Trade.*

NORTH-EASTERN RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 13th September 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North-Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred at the Malton Station, on the 5th ultimo.

My Lords trust that Captain Rich's recommendations will receive the careful consideration of the Directors.

I am, &c.

W. D. FANE.

*The Secretary of the
North-Eastern
Railway Company,
York.*

SIR, *Whitehall, 1st September 1865.*

IN compliance with your minute of the 12th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances that attended the collision that occurred on the 5th ultimo at Malton Station on the North-Eastern Railway.

No passengers are reported to have been injured.

As this collision appears to have been caused by the improper system of signalling at Malton and the want of a proper signalman to perform the duties, I would first submit the signalman's evidence as to the daily duties he is appointed to perform.

Thomas Brigham, who is charged with the duties of signalman at Malton (which is rated as a first-class station in the book of regulations of the North-Eastern Railway), is a young man who has been 19 months in the Company's service, and has been signalman for one month. He stated: "My duties are, to sweep out a train at 6 a.m.; I then fetch the lamp from York back signal; I then look to the water closets and clean them. After breakfast I attend the signals. I attend as porter to all passenger trains. When the 10.10 a.m. train to York goes through I have to go and clean and wash a Driffield train; between 11 and 12 I come to the signals again; I then have the shunting of the Driffield train at 11.50 a.m. I attend to my signals till 1 p.m., when some of the porters come back, and I am released till 2 p.m. I then take charge of the signals again till the expresses pass from York and Scarborough. I then clean out and couple up the Driffield train for shunting, and shunt her out for half-past four. I then take charge of the signals for the night by lighting the signal lamps. I then leave, after the last train passes from York at about 8 p.m. I am supposed to work the signals for the goods trains, but if I am away at other work they come in without the signals being lowered. I am often away from the signals when I should be at them." Thomas Brigham received 17s. per week for the performance of these many duties and for attending 15 hours in the day.

There are 19 up and 19 down passenger trains and 15 goods trains up and 15 down, which pass through Malton daily, besides special trains, for which the regulations provide, as follows; for the North-Eastern Railway in general, "but it will frequently happen that special trains not in the time bills, requiring special attention, will be dispatched without previous notice; it is therefore necessary to be at all times prepared for unexpected trains."

The preparation as regards a signalman at Malton being altogether insufficient for the working of the station, a system of hand signals (which appear to have been given by any one in the yard who would afford assistance in that way) was consequently adopted.

Moreover, these hand signals were not given with a flag, as is usually the case with hand signals, but merely by the action of the hand.

On the 5th August, about 6.25 p.m., No. 332 engine, which had got off the rails to the eastward of Malton, whilst drawing a goods train, returned to Malton with two tool vans. The locomotive foreman, who went from York with another engine to assist in getting No. 332 on the rails, returned to Malton with her, having forwarded the goods train with the engine he brought from York.

The driver of No. 332, entered Malton Station against the station signal, as the signalman was not at his post and did not see the engine come in. The engine was brought to a stand on the up line, at about 20 yards on the Scarborough side of the station signal, behind some empty coal waggons. A hand signal was given by some person near the engine shed at the other end of the yard for 332 engine to push up the coal waggons, and immediately afterwards a second hand signal was given by another person to stop. These persons are said to have been the foreman of the yard and a boy at the points.

Next the station master appeared at the west end of the ticket platform near the engine shed, signalling with his hand.

The driver, the fireman, and the locomotive foreman, who were on No. 332 engine, all thought that the station master's signal was meant for them, and the driver supposed that he was intended to move across to the down line and pass through the station on that line towards York, instead of on the up line, which was blocked. He states that he was in the habit of doing this, and he is borne out in this assertion by the signalman, who states that it was the daily practice with the Driffield trains; and by the station master, who admits that when the up line and sidings on the south side were blocked the down line through the station was used by up trains.

At the time that the driver of 332 took the station master's hand signal to move across to the down line the signalman, whose post is at the east end of the station, had left it and gone half way down the platform to look whether the line was clear for the down express that was overdue. He was aware that a Scarborough goods train was shunting in the yard on the York or west side of the station, and as the curve of the line coming into Malton Station from York prevented his being able to see what was going on at the west side, he ran down the platform to get a view. He stated: "The distant signal, York side, was not on against the express. I had just nicely got it pulled off before the driver of the express whistled; but I ran out to the platform to get a signal that the down line was clear from shunting, which I knew was going on in the yard, before lowering my station signal."

His ignorance of the duties of a signalman is shown by his lowering the distant signal when he knew that shunting had been going on and did not know that the line was clear, though he shows a partial knowledge of the use of the signals by his keeping the station signal on till he was satisfied that the line was clear.

Whilst on the platform, looking out with this object, he perceived the station master at the far end of the ticket platform, signalling to him with his hand, and he was correct in thinking that this hand signal was intended for him to lower the station signal for the express, which was then inside the distant signal

He did so, and then perceived that the vans which were attached to No. 332 engine were foul of the down line on which the express was travelling. He called to the guard of the express to put on the breaks, and the driver of the express reversed his engine, but there was not sufficient distance for them to stop the train. The express, consisting of an engine and tender, a guard's van, a second-class, two first-class, a second-class carriage, and a guard's van, coupled in the order given, left York on the 5th August, at 5.40 p.m. It was about seven minutes late at Malton.

The distant signal at that station was taken off as the train came up, but fortunately the station signal was on, so that the speed of the train was checked to about 14 miles per hour after passing the distant signal. The station signal was taken off when the express was about half way between the distant signal and the station, and the express ran through the station at about 12 miles per hour with steam shut off.

On emerging from the station, the driver perceived an engine pushing two waggons from a cross-over road on to the down line on which he was travelling. He reversed his engine; the breaks were applied, and the speed reduced to about 10 miles per hour; but the distance was too short to prevent a collision, and the engine of the express train, struck No. 332, (which was pushing the waggon) on the off side, at the front spring. Fortunately, No. 332 engine was travelling backwards, pushing the waggons behind it, in the same direction in which the express was travelling. The front wheels of 332 were knocked off the rails; her buffer plank, foot plates, side rods, and one axle box were broken. The express engine was thrown off the rails; her buffer plank, one of the stays, and her leading axle box were broken. The driver and fireman were a little shaken, but not hurt.

Malton Station is on a curve, and has about a quarter of a mile of sidings at each end of the station. There are numerous pairs of points at each side of the station, connecting the sidings with the main up and down lines. It is protected with distant and

station signals, but owing to an engine shed and some trees, the station signal is not seen for the whole distance from the auxiliary signal, when approaching the station from York. The position of the station signals is such that the man in charge cannot see from his post what is going on at the sidings and in the goods yard to the west of the station, and there is no box for the man in charge to remain in.

It would be desirable to have one siding at each side of the station which would connect all the other sidings with the main lines, afford the means of controlling them with proper signals, and of keeping the main up and down lines clear for the traffic, instead of allowing the up trains to pass through the station on the down line, which appears to be the constant practice at present. The signalman should be placed in a properly elevated box, from whence he could command a good view of the whole station; and a proper signalman should be appointed.

Thomas Brigham appears to be quite unfit for such responsible duties. Hand signals, where absolutely necessary, should be given with a proper flag and by a man specially appointed for the purpose.

Malton appears to be one of those stations which has grown in importance since the line was opened. The arrangement of the sidings and signals for working the station appear to be inadequate to its requirements, and to have led to the adoption of indiscriminate hand signalling, which caused the collision that took place on the 5th inst.

The passengers in the express and the workmen in the vans had a great escape. I strongly recommend the North-Eastern Railway Company to make better arrangements, and appoint a proper signalman at Malton, as well as at all other stations belonging to them which are worked in a similar manner.

I have, &c.

F. H. RICH,
Capt. R.E.

NORTH-EASTERN RAILWAY.

*The Board Trade
(Railway Department),
Whitehall, 10th October 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North-Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred between a passenger train and a goods engine at the Newcastle central station on the 8th ultimo; and to express the hope of their Lordships, that the Directors will give their careful consideration to the recommendations contained in the report.

I have, &c.

W. D. FANE.

*The Secretary of the
North-Eastern
Railway Company.*

*Board of Trade
(Railway Department),
Whitehall, 5th October 1865.*

SIR,

I HAVE the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, that in compliance with your minute of the 11th ultimo I have inquired into the circumstances connected with the collision that occurred on the 8th September 1865, at Newcastle central station on the North-Eastern Railway.

The causes that led to the accident are very similar to those that led to the collision at Malton station, on which I reported a short time since, viz., an inexperienced signalman, unfit for the duties he was

required to perform, and an arrangement of points and signals (necessarily complicated, from the great traffic into the station), to which none of the modern improvements have been applied.

The trains from Sunderland and the south enter the central station at Newcastle by the high level bridge, on which there are three lines of rails, two for passengers and one for goods. The main lines from the north join the lines from the south at the north end of the bridge. There is a raised hut, No. 1, close to the north end of the bridge, for a signalman to look out for trains approaching the junction, as they cannot be seen from hut No. 2, which is about 50 yards distant from No. 1, and opposite the points of junction.

The men in huts Nos. 1 and 2 work in connexion with each other, each having a certain number of signals and points connected with the junction under their immediate control.

There is a third hut, about 80 yards nearer to the station, where the points leading to the several lines and platforms in the station are worked. The man in charge of No. 3 also works in connection with the man in No. 2 hut.

The man in No. 2 hut has six pairs of points and four signals in his charge, and has to look to the men in No. 1 and No. 3 huts for signals that they may give in connexion with approaching trains.

From 200 to 260 trains pass his box each day. On the 7th ultimo the signalman belonging to No. 2 hut had obtained three days leave of absence, and the permanent way inspector was required to supply a platelayer to do his duty.

The permanent way inspector was perfectly aware

of the responsibilities of the station he was required to supply a man for. He selected Thomas Turnbull, who is 22 years of age, and whose first employment on railways commenced about 10 months before with the North-Eastern Railway Company.

He had been employed as platelayer in the yard since May last, and had had a fortnight's training in No. 2 hut.

On the 8th ult. an engine with two goods trucks was sent from the Manor to the Carlisle station at Newcastle. It had to pass the junction at the north end of the high level bridge.

The signalman at No. 2 hut allowed it to pass through the junction and across the main line to the goods sidings, by a pair of points worked from his box.

In doing so he hooked the points over, instead of letting them fall back and shut off the cross over road, as they would have done if he had not hooked them.

A train from Sunderland, consisting of a tank engine, a second, a first class, a composite, and a guard's van, coupled in the order stated, arrived at the high level bridge about 10.50 a.m. The distant and junction signals were lowered by the men in No. 1 and No. 2 huts, for the train to enter Newcastle central station. The man in No. 2 forgot that he had hooked over the points in the wrong direction when he lowered the signal for the passenger train.

It approached the junction at a speed of about six miles per hour. The driver shut off his steam about 50 or 60 yards before he reached No. 1 hut. When he got about 25 yards from No. 2, hut he perceived that the points were open for the goods siding, on which the goods engine was moving slowly towards him. He whistled, to try to make the signalman aware of his mistake, reversed his engine and put on steam, the guard and fireman applied the

breaks, but they could not succeed in stopping the train, which struck the goods engine at a speed of about four miles per hour. Thirteen passengers are reported to have been injured, but none of them severely.

The driver of the passenger engine and the firemen of both engines got off just before the engines struck. The driver of the goods engine remained at his post and was not hurt.

The buffer planks of both engines were broken, and some other slight damage was done to the engines and rolling stock.

The two front wheels of the carriage next the engine were the only ones that got off the rails.

The system by which the permanent way inspectors on the North-Eastern Railway supply ordinary platelayers to act as signalmen at the most important stations seems most objectionable, and so is that of hooking over the points, which ought always to be held.

I would suggest the desirability of the Company keeping an adequate number of duly qualified men to act as relief men when signalmen are absent from sickness, leave, or other causes.

I would also suggest the desirability of improving the whole arrangements of signals and points at the junction at the high level bridge, at Newcastle.

The whole of the signals and points connected with the junction should be brought under the control of one man. He should be placed in a hut elevated on a bridge, over the line of rails. The points and signals should be arranged on the locking principle, and the five goods and five carriage sidings should be connected with the main lines by one line of rails, controlled by a signal from the junction hut.

I have, &c.

*The Secretary
Board of Trade,
Whitehall.*

F. H. RICH,
Capt. R.E.

NORTH-EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 14th November 1865.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of the Directors of the North-Eastern Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred at the Gateshead station on the 10th ultimo.

I am, &c.

W. D. FANE.

*The Secretary of the
North-Eastern
Railway Company.*

SIR,

Sheffield, 9th November 1865.

IN compliance with the instructions contained in your minute of the 18th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 10th ultimo, at Gateshead, on the North-Eastern Railway.

Proceeding southward along the main line of the North Eastern Railway, from the high-level bridge over the Tyne between Newcastle and Gateshead, there is, first (after the Gateshead station) the Greensfield junction with a mineral branch and the locomotive sheds; secondly, the Hawk's cabin, at the junction with the Gateshead goods sidings, 539 yards from the above; thirdly, at 365 yards further, the Washhouse Lane level crossing, with a semaphore signal; fourthly, at 247 yards, a distant-signal worked by wire from the Hawk's cabin; fifthly, at 587

yards, another distant-signal worked by wire from the Washhouse Lane, and 834 yards from that level crossing; and sixthly, 1102 yards from the last-mentioned distant-signal, the Felling, or Green Lane, level crossing, where there is also a semaphore signal. The distance, therefore, between the above level crossings is 1,936 yards, or rather more than a mile, and the gradient between them falls towards the north, at the rate of 1 in 360.

The 4.30 p.m. passenger train from York to Newcastle left the former station punctually, and Pelaw Main at 7.47, seven minutes late, on the evening in question. It consisted of an engine and tender, eight passenger carriages, one break-van containing a guard, and a spare van behind it without a guard. The engine-driver found the signal of the Felling crossing at *all right*, but shut off his steam in passing it, as a matter of precaution. He looked, he says, for the distant-signal from Washhouse Lane; but he could not see it, on account, he supposes, of the rain. He did not see the Hawk's cabin distant-signal until he was within 300 yards of it, because it was obscured by steam from the engine of a goods train which passed him in the opposite direction. He then reversed his engine and whistled for the guard's breaks, but he did not do more than reduce his speed from 30 miles an hour at the Felling crossing to 10 miles an hour before he struck a goods-van 90 yards on the north of the Washhouse Lane.

This van and an engine in front of it, were thrown forward against another goods-van, which was standing at the tail of a goods train: and the second van was lifted up and forced violently through a substantial wall on the west of the line. It was much broken, and two of the waggons before it were also damaged. Fifteen of the passengers have complained of injury.

The down line, on which this collision occurred, had been blocked by traffic for a considerable time, under circumstances which I shall next describe. About 7.4 p.m. a coal train from the south stopped a few yards to the north of the Hawk's cabin. The engine-driver ran round the up line to the back of his train, and waited to go across the up line into the goods sidings. But the mail train from the north was due at 7.12, and the signalman, having no telegraph or other means of knowing whether it was punctual, was obliged to keep him and his coal train on the down line until it had passed. About 7.15 a goods train arrived from Tyne Dock, and was brought to a stand behind the coal train. Shortly afterwards a mineral train came up and stood behind the goods train. The meat train, also, so called because it contained return waggons, now otherwise loaded, but which had conveyed meat to London on the up journey, arrived behind the mineral train. It had left York at 1.35 instead of 12.20, in consequence of the up meat train having been late from the north. The engine-driver found the distant signal from Washhouse Lane and Hawk's cabin at *danger*, and almost came to a stand at the former, while his guard dropped off and ran back with a hand-lamp and fog-signals. The guard stopped an engine, No. 2, that was following with a goods train, and went further south, at the request of the driver of that engine, to tell the goods guard to go back for its protection. Having done so he returned to his own train.

This next, a special goods train, left Ferryhill at 6 p.m., and reached the Washhouse Lane at 7.25, with engine and tender, 15 waggons and a van. After hearing, from the guard of the meat train, why they were stopped, the guard of this train went back to protect it with fog signals. It is stated to have been kept about 10 minutes at the distant-signal and 10 minutes more on the north of Washhouse Lane before the collision occurred.

The special goods guard had gone about 100 yards when he met No. 392 engine with a van behind it. Having stopped it, he went forward, without saying anything to the engine-driver or guard, to see for himself the cause of the detention. The driver of No. 392 engine left Tyne Dock at 7.10 for Newcastle, and found the signal at the Felling crossing at *all right*, and the distant-signals from the Hawk's cabin and the Washhouse Lane at *danger*. He first stopped three quarters of a mile south of the Washhouse Lane, and told his guard to go back, as there seemed to be two or three trains ahead, and to look out for the next engine. After waiting for eight or ten minutes he moved forward, following the train before him, three times successively, until, at last, he stood, as nearly as he could tell, 50 yards north of the Washhouse Lane, and 20 yards behind the next train. When he saw the passenger train coming, he moved forward again; and seeing that a collision was inevitable, he endeavoured, by reversing his engine as it was struck, to break the shock against the train in advance.

The mail train from the north passed the Hawk's cabin about 7.35 or 7.40, 23 to 28 minutes late, and the signalman then allowed the first (coal) train on the down line to cross the up line and go into the

sidings. The Tyne Dock goods and the mineral trains went forward as soon as the line was clear, the former taking with it a truck for Gateshead to Newcastle. The engine-driver of the meat train pushed the eleven trucks which he had to leave across the up line, and, to save time, the engine-driver of the coal train took them away for him into the sidings. As the meat engine returned to the down line to take its train forward the signalman saw the 4.30 passenger train from York approaching, and heard the whistle of its engine, which was followed by the crash of the collision.

The night was clear but dark, and there is no doubt that the distant-signals from Washhouse Lane and Hawk's cabin were at *danger*, while the signal at the Felling crossing was at *all right*. The gateman at that crossing states that whenever he sees the distant-signal from Washhouse Lane at *danger* he turns his signal to *danger* also, but that he had taken his signal off on this occasion (while the Washhouse Lane distant-signal was at *danger*) because the preceding train had passed him more than ten minutes. The engine-driver of the passenger train may naturally have been misled by this apparently exceptional proceeding on the part of the gateman, but even then he would have been able to avoid the collision if he had not missed seeing the Washhouse Lane distant-signal.

The preceding statement tells its own tale, and requires but little comment. A signalman at a most important post, where the traffic is enormous, and which is passed by all the through trains of the East coast route between England and Scotland, had no means of knowing when a fast train might be expected and when he could properly, if it were late, obstruct the up main line. The consequence was that a coal train, a Tyne Dock goods train, a mineral train, a meat train, a special goods train, and an engine and van, were successively stopped on the down main line. In keeping one line clear the signalman necessarily obstructed and endangered the traffic upon the other line, and he states that the main line is frequently—say two or three times a week—obstructed about that time in the evening.

It is evidently desirable that the siding accommodation on this part of the line should be increased, and that a good system of telegraph working should be introduced, both to avoid delay in shunting and to afford greater security to the traffic.

There are already telegraph bells, but not instruments, at the Greensfield cabin, 539 yards north of the Hawk's cabin, by which the signalman at the former cabin is placed in communication with other signalmen north and south of him; but the system requires extension to other cabins and stations, and improvement; and, indeed, the general arrangements both north and south of the high-level bridge require to be reorganized and fitted with modern appliances.

I have, &c.,
H. W. TYLER,
Capt. R.E.

*The Secretary of the
Railway Department,
Board of Trade.*

NORTH-EASTERN RAILWAY:

*Board of Trade
(Railway Department),
29th January 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North-Eastern Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with

the accident which occurred on the 30th December last, at the Ampleforth Station on the North-Eastern Railway.

*The Secretary of the
North-Eastern
Railway Company.*

I am, &c.
W. D. FANE.

SIR, No. 1, Whitehall, 25th January 1866.
 IN compliance with the instructions contained in your minute of the 9th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 30th December last, at the Ampleforth Station on the North-Eastern Railway.

This station, on the Malton branch of the above railway, is about 8 miles from its junction with the main line at Pilmoor. There is a public road level-crossing on the west of the passenger platform, and a siding on the north of the line west of the level crossing. The line is single, and the points which connect it with the siding face towards the eastward.

A passenger train, commonly called the "Scotch express," but frequently running without passengers, leaves Thirsk daily at 9.40 for Pilmoor, Coxwold, and, passing Ampleforth without stopping, for Gilling; reaching Gilling at 10.15, and returning from that station at 10.25.

On the day in question this train left Gilling, the next station east of Ampleforth, on its return journey, at 10.29, four minutes late, for Pilmoor. It was not due to stop at Ampleforth, and the engine-driver ran through that station at 25 miles an hour. He was travelling tender first, and had a carriage containing one passenger, and a break-van with a guard in it, behind his engine. The signal was at *all right*, but he saw men crossing and re-crossing to the siding as he approached. He therefore blew his whistle, and they left the main line, "one towards the right and "two towards the left." He did not see the points beyond the level crossing, but he found as he passed through them that his tender and engine ran into the siding instead of continuing its course along the main line. He at once did his best to reduce his speed, but his tender came into collision with a lorry and two waggons on the siding, and forced them partly over and partly through a mound of earth at the end of it, about 90 yards from the points. The tender and the trailing end of the engine also mounted this bank of earth.

The tender and engine ran into the siding without any jerk, and remained on the rails of the siding until they reached the buffer stop at the end of it. The carriage followed into the siding, and its leading wheels remained on the siding rails after the accident; but its trailing wheels were pulled off the rails by the break-van. The break-van ran along the main line through the points, and was violently pulled off the rails towards the siding after it had passed through them. One of the main line rails was thus fractured, but the van stood on its wheels after the accident, with its front end towards the carriage, and its hind end towards the main line. None of the couplings gave way.

The siding points are, or ought to be, always kept locked for the main line, and the only key by which they can be opened is in the charge of the station-master. The station-master states positively that they were locked as they ought to have been on this occasion, so as to be right for the main line; and further, that they had remained locked from the day before, when they were last used, and when he had locked them himself, as well as that the key by which only they could have been unlocked was in his pocket when the accident occurred. A farmer of Ampleforth, who witnessed the accident, corroborates the station-master's assertion to a considerable extent. He noticed when he first came to the station that "the points were quite close, and set for the main line, that the padlock was on, and the lever was "below the pin." He talked to the station-master for about two minutes, went with him to the weigh-house, paid him for coals, and asked for a parcel. He then walked with him to the coal depots (east of the platform), and seeing the train coming from Gilling,

he pointed it out to him, and walked back with him along the platform. He did not then again notice the points, but he was standing with the station-master a few yards from them when the engine ran through them in the wrong direction. After the accident he saw the station-master run to the points, unlock the padlock, take it off, take the pin out, lift up the lever, and shut it down again.

The evidence of this witness was, however, somewhat weakened by a too minute, and evidently incorrect description of other circumstances.

Two bricklayers, who were engaged in building cottages near the railway, went to the station on that morning for some flooring tiles. Unable to obtain a waggon for their conveyance, they took a lorry from behind the station buildings into the siding, and they were loading it with the assistance of a labourer as the train approached. These were the men whom the engine-driver had seen, and for whom, as already stated, he had whistled. One of them, John Bilton, was unfortunately run over and killed by the engine as it turned into the siding. The survivor, Joseph Hickson, states that he and Bilton carried the lorry into the siding, without taking it through the points; but that they intended to push it out loaded through the points after the train had passed from Gilling. He asserts that he did not see anything of the points, and does not know whether they were locked before the accident. He adds, "the station master said we were to take "the bogie (lorry) to the siding after the train passed "to Gilling, and load it there until the train came "back from Gilling, and that was why we did so. "I expected that we could bring the bogie out of "the siding without the interference of the station "master after the train had come back from Gilling."

The station master contradicts Hickson, in saying that he did not speak to him the whole morning;—that Bilton asked him for a bogie or a waggon;—that as he had not a waggon for him he told him he might have the bogie, but must wait till the express train passed to Gilling and back again. He adds that he first saw the bogie in the siding when the train was a mile and a quarter from the station on its return journey, and that he then put his hand up to find fault with Bilton for taking it into the siding.

The points were uninjured by the accident, and the trains have since been running through them the same as before. They were unaltered when I saw them on the 19th instant, and were then in good working order. It was quite impossible that when they were locked so as to be right for the main line an engine should run through them into the siding. They must have been not only unlocked, but also blocked over for the siding, to allow of an engine so running without injuring them, and without leaving the rails as on this occasion; and the block or fastening by which they were held over must have been removed by the engine or carriage so as to allow them to fall back to their normal position, and thus to turn the break-van in the other direction along the main line.

The station master admits that the key of the points was in his possession, and that they have not been altered since the accident; and I have no doubt whatever that he must have unlocked them himself, or have allowed the bricklayers to do so, if they were locked at all, before the accident occurred.

I should observe that the engine-driver had not so good an opportunity of seeing them as he would otherwise have had in approaching them, because his engine was travelling tender first, a system which is for other reasons highly objectionable.

The only passenger who travelled by this train appears to have escaped without injury, but the guard was thrown down in his break-van before he knew what had happened, and was hurt in the back.

I have &c.

The Secretary of the Board of Trade, H. W. TYLER,
 Whitehall. Capt. R.E.

PRESTON AND WYRE RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 27th October 1865.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, for the consideration of [the Lessees of the Preston and Wyre Railway,] [the Directors of the London and North-Western Railway,] [the Directors of the Lancashire and Yorkshire Railway,] the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred on the 27th September between a passenger train and a goods train at the Lea Road station on the Preston and Wyre Railway.

I am, &c.,

W. D. FANE.

*The Secretary of the
Lessees of the
Preston and Wyre
Railway Company.*

*The Secretary of the
London and North-Western
Railway Company.*

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

SIR, *Hampton Court, 20th October 1865.*

IN compliance with the instructions contained in your letter of the 28th ult., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 27th ultimo, between a passenger train and a goods train, at the Lea Road station on the Preston and Wyre Railway.

On the morning in question, as well as on certain other mornings, specified in the enclosed notice, a London and North-Western special train was advertised to leave Oldham at 6.30 a.m., and to reach Blackpool at 9.55, taking up passengers at Ordsall Lane (Manchester) and other intermediate stations. But after the passengers at Ordsall Lane had been kept waiting for an hour and thirty-eight minutes, an independent train was started at 9.15 from that place, consisting of an engine and tender, 14 carriages, and a break-van. The number of the passengers increased from the different stations as the train proceeded; two more carriages were taken on at Tyldesley, and three at Wigan; and it reached Preston at 10.55, with 19 carriages and a van, conveying about 700 passengers. It passed through Preston slowly, and the engine driver, who had only been once before to Blackpool, and did not feel competent to conduct it further, called out for a pilot. A porter was sent with him from the platform to act in that capacity by the inspector on duty, and as other trains were due in the Preston station (which has for many years required extension and improvement) he was passed on to Maudlands, 600 or 800 yards beyond that station, to take water. The train was left upon the main line at Maudlands, while the engine uncoupled and went to the water crane in the engine yard; and as soon as the engine returned it proceeded at 11.5 towards Blackpool.

The engine-driver and porter-pilot ascertained from the signalman at the Maudlands junction as they passed that there was no train in front of them; but after having travelled for a couple of miles, and at some 25 miles an hour, through a cutting south of the Lea Road station, the engine-driver saw a signal before him, and asked the porter-pilot what it was. The porter replied, according to his own account, "Lea Road distant signal; whistle it off;" or, according to the account of the engine-driver, that it was

nothing, and that if he would blow his whistle it would be taken off. The engine-driver, however, shut off his steam, and blew his whistle, and the fireman applied the tender-break. The engine-driver also reversed his engine, by his own statement at the same time, but according to the porter when he had rounded a curve which brought him within sight of the station.

On coming thus upon the straight line he saw, about 770 yards before him, a goods train standing upon the line on which he was travelling, with the engine towards him; and finding that he could not pull up, he motioned to the driver of that engine to set back. The station-master at Lea Road, who saw that the passenger train was coming too fast to be able to stop, also directed the goods-driver to get out of the way, and he did his best to obey. But he had not attained a speed of more than 4 miles an hour, or gone more than 70 yards from the station building, before his engine was struck by that of the passenger train at a speed of perhaps 10, or, as the goods driver states, 15 miles an hour.

The driver, porter, and fireman all jumped from the passenger engine before the collision occurred, as well as the fireman from the goods engine, but the driver of the latter remained on it and was unhurt.

The passenger engine, which was less damaged than the goods engine, had its buffer-plank broken and its framing bent. None of the carriages were damaged or thrown off the line, though the waggons suffered more in these respects. About 40 passengers have complained of the effects of the accident, though all but three proceeded forward to Blackpool in the train at 12.40.

The guard, who had been taken suddenly from regular duty between Patricroft and Manchester to go with this passenger train, rode in the 17th vehicle. He was sitting by the side of his break looking forward when he heard the engine-driver whistle. He applied his break, and believes they slackened speed from 20 to 25 down to 7 or 8 miles an hour before the collision occurred.

The goods (a Lancashire and Yorkshire) train left Fleetwood at 9.15 for Poulton, Kirkham, and Maudlands. Though due to leave Kirkham at 9.50, fifty minutes in advance of the 10.10 passenger train from Fleetwood, it was in the habit most frequently of shunting from the up to the down line for that train to pass it at that station. But on the present occasion, as the passenger train was late, the station master directed the goods driver to go forward and shunt at Salwick. The permanent way was, however, under repair at Salwick; there was no available siding there; and the cross-over road between the two main lines had been temporarily taken up: so that the goods train necessarily proceeded to Lea Road. It consisted of an engine and tender, 56 waggons, and two break-vans, and had been shunted from the up to the down line at that station about five minutes before the down passenger train came up.

In approaching Lea Road from the south there is a falling gradient of 1 in 330 up to within 900 yards of the station, after which the line is level. The distant signal is about 580 yards from the station, and is visible without obstruction for 450 yards. A tree then obstructs it for a short distance, and at 546 yards it is again lost sight of, in consequence of a curve which runs on a radius of 75 chains through a cutting. It is again visible, though not distinctly, at 728 yards, and may be seen for some 700 yards further.

On the present occasion, the driver of the passenger engine did not see it until after he had passed the cutting, and the porter who accompanied him as his guide was not aware that it was visible from the south of the cutting. They then had upwards of 1000 yards in which to pull up, and

they ought to have been able to bring the train to a stand within that distance if they had been provided with a proper proportion of break power. But with the preposterously small allowance of one van to 19 carriages, a stoppage within a reasonable distance could not be expected.

I cannot attach blame to the London and North-Western engine-driver, considering that he was avowedly unacquainted with the line, was in the hands of a pilot, and was not provided with sufficient break power.

The porter who accompanied him came on duty at 7.30 a.m., after his breakfast, and was doing porter's duty at the Preston Station till 10.45. He was then suddenly called upon to pilot this train to Blackpool, a duty which he had never performed before. He had some acquaintance with the line, from having acted as guard in charge of a train over it six times, and from having frequently travelled over it to do duty as ticket collector or porter at other stations. But his ideas with regard to the observance of signals were far from satisfactory. He had previously heard that there were no trains before him. He did not know there was a cross-over road at the Lea Road station by which a train could be shunted from one main line to the other, any more than the point from which the distant signal was first visible. And he evidently thought that signal was kept at danger for the protection only of a public road level crossing which occurs at the station. He was certainly not properly qualified for the important duty on which he was sent.

The Preston and Wyre Railway is leased in perpetuity to the London and North-Western and the Lancashire and Yorkshire Railway Companies. The traffic upon it was until within the last two years worked entirely by the engines of the Lancashire and Yorkshire Company. But occasionally for these two years, and regularly during the past summer, the London and North-Western Company have sent their own excursion trains through to Blackpool. As the engine-drivers of the latter company had not previously been in the habit of running over the line, the joint manager of the Preston station and of the Preston and Wyre Railway, instructed the station superintendent to ascertain on the arrival at Preston of each London and North-Western train for Blackpool whether the engine driver was acquainted with the line, and, if not, to send with him as pilot the best man he had. The foreman pointsman from Preston appears to have been more commonly employed on this piloting duty, but in his absence porters have been sent with the trains, as on the present occasion. A luggage porter cannot be considered in the general way a fit person to send as pilot with a strange engine-driver. It is always more proper to employ another engine-driver acquainted with the line for such a duty; but there are no engine drivers connected with the establishment of the Preston and Wyre Joint Railway; and the manager

and superintendent at Preston did what they could under the circumstances in sending a pointsman or a porter with the London and North-Western trains. The London and North-Western Company, on the other hand, made no provision themselves for ensuring the safety of the public in running their trains over a line of railway with which their engine drivers were unacquainted; but they trusted to the joint officers of the Preston and Wyre Railway to forward those trains safely to their destination.

It is desirable that the London and North-Western Company should in future, when they send their trains over this line with engine-drivers that are unacquainted with it, provide a pilot engine-driver to accompany them for that portion of their journey.

As far as the passenger train was concerned then, the collision was caused by its having been sent forward with a strange engine-driver and guard, with an inefficient pilot, and with a grossly insufficient proportion of break power. And it so happened that the goods train was, while being taken out of the way of another, shunted into the way of this train at Lea Road.

This system of shunting from one main line to another is always objectionable. But it is very common on this line for the want of more sidings.

This particular train has most frequently to shunt to the wrong line at Kirkham, though it sometimes does so at Salwick or Lea Road. On the present occasion the officer who performs all the duties at Lea Road transferred it from less danger on the up to greater danger on the down line, in ignorance, for want of telegraphic information, as to when he might expect the trains upon these lines respectively. It is very desirable and necessary to safety, that a telegraph should be supplied at Lea Road and employed for working the trains, and that sidings should be constructed in suitable localities on different parts of the line, into which the slow trains may be shunted, when necessary, out of the way of the fast trains.

I had occasion to recommend, also, when on the spot, that the distant signal south of Lea Road should be raised, in order that it may be seen from a distance against the sky instead of against some trees which render it very indistinct, as well as that it should be adjusted to turn more nearly at right angles to the direction of an approaching train. It might with advantage be moved further from the station, and an efficient platform signal is much required at the station.

Improvements have as yet by no means kept pace on this line with the very heavy traffic that has grown up and is annually conveyed over it to and from Fleetwood, Blackpool, and Lytham.

I have, &c.,

H. W. TYLER,
Capt. R.E.

*The Secretary of the
Railway Department,
Board of Trade.*

SOUTH DEVON RAILWAY.

Board of Trade

(Railway Department),

Whitehall, 4th January, 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, to be laid before the Directors of the South Devon Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the accident that occurred on the 25th November last to a goods train from getting off the rails near the Cornwood station of the South Devon railway.

I am, &c.

W. D. FANE.

*The Secretary of the
South Devon
Railway Company.*

SIR,

Whitehall, 28th December, 1865.

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your instructions of the 29th ultimo, the result of my inquiry into the circumstances which attended the accident that occurred on the 25th ultimo at the Cornwood station of the South Devon railway, when the driver, John Rowsell, and fireman, Thomas Palmer, of the 10 a.m. down fast goods train were so much injured that they died within a few hours of the occurrence.

It appears that as the train, which consisted of a tank engine, 10 trucks and 2 break vans, with two guards, was proceeding towards Plymouth, between Ivy Bridge station, which is $11\frac{3}{4}$ miles from Plymouth, and Cornwood station, $2\frac{1}{2}$ miles from Ivy Bridge, the guards heard the break whistle

sounded when the train was either on or close upon the Blatchford viaduct which is about $\frac{3}{8}$ of a mile east of Cornwood station; and they state that they immediately applied their breaks and kept them on until the train stopped, and it was then found that the engine and five trucks adjacent to it had got off the line, and the engine had turned partly round and had fallen over on its right side. The driver was thrown off the engine, and was found lying on the side of the cutting surrounded and embedded among some barrels of tallow and broken trucks. The fireman was first seen creeping out from under the broken trucks. Both men were frightfully scalded from the safety valves being knocked off, and the driver received severe internal injuries. Neither gave any explanation of the cause of the accident, nor as to the reason for sounding the break whistle, as the train was not intended to stop at the Cornwood station.

The train, according to the head guard, arrived at Ivy Bridge at 2h. 20m. and left at 2h. 25m. having been detained five minutes for the up north mail from Plymouth to pass. The station master names 2.26 as the time of leaving. The train was rather more than half an hour late. It is allowed four hours to do the distance between Exeter and Plymouth, ($52\frac{3}{4}$ miles,) and as the stoppages are estimated to occupy 50 minutes that would give an average rate of somewhat under 17 miles an hour. The head guard states that he looked at his watch after the accident, when he had got out of his van and had reached the head of his train, he thinks about 2h. 35m., but the figure 33 can be seen under the 35m. in the entry in his memorandum book.

On examination of the engine and line after the accident, the spring pin which supports the after end of the right leading spring of the engine was picked up on the line 49 chains 41 feet back from the spot at which the engine lay on its side, and 25 chains 17 feet from the broken spring pin, towards Plymouth, the first marks were traced of the wheel of some vehicle being off the rails, inside the left rail on the longitudinal timber, and three feet further on the head of a fang bolt outside the right rail was indented, evidently by the flange of a right wheel. From this spot, which is over one of the piers about the middle of the Blatchford viaduct, to within 2 chains 28 feet of the place where the engine lay, the permanent way is marked inside the left rail, mostly on the transoms, and outside the right rail on the edge of the longitudinal timber, and at this spot there is a very distinct mark of a wheel having mounted the right rail at a joint. The inner flange of the left rail immediately beyond is cracked close to the rail and thence forward the whole line was torn up and had to be renewed.

The marks inside the left rail on the transoms were from $7\frac{1}{2}$ to $8\frac{1}{2}$ inches from the inner edge of the rail, and my impression is that these marks could not be made by the leading wheels of the engine being off the rails and running with the other two pairs of wheels on the rails, for a distance of upwards of a quarter of a mile, and further that the engine mounted where the end of the rail at the joint is so plainly marked. I have already stated that the first marks on the permanent way were found about the middle of the Blatchford viaduct, which was originally constructed with 13 openings of 61 feet, with stone piers and timber trussed tops, but iron girders have been subsequently inserted beneath the roadway. In the details of the line furnished by the engineer before it was opened for traffic, the curve of the line on this particular viaduct is stated to have a radius of 23 chains, and the gradient is stated to be 1 in 174 falling towards Plymouth. But the engineer of the line, Mr. Margary, informs me, that the curve on the viaduct at that part, where the first mark of a wheel is seen on the permanent way has only a radius of 17 chains, and that the incline is 1 in 152. When I examined the spot the rails were laid on the viaduct from $\frac{1}{4}$ to $\frac{1}{2}$ of

an inch wide to gauge, and the cant or super-elevation of the outer rail was about $5\frac{1}{2}$ inches.

A bulged rail occurs on the left rail, about three feet before the first mark on the permanent way inside that rail is reached, but the bulge in the rail is not in itself sufficiently large to cause a vehicle to leave the rails. The guards of the train state that it was not travelling at the rate of 30 miles an hour when the break whistle was first sounded, and a spare fireman, who was riding in the last van, names 25 miles an hour as the probable rate. But the ganger in charge of the length says it was travelling as fast as any of the passenger trains, and looking at the distance which the train ran after the break whistle was sounded and the guards put on their breaks and the time occupied between Ivy Bridge and Cornwood station, I think it likely that the ganger's statement is correct, and it is quite certain that passenger trains must pass over this part at a high rate of speed.

The engine which drew this train, the Hero, is a six wheel coupled tank engine, having the wheels of 4ft. 9in. in diameter, with the centres placed 7ft. 8in. apart, with $15\frac{1}{2}$ inch cylinders, and 24 inches stroke. It was new in April 1860, and ran till last March, when it came into the workshops for a thorough repair, up to which time it had run 140,764 miles. It left the shops again on the 6th June, and has not since been in the shops, having run 14,932 miles in addition.

		Tons. cwt.
The weight on the leading wheels is about		13 6
" driving "		13 14
" trailing "		11 6
Total -	-	38 6

It was running with the leading end in front, and when examined after the accident, the trailing axle was found to be slightly bent, but the leading and driving wheels were found true to gauge. The middle spring on the left side had the first and sixth plates broken, but the fractures were quite recent, and were probably caused when the engine fell over on its side. The right leading spring, of which the pin was found on the permanent way, half a mile back from where the engine lay, had the sixth plate broken and this was not a recent fracture. The engine a good deal damaged, and two of the trucks were totally destroyed, and three other vehicles were more or less damaged.

With respect to the causes which have produced this accident, it appears certain that some vehicle got off the rails on the viaduct, and ran on the permanent way, which is the usual one of bridge rails laid on longitudinal timbers adopted on the broad gauge system, for a quarter of a mile without any serious mishap.

It is surmised that the vehicle got 'off' on the outside of the curve in consequence of the break being suddenly put on in front, when travelling at considerable speed round a sharp curve with a comparatively light vehicle, a van, next to the engine, and much heavier ones in rear of it, and the surmise is not an unreasonable one when coupled with the fact that the cant of the outer rail at this part is not sufficient by about three inches. But there is no proof that this is the case. I think it however certain that the engine mounted the rail at the bad joint just where the roadway was entirely torn up. It is admitted that the fang bolts which secured the preceding rail at the joint were found bent by the ganger after the accident, and he says the joint was out the $\frac{1}{2}$ but not the $\frac{1}{4}$ of an inch, and that the line was all right without any bad joint when he walked over it in the morning of that day, but I must observe that the mark on the next rail could not have been made unless the preceding rail had been displaced outwards to the extent of at least half an inch. The breaking of the pin of the right leading spring would allow some portion of the weight to be taken

off the right leading wheel, and thus facilitate its mounting the rail on the outside of the curve, if any irregularity in the draft of a vehicle behind running off the rails occurred.

I should add that I think more attention should be paid to the packing of the longitudinal timbers that carry the rails, and to the regulation of the cant on sharp curves, which should be adapted to the speed of fast passenger trains.

I beg also to submit that it is highly desirable that the construction of the trailing ends of tank engines should be altered, so as to give the drivers and firemen a chance of saving their lives in the event of an accident occurring, by providing easy means of getting down from the engines on each side.

*The Secretary of the
Board of Trade,
Whitehall.*

I have, &c.

W. YOLLAND,
Col.

SIR,

*South Devon Railway,
Secretary's Office,
Plymouth, 23rd January 1866.*

REFERRING to your letter of the 4th instant, and to the accompanying copy of Colonel Yolland's report on the late accident at Cornwood, I am instructed by the Board of Directors to state that, although they have every reason to believe that the railway is most carefully maintained and anxiously watched by their engineer, they have given instructions to have the cant of the curves and the packing of the longitudinal timbers specially examined, as recommended by Colonel Yolland.

Colonel Yolland's suggestion that easy means of getting down from the engines on each side should be provided has been adopted, and the locomotive superintendent has been instructed thereon.

I am, &c.

*The Secretary,
Board of Trade.*

L. J. SEARGEANT,
Secretary.

SOUTH DEVON RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 15th January 1866.*

SIR,

I am, &c.

W. D. FANE.

*The Secretary of the
South Devon
Railway Company,
Plymouth.*

*Board of Trade
(Railway Department),
Whitehall, 11th January 1866.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your Minute of the 28th ultimo, the result of my inquiry into the circumstances which attended two consecutive collisions that occurred at the Plymouth station of the South Devon Railway on the 16th ultimo, on which occasion five passengers are said to have received slight injuries.

Plymouth station is in some respects an objectionable station, and limited for accommodation, although it has of late years been materially enlarged and improved; but the engines of all incoming passenger trains that arrive at the ticket platform at the East side of the down line are there detached, run ahead, and are then shunted back out of the way, while a pilot engine comes out from the engine shed siding, situated on the western side of the railway, and north of the ticket platform, crosses over the up main line and thence on to the down main line to the rear of the passenger train, which it then pushes forward from the ticket to the station platform, no very great distance, it is true, but involving the objectionable practice of pushing the train from behind, and also necessitating the bringing out another engine from the engine shed siding, or causing the train engine to run round the train, which operations would be entirely unnecessary if provision had been made in laying out the station for the train engine, taking the train on to the station platforms without uncoupling.

The switchman who calls the pilot engine out from the engine shed siding is provided with up and down distant signals to protect the pilot engine while in the act of crossing from the engine shed siding to the down main line, and for preventing an out-going train from leaving the platforms until this up distant signal is set at "all right." I am, however, informed that, in practice, the drivers of passenger trains do not look to this up distant signal at all, but to an up signal attached to the switches of a through back road, situated at the south end of the ticket platform, which is worked by the yard signalman, whose post is near the ticket platform, in accordance with the indications of the up distant signal worked by the engine shed switchman.

On the evening of the 16th ult, the 5.10 P.M. up Launceston train reached the ticket platform about 7.5; and immediately it stopped the engine shed switchman altered the switches, and signalled by hand lamp to the driver of the pilot engine to come out from the engine shed siding, and to proceed across to the main down line in order to push the Launceston train from the ticket to the station platform. The driver whistled, and started immediately, but before the engine had reached the crossing, the switchman saw the 6.30 P.M. down Cornwall passenger train approaching him from the station platform on the main line, and he then showed a red light towards the pilot engine, and the driver did all in his power to stop, but was unable to do so until he had fouled the up main line, and a collision immediately ensued. Attached to but in front of the pilot engine were three vehicles, a carriage truck and two vans; and the carriage truck, which was next to the engine, and the next van, were thrown off the rails, and, with the pilot engine were a good deal damaged; whilst the other van, by the shock of the collision, became detached, and ran down the steep incline of 1 in 63, and came into collision with the last vehicle of the Launceston train then standing alongside the ticket platform, but not doing much damage to it. The engine and a few of the carriages of the Cornwall train were also somewhat damaged in the first collision with the pilot engine.

The first collision was caused by the neglect of the engine shed switchman in having omitted to put his up distant signal on at "danger," before he signalled with his hand lamp to the driver of the pilot engine to come out from the engine shed siding. He forgot to do so, and the collision was the result of this omission. The second collision was occasioned by the van becoming detached by the shock of the first.

The first collision could not have occurred in the way I have described, if the engine shed switchman

had been provided with the proper signals, fitted with those mechanical appliances which are now almost universally adopted, to prevent signalmen from making mistakes that frequently lead to collisions through mere acts of forgetfulness.

As I have already stated, the Plymouth station has been considerably enlarged, and in consequence the signal arrangements for conducting a greater amount of traffic require to be re-organised and improved. Thus the engine shed switchman should be supplied with two additional signals; one for signalling an engine from the engine shed siding, and another for the goods sidings, to prevent trains from coming out on to the main line when it is obstructed. The up signal, at the south end of the ticket platform No. 1, should be worked by the engine shed switchman as his up distant signal for the main line, instead of the present up signal No. 2, which should be used solely for signalling on what is known as the 3rd line, on which the shunting is mostly done. The whole of the signals worked by this engine shed switchman should be constructed, with the locking apparatus for signals and points, &c., so that he may in future be prevented from making a mistake.

The yard signalman should continue to work a down distant signal, No. 3, for the main line, and another down signal, No. 4, whose position is to be slightly shifted, so that it may be placed south of the engine shed crossing. This signal will then be used for trains on the 3rd line. The up distant signal worked from the Cornwall junction should be removed southwards to a greater distance from the junction, and the yard signalman, engine shed signalman, and junction signalman should have the means of communicating by bells and gongs with each other, by which, they may be enabled to give warning from one signal station, in succession, to the next, when a train is about to enter or to leave the station. The sounding of the bells denoting the approach of an up, and of the gongs of a down train. The three men who are charged with the working of the train between the junction and station platforms will thus be furnished with the necessary facilities for doing their work in a satisfactory manner.

I have, &c.

W. YOLLAND,
Col.

*The Secretary,
Board of Trade,

VALE OF NEATH RAILWAY.

*Board of Trade,
(Railway Department),
Whitehall, 1st January 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred to a coal train at the Swansea North Dock drawbridge on the 29th November.

I am, &c.

W. D. FANE.

*The Secretary for the
Vale of Neath Section
of the Great Western
Railway, Neath.*

*Board of Trade
(Railway Department),
Whitehall, 20th December 1865.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 2nd instant, the result of my inquiry into the circumstances which attended an accident that occurred at the drawbridge which carries the Vale of Neath Railway over the entrance to the North Dock at Swansea, when the engine and 30 trucks of a coal train fell into the dock below, and the driver and fireman of the train were both killed.

This portion of railway, formerly a part of the Swansea and Neath but now amalgamated with the Vale of Neath Railway, and worked under an agreement by the Great Western Railway Company, contains a viaduct called, in the details furnished by the engineer of the line prior to the opening of the line, "The Swansea Eastern Viaduct," 581 yards in length, in which there are two opening drawbridges, one over the New Cut, which has a span of 62 feet, and the other over the North Dock, with an opening span of 73 feet, where the rails are rather more than 50 feet above the bottom of the dock. Both these bridges are telescopic bridges, which are opened and

shut by means of hydraulic presses, valve houses having been constructed close to the New Cut and North Dock bridges, and the telescopic portions of each bridge are pushed or closed across the open spans from the western towards the eastern side, and withdrawn or opened in an opposite direction.

The traffic over this portion of line is worked with the assistance of the electric telegraph and on the block system; and telegraphic signal stations, with the requisite out-of-door signals, are established at No. 1 the tank office, eastern side, No. 2 valve house of New Cut bridge, No. 3 valve house of North Dock bridge, and No. 4 at the signal box at Wind Street junction, Swansea. The out-of-door signals at the New Cut and North Dock bridges are worked in connexion with the closing of the drawbridges by the hydraulic presses, so that when the drawbridges are open danger signals are exhibited, and the signalmen have no power of taking them off; and when the drawbridges are closed, and the line is in a fit state for a train to travel over the drawbridges, "All right" signals are exhibited at each bridge. At night the lamps are lit by gas.

	Yards.
The distance between No. 1 tank office and signal and the signal at the New Cut bridge is - - - -	134 $\frac{2}{3}$
" between the signal at New Cut bridge and No. 2 valve house at New Cut is - - - -	82 $\frac{2}{3}$
" between No. 2 valve house at New Cut and the end of the bridge at North Dock, where the train ran over, it is - - - -	201
" between the place where the train ran over and No. 3 North Dock valve house, and signal corresponding with the actual length of the bridge, it is - - - -	51 $\frac{2}{3}$
" and between No. 3 North Dock valve house to No. 4, the signal box at Wind Street junction it is - - - -	124 $\frac{1}{3}$
Total - - - -	594 $\frac{1}{3}$

So that there is a total length of less than 600 yards between No. 1 and No. 4 signal station. I enclose a copy of the instructions for signalling trains between No. 1 and No. 4, and from these it will be seen that before a train is permitted to pass in either direction the question must be asked by telegraph, from No. 1 to No. 2, thence from No. 2 to No. 3, thence from No. 3 to No. 4, "A down train is ready to start; can it come on?" And the reply, "Line clear," must first commence at No. 4, if the "line be clear, and the bridge be closed," and be transmitted in succession to No. 3, No. 2, and No. 1.

The process is reversed with respect to up trains; the telegraphic questions being first asked from No. 4, and transmitted in succession to Nos. 3, 2, and 1, and then the reply, "Line clear," commences at No. 1 "if the line be clear and the bridge closed," and is sent back through Nos. 2 and 3 to No. 4.

By another set of instructions (also herewith enclosed), for working the junctions at Swansea, by No. 6 rule, No. 1 signalman is told that on receiving the signal, "Line clear," and being satisfied "by the bridge signals that the bridges are in position, his 'disc will be held over, to show 'all right' for a 'down train to proceed from No. 1 to No. 4,'" and although the two sets of instructions are not so good or so explicit as they might be made, it appears that both the signalmen at Nos. 1 and 4 should, if they did their duty properly, look to the state of the bridges and bridge signals, as well as the two signalmen at No. 2 and No. 3, who are directly responsible for not giving "Line clear" by telegraph, unless their respective bridges are closed, and fit for a train to run over them. Again, the driver of the train is also instructed to "satisfy himself" that the mechanical signals on the bridges show the "All right signal;" otherwise he will not proceed.

I should mention that the distances are so short that there is no difficulty under ordinary circumstances in the driver of a train and the signalmen at Nos. 1 and 4 signal stations seeing the mechanical bridge signals before the "Line clear" is given by telegraph, or the train started; but it is stated that it sometimes happens that they cannot be seen when there is fog, and when the copper smoke is blowing in a certain direction. Having thus explained the nature of the line, and the particular regulations adopted in order to secure its safe working, I shall now relate the manner in which the accident occurred.

On the early morning of the 29th ultimo, a down coal train having been made up at the eastern depot in the sidings adjacent to No. 1 tank office and signal station, the driver was desired by the guard of the train and the foreman on duty, Evan Davies, to whistle for signal No. 1 to be taken off, so that the train might proceed over the viaduct to the South Dock. The regular signalman at No. 1 tank office was not there, and the foreman did the duty for him. He states that "he asked the signalman at No. 2 valve house at the New Cut bridge for "Line clear" at 6h. 18m. a. m., and he received the telegraphic signal in reply, "Line clear" at 6h. 19m., at which time the train stood at the east end of the ticket platform, 370 yards from No. 1 tank office and signal, and that the signal at the New Cut drawbridge showed an "All right" signal; and he asserts "that he tried to see No. 3 "North Dock drawbridge signal, but could not, it was "so thick and hazy with fog and smoke." The foreman then lowered the signal, and the train proceeded.

I did not see either the signalmen at Nos. 2 or 3 valve houses at the drawbridges, as both had been apprehended by the police, and been brought before the magistrates, but were out on bail, and endeavours were made to find these men in the town, but they could not be traced. The signalman at No. 2 valve house, Bartlett, at the New Cut drawbridge, made a statement to the company's superintendent of police to the following effect: "I left my house, Cawnpore Street, at about a quarter past 4 a.m., and was at the

"bridge in about five or six minutes, and found the "bridge open, and the red light on the signal. The first "thing I did was to open my stop valve, and found that "there was no pressure on to shut the bridge. At "about a quarter to 5 I called to the man at the "harbour engine office, to ask when he would be "ready, and the boy answered, in a few minutes; "and in two or three minutes the harbour trust engine " (which works the hydraulic presses) was started, "and I had my pressure, and closed the bridge at "once. I then gave the signalman at No. 3 valve "house at the North Dock drawbridge, John "Howells, four beats on the gong (directing him to "close his bridge), which he acknowledged by giving "four in return, and I gave him one in acknowledgment of his four. About seven minutes before the "train came the signalman at No. 1 tank office "asked for 'Line clear.' I asked John Howells at "North Dock bridge the same (three beats on gong). "In about half a minute he gave me one beat on bell, "acknowledging my signal; in about another half "minute he gave me 'Line clear' (one beat on bell), "and the needle pointing to the words; I gave the "same to No. 1 tank office, and in five or six minutes "I could hear the train moving, and it passed me "at about six miles an hour. The driver, William "Cole, had his right hand on the engine rail, and "with his left he was working the regulator in and "out, as it was so slippery. He said, 'Here we are "again with a heavy train, and no sand; it was the "same on Tuesday morning. At this time I was "standing on my platform with my white light "shown towards the train, and when the last truck "reached opposite, Mr. Gerrish, the guard, was on it. "He said 'Charlie, what red light is that?' I said 'What "red light?' and on looking round I saw the red "light on at the North Dock drawbridge, and said "something which I do not recollect, and then I fell "over the rollers in the hole which the drawbridge "traverses. At this moment I heard the crash of "the engine and trucks falling. Some time afterwards I met John Howells, who is my brother-in-law, and lodged at my house, and said unto him, 'John, "what have you done in giving 'Line clear,' and your "bridge open?' He said, 'Oh dear, dear, it's my fault.' "Bartlett also stated, that 'I did not look for the red "light at North Dock drawbridge, as I had the "telegraph message so correct."

The porter, James Evans, who performs the signalman's duty at No. 4 signal box at Wind Street Junction, between 5 and 9 a.m., states, "that at 6h. 18m. a.m. "John Howells, at No. 3 North Dock drawbridge, "asked me on the telegraph if the line was clear (three "beats on the gong) I gave him 'Line clear' (one "beat on gong) instantly. He gave me one beat back "acknowledging my signal. I put the points right, "and lowered the semaphore signal to caution. I "then entered the time of giving the signals in the "book, and whilst doing this I heard the train "coming at 6.27 a.m. I heard the crash, and saw the "fire flying upwards from the engine. I ran out of "the box, but instead of going down the steps I slipped "under the handrail, and fell on the platform, 22 feet "below. My feet and legs were stunned, and I could "not move for a minute or so. As soon as I could I "went toward the bridge, and saw the last two or "three trucks going over. I then went down John "Howells's ladder and over Toll Bridge. I saw "Howells there, but missed him shortly afterwards; "but I saw him again afterwards in the Wind Street "station office. He said 'No one was to blame but "himself."

This signalman admits that "he did not look to see "that the bridges were closed before he gave 'Line "clear.'" He says that "it was a foggy morning; "there was a small fog, and it was very dark; that "he might have seen the signal, but could not see "the bridge at the North Dock."

I did not see the guard, George Gerrish, of the train, as he had met with a very serious accident while on duty on the previous day, and had broken

his leg. I was informed that he was likely to do well.

I was furnished with the statement which he had previously made to the officers of the railway company. He confirms the previous statements which I have recited as to the exhibition of the "All right" signal at No. 1 tank office, and the starting of the train; and he says "that he got up, and "rode on the last truck in the train, which started "slowly, and on that truck reaching the New Cut "Bridge, when about 5 yards from No. 2 valve "house, he saw the red light on at the North Dock "bridge, and asked Bartlett, the signalman at the "New Cut bridge, what red light that was ahead; "he replied, 'O Lord, its too late!' He (the guard,) "then showed his red light towards the driver, and "commenced putting down the breaks on the trucks, "and succeeded in getting down five or six altogether. "That at that moment he saw the engine tipping up, "and fire scattering about from it; that the trucks "followed so fast that he could not keep up with "them, and the last one went in slower than the first, "as it began to fill up. He states that he did not "notice the red light at the North Dock bridge from "No. 1 tank office, as it is sometimes so thick with "fog and copper smoke that it cannot be seen, but "that he does not know if it was so on that occasion."

The engine appears to have fallen on the stonework of the lock below, on the level of the surface of the ground, and then it turned over, with the ends reversed, and fell to the bottom of the lock with the wheels uppermost. The whole of the trucks followed the engine and fell into the lock below.

The two unfortunate men, the driver and fireman, went down with the engine, and appeared to have been drowned. Strange to tell, the lock gates below, which were only a little removed to one side, were uninjured, as only a slight mark could be seen on them, or the damage to shipping would probably have been very great by the lowering of the water. The damage to the engine was considerable, but not so great as might have been anticipated from falling from such a height. The depth of water in the lock, about 18½ feet, probably broke the force of the blow. The buffer planks and buffers, life guards, sand box, coal box on foot plate, smoke box, chimney, saddle tank, and all the brass mountings and ornamental work of the engine were damaged. Ten of the waggons with wooden under frames were regularly smashed, and will have to be rebuilt; but the principal part of the waggons had strong under framing, and these, with the iron boxes which contained the coal, were not so much damaged. The bridge was but little damaged. Altogether the damages to the rolling stock, loss of coal, and cost of labour, will probably not fall far short of 2,500*l*. The engine No. 16, which drew this train, was a 6-wheeled coupled broad gauge tank engine, having 17-inch cylinders and 24-inch stroke, with wheels 4½ feet in diameter; its weight being about 40 tons. It was travelling tender foremost, so that when the driver was attending to the working of his engine he must have been looking towards the rear of the train. The load of the train amounted to about 500 tons.

With respect to the various causes which have led to this lamentable accident, I am constrained to say, that I do not recollect any instance in which so many servants of a railway company appear to have been so remiss and guilty of such gross negligence; and, as it appears to me, those who lost their lives were about the least to blame. Thus the signalmen at Nos. 1 and 4 signal stations are specially enjoined, the one not to give "Line clear," and the other not to start the train, until the bridges are closed and in position; and the duties of the men at Nos. 2 and 3 valve houses were obviously not to give "Line clear" until the bridges had been closed by their own intervention. It is true that the signalman, Bartlett, at No. 2 valve house, did not give 'Line clear' by telegraph until he was so informed by signalman

John Howells, at No. 3, North Dock valve house, that it was clear, and that he had closed his own bridge; but, on the other hand, he may be said to have lured the unfortunate driver of the train on, by exhibiting to him a white light with his hand lamp from a spot only 201 yards from the opening that stood ready for the train to drop into, when by turning his head in that direction he could not have failed to see the red light at danger on No. 3, North Dock drawbridge.

It may be urged that the driver and fireman should have observed the red light at No. 3, North Dock drawbridge, before they started, but the evidence is contradictory as to its being visible from the spot at which the train started, 370 yards back from No. 1 tank office and signal; and it must not be lost sight of, that the inevitable result of working traffic on a line by the telegraph and on the block system cannot fail to be, that a less vigilant look-out is kept by driver and fireman than on a line where they are not told anything about its being clear to the next station. The man principally to blame is the signalman John Howells, at No. 3 valve house at the North Dock drawbridge, as the accident evidently resulted from his act alone, although many of the others, including the foreman at No. 1, if they had done their duty properly, might even then have prevented it.

With respect to the driver and fireman, they had not passed any danger signals; but, unfortunately for themselves, they had approached one of the drawbridges too closely, and the last notice of the driver exhibits him in the act of performing his duty, attending to his engine while it was slipping, and while doing this his back was towards the red light. The line is on sharp curves, and there is a steep falling incline at the New Cut bridge. This brings me to a portion of the subject on which I am frequently obliged to comment. This engine was running with the wrong end in front, where there is no shelter whatever to the men in bad weather, where they work at every disadvantage as regards attending to their duties, in connexion with keeping a good look-out; and experience has proved that they are more likely to lose their lives in the event of a collision taking place, as there is so much more difficulty and risk in jumping from these tank engines than from the ordinary tender engines. The working of the engine also is less satisfactory than when it is running with the leading end in front. Under these circumstances, I think the directors of railway companies should prohibit tank engines from running with the trailing end in front.

This line of railway was opened for traffic in July 1863, and by Act of Parliament the company is compelled to open the drawbridges and to keep them open for 2½ hours before high water and for 1½ hours after high water, for each tide. The passenger and coal traffic usually ceases about half past 8 o'clock p.m., and is resumed about 4 a.m.; but by the permission of the assistant dock master the bridges may be closed at intervals during the four hours, when the exigencies of the railway traffic require it, and the requirements of the shipping will admit of it. During the four hours the signalmen at Nos. 2 and 3 valve houses are kept busily employed, but for the remainder of their regular day's work of 14 hours the work is light. Still I should state that these hours are far too long for men performing such responsible duties; and, unfortunately, they have not been limited to 14 hours, but these men have been permitted, not actually compelled, to work over-time; so that for several days prior to that on which the accident occurred they were employed for 16 or 17 hours.

With respect to the future working of the traffic over this viaduct, I have recommended that, in order to avoid similar accidents, it shall be made impossible to send a telegraphic message between Nos. 1 and No. 4 telegraphic signal stations, except when the two drawbridges are closed, and the opening of either of the bridges will break the circuit of the telegraphic wire, and the closing of both bridges will restore the circuit.

The telegraphic instruments made use of for working the traffic are of Tyer's patent; and by their present construction a brass button is pressed to ring a bell or gong, and another rings a bell or gong, and also moves a needle from "Line blocked" to "Line clear," &c. &c. These brass buttons are precisely similar; and a signalman might easily make a mistake, and press the wrong button, and thus give "Line clear" when he only intended to acknowledge the receipt of a signal on the bell or gong.

On these grounds I think it would be expedient to

disconnect the bell or gong from the wire used for moving the needle, and thus "Line clear" or "Line blocked" would then always be given by two separate acts; the first ringing the bell or gong, calling the signalman's attention; and the second moving the needle to the words on the dial plate "Line clear" or "Line blocked."

(Railway Department),*

Whitehall, 22nd March 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North British Railway Company, the enclosed copies of reports made by Captain Tyler, R.E., on four accidents which occurred on the North British Railway in December last.

My Lords trust that the Directors will see fit to adopt the measures recommended by Captain Tyler in these reports for ensuring the public safety.

I have, &c.

*The Secretary of the
North British Railway
Company.*

W. D. FANE.

SIR,

Edinburgh, 16th March 1866.

IN compliance with the instructions contained in your Minute of the 26th February, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 20th December last at Saint Margaret's on the North British Railway.

The main line of this railway from Edinburgh to the south runs through the company's principal locomotive and carriage works at Saint Margaret's, a mile and a half to the east of Edinburgh. There are a number of sidings on both sides of the line; and those on the south, on which side the coke-store is situated, join the main line to Edinburgh in a tunnel, commonly called the coke-store tunnel. There is a falling gradient of 1 in 78 from the direction of Edinburgh to the middle of this tunnel, and the line is then level through the works. The switches are 23 yards from the eastern entrance to the tunnel, and they are under the charge of a pointsman, stationed at the western mouth of the tunnel, 46 yards from them. This man has a wire-signal working in each direction, and a bell from (but not to) the telegraph cabin, 250 yards east of him.

He was in his hut about 9.30 a.m. on the day in question, when he saw five empty coke-waggons, which he did not expect, coming round the corner of the tunnel from the coke-store, upon the main line to Edinburgh. He at once left his hut, turned his signal towards the east to "danger," walked to the siding points, and, after consulting with the pilot-guard, came to the conclusion that it would be safer to allow the waggons to run back along the main line than to turn them into the siding, as they returned by the force of gravity down the gradient of 1 in 78 above referred to.

The pilot-guard turned away to fetch the pilot-engine, and the pointsman awaited the return of the waggons, when a passenger train appeared in sight, and this train came into collision with the waggons as they were nearly at a stand, but before they had begun to run back again. The buffers of the passenger engine were broken, and the foot-plate of the tender was cracked. Three of the waggons were broken to pieces. One of the passengers was slightly injured.

The passenger train started from Berwick punctually at 6.30 a.m., consisting of an engine and tender, eight carriages, and a break-van. The engine-driver found the distant-signal from Saint Margaret's at "all right"; and he was only warned by a red flag at the telegraph cabin, as he passed it at a speed of 30 miles an hour, of the waggons being in front of him. He then did his best to pull up, and had succeeded in reducing his

speed, as he thinks, to eight miles an hour before he struck the waggons.

The signalman at the central telegraph-box received notification from Portobello of the approach of the passenger train at 9.30, and turned his signal for it to pass, as the line was clear. About 9.33 he was informed by a boy who came to his cabin that there was an obstruction on the line, and on looking out he saw the waggons near the tunnel. He showed a red flag, therefore, to the driver of the passenger train, and he observed that he was, as well as the guard, doing his best to pull up.

The waggons were brought upon the main line, in the way of the passenger train, in consequence of a misunderstanding on the part of one of the six coke-men who are employed at the coke-store, of what was said to him. It appears that the pilot-guard, who superintends the shunting of engines and waggons about the St. Margaret's yard, saw a pilot engine standing about 9.20 near the telegraph cabin, on the line from Edinburgh, ready to pass over the line to Edinburgh, towards the south sidings, at the first opportunity. This engine was intended to receive empty waggons on the line to Edinburgh, as they ran down from the coke store by the force of gravity upon that line, and to push full waggons up to the coke store; but it was then detained on the line from Edinburgh until a train had passed on the other line to Edinburgh. The pilot-guard did not know for certain that a train was approaching, but he thought it likely, because the trains were in the habit of following each other quickly at that time in the morning, and because the engine would otherwise have crossed on to the other line of rails. In order to save time, when the engine should be able to do so, he went to the coke-store, and warned the coke-man, Mackintosh, "to be ready with his waggons to get them down when the pilot-engine came across the road." He then went back to the main line, to see whether the engine was coming, and he had not gone far before he heard the waggons running down the incline.

The coke-man was aware that the waggons ought not to be let down until the engine was on the line to Edinburgh, ready to receive them; and he, or any other coke-man who performed the duty, usually waited for the engine whistle before he allowed them to go. But understanding the pilot-guard to instruct him,—not "to be ready," but "to let them down," he supposed that the engine was in its place; and he removed the chock-block, knocked the spraggs out of the wheels, and allowed them to run down. He did not then know that the signal which applied to engines might be taken to apply also to waggons passing from the sidings to the main line; and, indeed, the signal was not of the same importance in the latter case, because it was always safe to allow the waggons to run towards the main line whenever it was proper to allow the engine to be upon that line to receive them.

The best remedy that can be applied to meet this case is that which I have already referred to in another Report of this date, upon an accident which occurred at the same spot; namely, to add a pair of safety points which shall prevent anything from running out of these sidings upon the main line unless they are specially opened for the purpose by a pointsman, and to add improved signals from the central telegraph cabin, and communication both ways, by means of which this pointsman may ascertain and be informed at all times precisely what it is safe for him to do or to allow.

I have, &c.

*W. D. Fane, Esq.,
Board of Trade,
Railway Department.*

*H. W. TYLER,
Capt. R.E.*

SIR,

Edinburgh, 16th March 1866.

IN compliance with the instructions contained in your minute of the 26th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 28th December last at Saint Margaret's on the North British Railway.

The principal locomotive and carriage establishment of the North British Railway Company is at Saint Margaret's, a mile and a half from Edinburgh, with sidings on both sides of the Railway. The sidings on the south of the Railway join the line to Edinburgh in a tunnel 70 yards long, on the west of the buildings, the points being 23 yards from the eastern mouth of the tunnel. These points are under the charge of a signalman, whose cabin is 46 yards from them at the west of the tunnel, who has a wire signal working in each direction, and a bell ringing from (but not to) the telegraph cabin 250 yards to the east of him.

The pointsman who was in charge of the above cabin on the 28th December heard an engine coming whistling towards him from the sidings at 5.45. p.m., and saw, on looking eastward, that a passenger train was approaching him at the same moment on the line to Edinburgh. He turned his signal to "danger," but noticed, in doing so, that the driver of the passenger train was too close to him to receive any warning from it. The engine of the passenger train came into collision with the tender of the engine from the siding, and mounted it, and drove it forward for about 120 yards; and the funnel of the passenger engine was knocked off against the roof of the tunnel. The engine-driver of the passenger train, and six of the passengers, were more or less slightly injured.

The passenger train left Carlisle at 2.5 p.m. punctually, and approached the telegraph cabin at Saint Margaret's at 5.50, thirteen or fourteen minutes late, at a speed of 30 miles an hour according to the engine-driver, or of 35 to 40 miles an hour in the opinion of the telegraph officer. The driver found the signal at "all right" for him to proceed, but saw a red light before him in the coke-store tunnel, from the tender of the escaping engine. He did his best to pull up, but was unable to reduce his speed materially before he came into collision with this tender.

The telegraph officer saw the engine leave the sidings, and foul the main line as the passenger train passed his cabin. He had not turned "on" his siding signal, which was of an unusual description, as I shall presently explain, and the driver of the engine had no right therefore so to leave the sidings.

This driver has, I am informed, absconded; and his fireman, and a fitter who was with them, have since left the service of the Company. I had not therefore an opportunity of examining any of these men. But I learn that they had taken the engine, which was newly repaired, from the north to the south of the main line, to fetch its tender from a siding near the coke-shed; that they were trying it together; and that they were returning to the north sidings to be ready for work. The engine-driver was an experienced man, but did not know much of the working of the yard at St. Margaret's; and he told the sheriff, when examined by him, that he "thought he had got the signal" to allow him to leave the coke-sidings.

The signal employed for these south sidings, of which the principal are nine in number, is peculiar in two respects. (1.) Instead of being kept "on" at danger, according to the usual practice, when engines are not to leave the sidings, it is kept habitually "off;" and it is turned "on" with a green board by day, and a green lamp by night, by the telegraph officer from his cabin, when it is intended to indicate that an engine may leave the sidings. (2.) Instead of being placed near the points where the sidings join the main line, so as to be in front of an engine waiting to leave the sidings, it is fixed near the carriage shed at the further end of the sidings, so

that an engine-driver is obliged to look either sideways or behind him to receive its instructions. The telegraph officer has been obliged to report engine drivers for going out of these sidings without his permission on previous occasions; and he has several times suggested, but hitherto without effect, that he ought to be supplied with extra signals, because he requires to indicate to the engine-drivers, perhaps to more than one at a time, either that they may proceed to Edinburgh; or that they may shunt in and out of the sidings, and so obstruct the line to Edinburgh; or that they may cross to the north sidings, by which they would obstruct the lines both to and from Edinburgh.

The following are the signals at present made by the men to the central telegraph box, when the atmosphere and daylight will admit of it, as described in the words of one of the signalmen there stationed: "When they want to shunt on the main line only, they hold up the right arm facing the office, and whistle at the same time. When they want to cross to the north sidings, they exhibit the left arm, and whistle at the same time. When they want to go to Edinburgh, they give a long whistle, and exhibit no arm."

It is very necessary that this signal post should now be removed towards the west of the sidings, that it should be made to show "danger" when engines or waggons may not go out, and that it should be provided with extra arms and lamps to enable the telegraph officer to give the separate indications above referred to.

It is desirable, also, that a pair of safety points should be laid in on the west of these south sidings, to be worked by a pointsman in conformity with the indications of the telegraph-officer on the above improved signals; and that there should be good means of communication in both directions between the pointsman and the telegraph-officer. The main line traffic is very heavy, the view is obstructed, the amount of shunting from the sidings is very great, and the siding from the coke-store falls on a steep gradient towards the main line. It would tend greatly to safety if no engines or waggons could reach the main line unless permitted thus to do so, both by the signals of the telegraph-officer and the action of a pointsman. Other improvements might advantageously be effected in the telegraph cabin, and the apparatus connected with it, which I have indicated on the spot, but to which I need not here refer.

I have, &c.

H. W. TYLER,
Capt. R.E.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

SIR,

Edinburgh, 17th March 1866.

I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, that I have inspected the level crossing at Coatbridge of the Edinburgh and Glasgow turnpike road by the Monklands section of the North British Railway, referred to by Mr. Young in his letter of the 3rd instant.

This level crossing is a focus of enormous traffic. Mr. Baird's branch line joins the double line of the Monklands Railway, the towing-paths of two canals meet, eight roads converge upon it. There is a heavy and increasing mineral traffic on the Railways, and there are foot passengers, carts of coals or minerals, and barge horses continually passing on the roads. There is a crossing-keeper, with a wire signal to the northward, to warn the public using the roads of the approach of trains, but there are no gates or other means of protection.

I am informed by the crossing-keeper that there has been no serious accident at the crossing during the eight years that he has been in charge of it until that on the 21st December last to the poor woman referred to by Mr. Young. The crossing-keeper did not

observe that she carried (as Mr. Young states) an umbrella, but she appeared to him to be endeavouring to get across before an engine, which was approaching from the south with four waggons behind it, had passed. She was unfortunately caught in the attempt, and thrown down, and she died subsequently from the injuries which she received.

Mr. Young complains of delay as well as danger. And there appear to be grounds for this complaint in consequence of the shunting of waggons on Mr. Baird's branch, as well as from the passage of trains on the main line. The principal traffic on the roads is from foot passengers.

I recommend that a footbridge be constructed over the branch and main line, to accommodate the different roads which converge upon the crossing; that gates be provided, worked by machinery, to close the roads during the passage or shunting of the trains; and that wire signals be supplied to the south, and towards Mr. Baird's branch, to be worked with the signal to the North,—all by one improved lever.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

SIR, North Berwick, 19th March 1866.

IN compliance with the instructions contained in your minute of the 26th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 21st December last near the Linton Station on the North British Railway.

The mail train left Berwick at 9.16, 31 minutes late, and Linton at 10.46, 44 minutes late, for Edinburgh on that morning, consisting of an engine and tender, a horsebox, eight carriages, and a break-van. As it was travelling at 30 miles an hour down a falling gradient of 1 in 250, and round a curve to the right-hand of three quarters of a mile radius, a mile to the north of Linton, and $22\frac{1}{2}$ miles south of Edinburgh, the fireman observed to the engine-driver that there appeared to be something wrong with the left leading spring of the engine. The driver shut off his steam, and went forward to examine it; and he found that the "back adjusting-screw" which carried the trailing end of that spring "was broken under the top nut." He had just time to get back to the foot-plate, when the leading wheels of the engine left the rails. He then applied his break, whistled for the guard's break, and did his best to pull up; but after he had gone about 200 yards from the point at which the leading wheels appeared to leave the rails, the engine turned off to the left, against the slope of the cutting through which that part of the line runs, and turned over on its left side.

The guard who rode in the van at the tail of the train first heard the engine-whistle, and then, after applying his break, found the train brought to a sudden stand, for no cause that he could see. He was thrown

forward in his van, without injury. On getting out, he found the horse-box, one third class, one second-class, and one first-class carriage, all off the rails, as well as the engine and tender. The tender rested on its left wheels across the ditch at the side of the line. The horse-box also leant over to the left, as well as the third-class carriage. The other vehicles remained on their wheels in an upright position. The driver and fireman were slightly injured, and were off work for a day; and a mail-guard was hurt. But the passengers escaped without injury.

The permanent way was laid with double-headed rails, weighing 70lbs. to the lineal yard, in lengths of 16 feet, not fished at the joints. The chairs, of cast-iron, weighed 22lbs. at the joints, and 18lbs. each in the intermediate spaces. The sleepers, inserted $3\frac{1}{2}$ years ago, were laid transversely, 3ft. 9in. apart on the average. The line has been relaid since the accident, with new rails of the same weight, fished at the joints; and with chairs weighing 33lbs. each, secured by hollow spikes to square creosoted Baltic sleepers, 10 in. $\times$ 5 in. in section, and placed at an average distance of 3 ft. $1\frac{1}{4}$ in. apart. I am glad to find that it is intended to relay the other line of rails, which is 19 years old, with as little delay as possible.

An examination of the permanent way after the accident showed that all the chairs were broken on the outside of the curve, and that the rails on that side were much bent for the 200 yards that the leading wheels of the engine seem to have been off the rails, while the inside rails remained undisturbed, and none of the chairs under them had been fractured. Three or four rails were thrown out when the engine turned to the left against the slope of the cutting.

The engine was a *single* passenger engine, with 16 in. cylinders, and a stroke of 20 inches. The leading and trailing wheels were 3ft. 9in. and the driving-wheels 6 feet in diameter. The wheel-base measured 15ft. 3in. from the leading to the trailing axles, and there were 8 tons on the leading, 12 tons on the driving, and 5 tons on the trailing wheels when the engine was in running order. The bearings on the leading and trailing wheels were outside, and on the driving wheels inside. The engine has since been running in an unaltered condition, except that all the other adjusting screws, similar to that which failed, have been wisely renewed with round threads instead of square threads, which they had at the time of the accident, by way of adding to their strength.

This accident was no doubt occasioned by the fracture referred to of the adjusting-screw of the engine-spring, which may have been partly caused by the rough condition of the permanent way before its renewal.

I have, &c.

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 3d February 1866.*

SIR,

I AM directed by the Lords of the Committee for Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred between a passenger train and a goods train, at the Chapel Town Station on the 13th ultimo.

I have, &c.,
W. D. FANE.

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

SIR, *Manchester, 31st January 1866.*

IN compliance with the instructions contained in your minute of the 17th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 13th instant, between a passenger train and a goods train, at the Chapel Town Station, on the Bolton and Blackburn section of the Lancashire and Yorkshire Railway.

This station is about $4\frac{1}{2}$ miles to the north of Bolton, and is approached from the south on a rising gradient of 1 in 75. There is a bridge over the line, 180 yards south of the up passenger platform, and the line being curved and in a cutting, the view of an engine driver is much obstructed. There are no platform signals, but there is a distant signal in each direction, that towards the south being on the slope of the cutting and north of the above bridge, so that the view of it is obscured by the bridge for some little distance.

On the day in question, the 8 a.m. passenger train from Manchester and Bolton approached Chapel Town, according to the engine driver, at 9·2, six or seven minutes late, composed of an engine and tender, four carriages, and a break van, the carriages and van having been coupled together with Fay's continuous breaks. The engine driver found the signal at all right, and was running forward with his steam on towards the down platform, when he suddenly saw a pilot engine "about thirty yards" in front of him. He shut off his steam, reversed his engine, and whistled for the breaks; but he came into collision with the pilot engine at a speed which he estimates at seven or eight, and the guard at ten miles an hour.

The shock was a sharp one. The guard, who had time fully to apply his breaks, was thrown down in his van and hurt in the side, and he has not yet been able to return to his work; but the engines were only slightly damaged, and fortunately only two passengers appear to have been injured. This result is attributable, partly to an effort made by the driver of the pilot engine to run forward, and partly to the steepness of the gradient; but principally to the action of the continuous breaks which the Lancashire and Yorkshire Company so wisely employ, and which, upon this occasion, prevented any violent rebound of the buffers from occurring after the collision, besides lessening the original shock to the passengers in each vehicle.

The pilot engine was standing about thirty yards to the south of the down platform, at the tail of a goods train which it had been assisting up the incline. This goods train consisted, when it reached Chapel Town, of an engine and tender (besides the

pilot engine), 25 waggons, and two break vans. Three of these waggons, the third, fourth, and fifth, were to be left at the station, and the train was brought to a stand at the down platform, to allow the engine and tender to go forward with the five leading waggons, to the points through which they were to be turned across the up line into a siding.

This train reached Chapel Town at 8·55, according to the head guard in charge of it, or 9 o'clock, according to the station master. It was $3\frac{1}{2}$ hours late, of which time 1 hour and 40 minutes had been lost on its last trip, at Bolton, in waiting for the pilot engine, and the remainder in shunting. As the passenger train was due to leave Chapel Town at 8·56, it was actually due to arrive at that station when the goods train drew up to the platform on the same line of rails; and it would appear that the goods train must have then been left unprotected by the signal for six or seven minutes before the collision occurred.

The station-master was engaged in the booking office when the goods train arrived, and only ran out "about half a minute afterwards" to see the collision occur, after hearing "three sharp whistles" from the passenger engine.

His staff consisted of a passenger porter, a goods porter, and a telegraph boy.

The goods porter was away ill, and had been so for a week; and the telegraph boy was only due to arrive by the passenger train. The passenger porter, Jacob Downes, who alone remains, was in charge of the signals; but he was "100 yards north" of the station, letting down 12 or 14 coal waggons "from the north end of the coal siding to the south" of that siding, to make room for waggons brought "by the 5·20 Bolton (goods) train." He was, in fact, doing the goods porter's duty, and was thus prevented from attending to his signals. Unable to leave the coal waggons, he called out to a platelayer, who had given him occasional assistance during the previous week, and was then near the signal handles, to "put the signals on," and he had no doubt that he would do so. He heard the north signal turned on, and afterwards the crash of the collision while he was fastening down the breaks of the coal waggons.

The platelayer referred to, Ralph Kay, was engaged in scraping snow off the down platform when the goods train arrived. He neither saw nor heard anything of the passenger porter, Downes; but the head goods-guard came running past him and said "They're going across, put on the up (north) signal." After he had turned that signal to danger, he looked round and "saw a passenger train coming, which ran into the goods train." It was then of course too late to apply the south signal.

The head goods-guard knew on his arrival that the passenger train was due within a minute, and after applying his break, he jumped out of his van,—told Kay to apply "the up line (north) signal,"—saw him turn towards the handle of the down line signal, and thought he was going to turn that signal to danger,—and then ran forward to assist his 2nd guard in getting the waggons across. He states that he was unable to shunt his train out of the way of the passenger train, because the coupling was unhooked, and the engine and five waggons had gone forward to cross to the up line before he could, after applying his break, get out of his van. This is contradicted by the 2nd guard, who saw the head-guard out of his van after he had uncoupled the waggons, and before he moved forward with them; and, indeed, the head-guard stated himself, when

recalled, that he did not know where the waggons were when he first left his van. But it is clear that the train was divided, the engine and five waggons were sent forward, and the remainder was left standing in the way of the passenger train, not only without leave from any one in charge of the station, but also without any one being present to see that the south signal was turned to danger. The engine and three waggons are stated to have been on the crossing, in motion towards the siding, into which two waggons had entered when the collision occurred.

The singular independence which was thus displayed by the goods guard is, perhaps, partly to be accounted for by the extraordinary mode of working which is practised on this part of the line during the night, when passenger trains are not running. From 10 p.m. to 3.20 a.m., the goods trains do not stop at any station except where there is a watchman; but from 3.20 a.m. to 6.30 a.m. they stop at those stations where there is no watchman, Chapel Town amongst the number; and the guards then do all the station work themselves, attending to the signals, the switches, and the scotch-blocks.

The telegraph is employed by day, but not by night, for working the traffic on this line. But there is only a single needle instrument on the "magnetic" system, without a bell, at Chapel Town, and the wire on which it works is continuous from Bolton to Blackburn. The trains are telegraphed after they have started to Bromley Cross ($1\frac{1}{4}$ miles) on the south, and to Entwhistle ($1\frac{3}{4}$ miles) on the north, for information only, to announce their approach. Neither the goods train nor the pas-

senger train was, however, telegraphed on the present occasion, because, as I have already stated, the telegraph boy was only due to arrive by the latter, from his home, which was some miles to the southward.

There are many improvements wanting on this line, and at this station, amongst the principal of which I may mention;—(1.) Shunting sidings generally. The goods train could only on this occasion have been shunted, if at all, from one main line to the other. (2.) Platform signals generally, and at Chapel Town the south signal to be moved to a greater distance, and a second north signal to be provided, for the protection (on a falling gradient of 1 in 75) of points about 300 yards from the station. (3.) Telegraph bells, with up and down instruments, separate wires as well as a through wire, and a better system of telegraph working. It is desirable also, that instruments and bells should be provided at King William, the next goods station south of Chapel Town. (4.) The employment of night inspectors at all stations where work is done by trains during the night.

I should explain, in conclusion, that the station-master at Chapel Town had made no report to his superiors of the absence of his goods porter, expecting him to return to work almost daily, and believing that he could, with occasional assistance from a platelayer, do without him in the meantime.

I have, &c.

*The Secretary of the
Board of Trade
(Railway Department),
Whitehall.*

H. W. TYLER,
Capt. R.E.

LONDON, CHATHAM, AND DOVER RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 9th February 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London, Chatham, and Dover Railway Company, the enclosed copy of the report made by Capt. Rich. R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the accident which occurred to a goods train from the falling of an under bridge near Beckenham on the 14th ultimo.

I have, &c.

W. D. FANE.

*The Secretary of the
London, Chatham, and Dover
Railway Company.*

SIR,

Dulwich, 5th February 1866.

IN compliance with your minute of the 18th ulto., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances, that caused the accident, that occurred on the 14th January 1866, in consequence of a bridge on the London, Chatham, and Dover Railway, near Beckenham, having fallen.

A goods train, consisting of an engine and tender, a guard's van, 30 goods trucks, and a second guard's van at the tail of the train, left Stewarts Lane at 1.30 a.m. for Ramsgate.

It passed Penge Junction, at a speed of about 12 miles per hour, at 3.54 a.m. When the train reached the bridge over the Chaffinch stream, which is about 120 yards beyond Penge Junction, the signalman in the junction box heard a great crash, which was the noise made by the bridge and a part of the train falling into the stream. The bridge consisted of two openings, one of 14 feet, over the stream, and the

other 18 ft. wide, over a kind of field road, or cattle track, on the bank of the stream.

The abutments, which were 3 ft. 9 in., besides counterforts, and the centre pier, which was 3 ft. thick, were built of brick. The girders were cast iron, each rail was carried on a longitudinal timber, bolted between two cast iron girders.

Half the bridge, which carried the down line, fell whilst the engine was passing over it. A goods train had passed over the same line about an hour and seven minutes previous. The foreman of platelayers had passed under the bridge at 4 o'clock on the previous afternoon; the signalman had passed over it at 9 o'clock the same evening; and neither of them perceived anything wrong. The stream, which is usually about 1 ft. deep, and 2 or 3 ft. wide, was swollen with the water from the southern side of Sydenham Hill, which flowed from it in torrents, caused by the melting snow. The signalman stated, that the whole plain was covered with water to a considerable depth; that both openings of the Chaffinch bridge were very full, and that the water was rushing through them with considerable velocity. He added that during the 16 years that he has lived in the neighbourhood, he has seen nothing like the flood, and his description does not appear to be exaggerated.

At the north side of the same hill the rush of water was very great.

The swollen stream under the Chaffinch bridge undermined the western abutment at the north end, and the northern half fell, under the weight of the engine of the goods train, which struck the centre pier in its fall, and carried away the northern portion of it.

One of the buffers left its mark in the eastern abutment of the bridge, and the engine was turned over on its side in the cattle pass on the right bank of the stream. The tender lay in the stream, and the

unfortunate fireman was crushed to death under the framing. The driver escaped with slight injury. The van next to the tender, was turned upside down, and the guard in it was somewhat hurt. Fourteen goods trucks were heaped one over the other in the stream and on its banks. The other 16 trucks remained on the rails above. The bridge seems to have been fairly built, but the foundations, which were laid on a bed of hard marl mixed with stone, forming a species of natural concrete, were not sufficiently deep below the bed of the river. The foundations of the abutment which fell, appear to have been originally laid about 3 ft. 6 in. below the bed of the stream. But the stream, according to the evidence of the signalman, (which is borne out by the original drawings in the possession of the engineer, there being no copy

amongst the plans in the Board of Trade office), was straightened and deepened about 2 ft. by the landlord some years since. This deepening left the bed of the river only about 1 ft. 3 in. above the foundations. The banks were sloped at an inclination, of about 2 feet horizontal to 1 foot vertical, and sodded. They do not appear to have moved till the flood of the 13th; but this shape, which is not natural, and is never seen on the natural banks of any stream, should not be adopted, unless the bottom is pitched, or an invert arch is put in.

I have, &c.
F. H. RICH,
Capt. R. E.

*The Secretary of the
(Railway Department),
Board of Trade.*

LONDON AND NORTH-WESTERN AND MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAYS.

*Board of Trade
(Railway Department),
14th February 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-Western Railway Company [Manchester, Sheffield, and Lincolnshire Railway Company] the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the falling of the roof of the joint railway station of the London and North-Western, and Manchester, Sheffield, and Lincolnshire Railway Companies, at London Road, Manchester, on the 22nd ultimo.

I am &c.,
W. D. FANE.

*The Secretary of the
London and North-Western
Railway Company.*

*The Secretary of the
Manchester, Sheffield, and Lincolnshire
Railway Company.*

78 feet, in two spans of 78 feet $5\frac{3}{4}$ inches, and in two spans at the east end of 88 feet $4\frac{1}{4}$ inches each. The whole was to be supported on longitudinal girders, resting on cast-iron columns, with a total height of 60 feet, and a height to the lower side of the girders of 25 feet; and it was to be covered alternately with slates and glass. The principals averaged on the longer longitudinal spans 14 feet 8 inches from centre to centre, and were assisted by intermediate bearers. The area of each division between the principals was, therefore, 94 feet 3 inches $\times$ 14 feet 8 inches = 1,381 superficial feet. The weights were to be as follows:—

	Cwt.
Ironwork in principal, including intermediate bearer, pur- lins, &c. - - -	138
Covering, including	
Boarding at $4\frac{1}{2}$ lbs.	
Slates at $7\frac{1}{2}$ lbs.	
Glass and sashes at $2\frac{1}{2}$ lbs. -	112
	250 = $12\frac{1}{2}$ tons.

And $\frac{12\frac{1}{2} \text{ tons}}{1,381} = 20 \text{ lbs. per foot super. due to the}$

weight of the structure.

It was also calculated that if a further 20 lbs. per foot super. were added for pressure of wind, a total weight would be arrived at of 40 lbs. per foot super. over the whole structure. And $1,381 \times 40 = 55,240 \text{ lbs.} = 24.66 \text{ tons}$, would, as regarded the transverse spans, be the total weight of and to be supported by each principal where the principals were 14 feet 8 inches apart, of which half was for the actual weight of the materials.

Tenders were received for the construction of the roof, on Mr. Dempsey's design, on the 12th of February 1864, from Messrs. Fairbairn, Messrs. Mabon, the Horsley Iron Company, Messrs. Rankin, and Messrs. Ormerod and Co., the amounts of which were unusually near to each other; and the tender of Messrs. R. and J. Rankin and Co. was accepted on the same date for 35,799*l.*, from which 1,600*l.* was to be deducted as the value of the old roof.

As this was a joint work, Messrs. Mills and Murgatroyd, architects, of Manchester, who were already employed in building the new station, were appointed also, on the recommendation of Mr. Sacré, agreed to by Mr. Baker, to superintend the erection of the roof, in order that direct responsibility might be obtained. This was the more desirable because Messrs. Mills and Murgatroyd had already been carrying out extensive works for strengthening the arches of the viaduct upon which the whole structure was to be raised, and similar care was necessary in preparing the foundations for the columns of the roof.

SIR,

Manchester, 7th February 1866.

IN compliance with the instructions contained in your minute of the 24th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 22nd ultimo, at Manchester, from the fall of the roof at the London Road joint station of the London and North-western, and Manchester, Sheffield, and Lincolnshire Railway Companies.

The question of a roof for this station appears first to have been seriously entertained in the autumn of 1862 and the beginning of 1863. At that time Mr. Sacré, the engineer of the Sheffield Company, advocated the adoption of a single span, while Mr. Baker, the engineer of the London and North-western Company, preferred a double span. Mr. T. Harrison, to whom the matter was referred, reported in favour of a double span, and Mr. Dempsey, of Great George Street, London, was, on the recommendation of Mr. Baker, agreed to by Mr. Sacré, directed to prepare the quantities and drawings for the work.

Mr. Dempsey prepared detailed drawings accordingly, towards the end of 1863, of which the enclosed tracings will serve to show the general design. The roof over the passenger platform was to be transversely in two spans of 94 feet 3 inches each; and longitudinally, commencing from the west end, in three spans of 77 feet 10 inches each, in one span of

The original plans of Mr. Dempsey, signed by Mr. Baker and Mr. Rankin, were handed to Mr. Murgatroyd in November 1864, and tracings from them, signed by Mr. Baker and Mr. Sacré, were supplied to Messrs. Rankin. Messrs. Rankin ordered the iron (through a broker) from the Blaenavon Iron Company, and commenced work in November 1864.

During the progress of the works, Mr. Murgatroyd, on whom the duty of superintendence for the Company personally devolved, "spent the greater part of" the forenoon upon them, never less than three "times a week;" and, with the following exceptions, the work was carried out in conformity with the drawings. In January 1865, Mr. Murgatroyd made a suggestion to Mr. Sacré as to strengthening the girders down the middle of the roof, to which Mr. Sacré acceded, and Mr. Murgatroyd went to London to see Mr. Baker on the subject. Mr. Baker assented, and the side girders were weakened to strengthen the centre girders. Where the side girders were supported for the shorter spans by the side walls of the station, the top plates of those girders were transferred respectively to the top and bottom flanges of the corresponding central girders; but where, as in each of the 88 feet 4 inches spans, there was only one side wall, the top plates were taken from those girders only which were so supported, and transferred to the central girders, while extra plates were provided for the lower flanges of those girders, 13 inches by $\frac{1}{2}$ inch over their whole length.

The only other important alterations from the drawings were, in making the pitch of the skylights somewhat steeper, in connecting the side columns with the side walls, and in varying the ornamental portions of the pillars, which were all agreed to at the same time; and subsequently in a different arrangement of the metal for the struts of the principals of the roof, to avoid practical difficulty in casting them hollow.

Mr. Henry Rankin informs me that his brother made some remarks verbally to Mr. Murgatroyd, in regard to the cast-iron connections between the columns and the girders; but Mr. Murgatroyd has no recollection of any such remarks, and feels sure that if they had been made, they would have received his careful attention. Mr. Rankin adds, "they were" not insisted on, and we were not uneasy on the "subject, though we did not quite like the means of" connection."

During the progress of the work, the deflections of the middle girders, of which I enclose a statement, were taken by Mr. Measures, the foreman of the contractors. It appears from that statement that the centre girders from No. 1 to No. 6 longitudinal spans, had permanently deflected to amounts varying from 3 inches up to even $4\frac{1}{2}$ inches; while No. 7, the centre girder that fell, had deflected $2\frac{3}{4}$ inches on the 12th January, 10 days before it fell. No later observation was taken, but the deflection must have increased after that time. Mr. Henry Rankin states, with regard to the evidence of weakness shown by those deflections, that, though he did not see any immediate cause for apprehension, his firm had become convinced that with a view to permanent stability "something was necessary to counteract it." He had not, however, said anything to Mr. Murgatroyd on the subject, and Mr. Murgatroyd himself appears to have been satisfied at observing that from November 24th, when the greater number of the girders had been fully loaded, up to the 12th January, when the deflections were last taken, hardly any perceptible change had occurred.

I learn from Professor Airey that the highest pressure recorded at the Greenwich Observatory from the strong winds which prevailed in the early part of January was $33\frac{1}{2}$ lbs. to the square foot on the 8th January. They do not appear to have had any observed effect upon No. 7, the 2nd longitudinal span from the east end, but the central portion of the upper flanges of the three girders of No. 8,—the last span at that end, were all buckled over slightly to the northward. Mr. Measures' attention was called to this by his assistant, Furniss, "one Saturday

"morning, at least three weeks before the roof fell." He at once drew the girders back into their proper positions, by means of three chains attached to the rails of the permanent way and to the north girder, and shored them up; and he did not notice any further movement in them. Ten days afterwards, he mentioned to Mr. H. Rankin, when he inquired as to the effect of the wind, that the girders had shifted, and he also mentioned that circumstance to Mr. Walker, Mr. Murgatroyd's clerk of works, but he did not think it serious at the time, or that it need be mentioned to Mr. Murgatroyd; and Mr. Murgatroyd informs me that he heard nothing of it till the roof had fallen.

Mr. Moorsom, however, the joint engineer of the two companies, though he had nothing to do with the erection of the roof, remembers seeing Mr. Measures on the passenger platform at the station on Saturday the 6th of January, and hearing from him on that day "that the wind had sprung one of the" girders, and that he had some men at work shoring "it."

All appeared to go on as usual from that time until Monday, the 22nd January, when No. 7, the last longitudinal span but one to the east, fell to the ground about 2 p.m., covering two engines and some passenger carriages with the debris, and injuring 31 workmen and others, of whom two have since died. Mr. Murgatroyd was about leaving his office to see whether a severe gale of the previous Saturday night had done any harm to it. Mr. Measures had been under it an hour or two before, and would not believe that it had fallen. The middle girder of this span was seen to fall first, and the transverse roof spans on each side of course followed on being deprived of their central support. The longitudinal spans on either side were left standing. The north (outside) girder of the span that fell remained attached to the columns, and on the wall, while the south (outside) girder of that span, which had no wall under it, was dragged away from its columns.

But these were mere results, and in describing the cause of failure, it is necessary that I should now direct attention more particularly to the central girder and its connections with the columns east and west of it.

This was a parallel girder 88 feet 4 inches long, and 6 feet deep, with diagonal braces and vertical struts, as shown in the accompanying drawing. The vertical struts, as well as the ends, were of cast iron, and the remainder of wrought iron.

The braces formed an angle of about 25 degrees with the flanges, and were more than $2\frac{1}{2}$ times as long as the vertical struts. Careful calculation, from the quantities claimed by the sub-contractors from the principal contractor as having been fixed, and investigated by Mr. Murgatroyd, shows that there was a total weight of materials, workmen, and scaffolding amounting to 70 tons upon this girder when it failed, besides its own weight of 15 tons, making a total weight of 85 tons. These weights were somewhat in excess of those estimated for, though nearly in accordance with the plans furnished by Mr. Dempsey, and the above amount was 15 tons less than the girder would have had to support when the roof was completed. There would then have been a total load of 100 tons, or rather more than $16\frac{2}{3}$ tons on each of the vertical struts in the girder. Under this latter weight, the strain per square inch on the effective area of the upper flange may be estimated, without deducting for rivet holes, at rather more than 4 tons; on the lower flange, deducting rivet holes, at $5\frac{1}{2}$ tons; on the end braces at 8 tons; on No. 2 braces at 6.8 tons. The strains upon the other braces would similarly have been 3 tons per square inch; on the end struts (of cast iron) 50 tons each, or $3\frac{1}{2}$ tons per square inch; and on the other vertical struts nowhere more than 3 tons per square inch. In these strains no allowance is made for the effect of wind or snow, and to meet those contingencies they should, in calculation, be increased by rather more than one-sixth,

The strain on the principals for wind and snow might indeed fairly be taken at 20 lbs. to the superficial foot over the whole structure; but for the vertical strain in the girders, 15 tons for each girder, or 3 tons per vertical strut, should suffice. This would bring the total maximum strain per square inch up to 5 tons for the upper flange, $5\frac{1}{2}$ tons for the lower flange, $9\frac{1}{2}$ tons for No. 1 tension bars, 8 tons for No. 2 tension bars, $3\frac{1}{2}$ tons for the middle bars.

The position and appearance of the girder as it lay on the ground showed clearly what were its weak points, and, to my mind, at which end it had first failed. It had, in falling, moved westward. At its west end, the upper flange lay over to the southward, and rested against the base on the north side of the column on which it had been supported. A considerable bulge on the south side of that flange had evidently been the result of a severe blow against the column; and there were marks on the column itself, where the flange had grazed it and struck the mouldings as it fell. The appearance of both flanges, and the fact that the whole girder had moved westward, proved that this was not the end that first came to the ground, and that it was not the end which had first given way. The cast-iron strut at this end of the girder was torn away from the four lugs by means of which it had been bolted to the column, and these lugs remained attached by their bolts to the column after its fall.

The upper and lower flanges of the girder, though they had suffered in the fall, were nowhere distorted in the one case, or severed in the other, in such a manner as to afford indication of their having by their failure, in buckling or tearing asunder, contributed to the fall of the girder. And though the vertical cast-iron struts were more or less fractured, yet the position of the braces and of the flanges with regard to each other showed that the accident had not been caused by any failure of the bracing.

The east end of the girder presented a very different appearance from the west end. Both the upper and lower flanges, but particularly the latter, had fallen to the ground at a sufficient angle to bend them to a considerable extent; and there was this remarkable difference between the two ends, that whereas at the west end the cast-iron strut was torn away from all its four lugs, and the shoulders of that strut remained complete in the upper and lower flanges; at the east end, on the contrary, the whole strut remained attached by its lugs, *in situ*, at the top of the column, and the shoulders of the strut had been fractured in the upper as well as in the lower flange.

These fractures, of which the form is shown in the enclosed tracing, from an enlarged side elevation, are not such as would in my opinion have been produced by any ordinary strains of the end brace, though the vertical pressure upon the struts, which amounted to between 40 and 50 tons, and which might, more or less, have been carried by the pins which passed through them, according to the amount of bearing taken by the angle irons of the girder, may have had much to do with the accident; or these pieces of cast-iron might have been cracked, confined as they were tightly between the angle irons of the girders, by a slight twisting of the column, when the girders of

the end span were blown over, as I have described, to the northward, at the same time that this particular girder was also subjected to the influence of the wind; and I find, somewhat in corroboration of this supposition, that the column itself, which was rather thinner on one side than on the other, was discovered after the accident to be cracked on the thinner part of its circumference. The column was completely severed at this crack when it was afterwards pulled down.

Having regard to the facts above described, and to the general appearance of the girder, I am of opinion that the shoulders of the strut at the east end of this girder may have been fractured by the slight twisting of the column, combined with high vertical pressure, during the high winds early in January, perhaps 16 days before the fall of the roof. The upper flange of the girder and the angle irons would then have been carried on the head of the strut only, which would account for the fracture observable in the angle-iron and upper plate; and the pin which passed through its angle-iron, and through the shoulders of the strut, would have been on an inclined plane. The plates at the bottom of the girder would only have been resting for $1\frac{1}{4}$ inches at the edge of the capital of the column, and the girder would, on this supposition, have been during the fortnight in question in a precarious condition. Its only means of longitudinal attachment to the column, through the shoulders referred to having failed, it would have had a tendency, as soon as the deflection increased to a sufficient extent, to slide with its lower flange off the capital of the column, and with its upper flange off the top of the strut, the pin through the shoulder of the strut falling down the inclined plane which the fracture already described had left. I may add that the fracture of these shoulders, which occurred between the angle-irons of the upper and lower flanges, would not have been observable from the exterior, and that the closest scrutiny would probably have hardly discovered any movement to indicate their fracture until the girder fell.

The particular defects which led, then, to the fall of the roof, were, first, the employment of cast-iron struts and connections at the ends of the girder, and secondly, the narrow bearing on which the girder was supported on the capital of the column; and it appears to me that the employment of cast-iron, not only at the ends but also in the other vertical struts of the girder, was an undesirable mode of construction. I am of opinion, further, that the girder was not, even after it had been strengthened by the addition of plates to its flanges, sufficiently strong for the duty it had to perform. Its braces still remained as they were originally designed, and thus became considerably weaker in proportion than the flanges, and there was a want of lateral stiffness for so long a girder.

I may add that the remaining girders have been propped by timbers to render them temporarily secure, and that they are to receive extra permanent support, and improved longitudinal connections, with as little delay as possible.

I have, &c.

H. W. TYLER,
Capt. R.E.

MIDLAND RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 20th February 1866.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Midland Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the fatal accident which occurred, on the 18th January, to Mr. B. Shillito, at the Normanton Station of the Midland Railway.

I am, &c.

*The Secretary of the
Midland Railway
Company.* W. D. FANE.

SIR, *Whitehall, 15th February 1866.*

I HAVE the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the fatal accident that occurred on the 18th ultimo to Mr. B. Shillito, at the Normanton Station on the Midland Railway.

There are at Normanton, as will be seen by the enclosed tracing, two passenger platforms, which are connected with the hotel by a foot-bridge, and, the only safe and proper approach to the station is over that bridge, inasmuch as the platforms are surrounded by lines of railway. The passengers, therefore, to and from Altofts should pass round the road marked B B B along a diversion, also shown, which has been carried out, and which is about 220 yards longer than the road which they formerly used, marked D D D. Before the railway was constructed there was a foot-path somewhat in the direction of the dotted red line A A A, and this route (across the railway) has been used by foot passengers between Altofts and the station for many years past. On the 17th of January, the day before the accident, three notice boards were posted up in conspicuous positions, on which it was stated that "trespassers would be prosecuted with the utmost rigour of the law," but no means were taken to enforce the warning thus conveyed.

On the 18th January, Mr. Shillito, a farmer residing near the station on the Altofts Road, had been out with another farmer, Mr. Lacey, in search of dogs not returned for taxation, and they left the Station Hotel, according to Mr. Lacey, about 9 o'clock in the evening, on their return home. They took, the one a glass of beer and the other a glass of spirits, in the refreshment room in passing, and they left that room at 10.10 p.m., after remaining there 10 minutes, (according to the young woman employed there), to cross the railway by the route marked A A A in the diagram.

They would, after crossing six lines of rails, have reached the cart-road from the goods yard to the main road; but there is evidence that they were not sober; and about 50 yards from the platform, and the same distance from the engine-shed, they were knocked down by some waggons which were being shunted from the down passenger line to the turn-table siding. Mr. Shillito was unfortunately so much injured that he only survived for a quarter of an hour, and Mr. Lacey was also much hurt.

They were not seen by any servant of the Company

before the accident. The waggons, seven in number, were being pushed by an engine from behind, and the goods inspector saw one of them jump. He showed a red light to the engine-driver to stop the train, thinking the waggon had left the rails. On going to ascertain what had happened he found Mr. Lacey on the ground near the seventh waggon, and Mr. Shillito lying under the fourth waggon.

The goods inspector states that he has allowed persons to pass in that direction when they have been sober, but has taken them back, sometimes three or four of a night, when they have been intoxicated.

The population of the Altofts district is stated at 1,600 to 2,000, and the station-master believes that there are 30 or 40 railway passengers to or from that district, including both directions, daily, increased to perhaps upwards of 50 on Wednesdays, 100 on Fridays, and 150 on Saturdays.

There is also a Post Office and Money Order Office at the station, while there is no other Money Order Office in the Altofts district. The difference in distance between the footpath route A A A and the new road B B B for passengers going to the station from Altofts is 693 yards; and the difference between the former road and the diverted road is, as above stated, about 220 yards.

The Midland Railway Company are about to make extensive alterations and improvements at this station, which have already been too long delayed. These will render it more difficult than before to provide any means of approach in lieu of the ancient footpath from the Altofts side of the line to the passenger platforms,—one of which is to be done away with while the other is to be extended. I found on the spot that the inhabitants of Altofts, represented by the jury before whom the circumstances connected with the death of Mr. Shillito were investigated, were exceedingly anxious to obtain a better means of approach to the station, at the same time that the Company saw no way of affording it to them. After carefully considering the subject, I suggested that a footway of which the direction is shown on the tracing by a broad red line C C C should be constructed, skirting the proposed extensions of the Company, and necessitating a foot-bridge about 150 feet long across the corner of a building marked N. This proposal was accepted by the jury, and I have since learnt that it has also been agreed to by the engineer of the Company.

It is desirable that such a footpath should be constructed with as little delay as possible, and that the public should not only be prohibited, but also prevented from using the dangerous route A A A.

In regard to the death of Mr. Shillito, it is clear that he had no right to cross the lines of railway as a railway passenger, because he had not travelled upon the railway on the day in question, but he may have had a right to cross those lines if in doing so he can be considered to have been upon the ancient footpath to which I have referred.

I am glad to learn that a row of 26 cottages, inhabited by men, women, and children, and marked K K K in the tracing, is to be destroyed, as the only means of access to them is across the lines of rails.

I have, &c.

H. W. TYLER,
Capt. R.E.

*The Secretary
Board of Trade

MIDLAND RAILWAY.

*Board of Trade
(Railway Department),*

SIR, *Whitehall, 19th February 1866.*

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Midland Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred, on the 19th ultimo, on the Midland Railway at the Long Eaton Junction.

I am, &c.

W. D. FANE.

*The Secretary of the
Midland Railway
Company.*

SIR, *Whitehall, 16th February 1866.*

IN compliance with the instructions contained in your minute of the 29th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 19th ultimo, at the Long Eaton Junction on the Midland Railway.

This junction, between the Erewash Valley Railway and the line to Nottingham, is about 10 miles to the east of Derby, and half a mile to the east of the Trent station. It is provided with a junction stage and two double semaphore signals, besides distant signals. There is a telegraph-bell to Nottingham, which was specially provided for convenience in working the Nottingham goods yard, and is regularly employed to announce the approach of engines or trains to Nottingham, besides being used from Nottingham, (though this was not intended) to announce special trains in foggy or misty weather.

At 8.1 a.m. on the morning in question, a train of empty waggons approached the junction from Nottingham for the Erewash Valley, at the same time with a passenger train from Mansfield by the Erewash Valley, and a passenger train from the Trent station. The signalman lowered his signals first for the empty waggon train, which was first in sight, and next for the passenger train from Mansfield, leaving his signals at danger against the train from the Trent station. He naturally expected that the last-mentioned train would stop short of the junction, in obedience to his signal; but the engine-driver of that train, who had "just pulled up," applied his steam again as soon

as the empty waggon train had cleared the junction, and his engine came into collision with the tender of the engine from Mansfield.

The engine and tender of the train from the Trent were thrown off the rails with all their wheels, but no other vehicle left the rails. None of the passengers were injured.

The train from Mansfield consisted of an engine and tender, a break-van, four carriages, and a second break-van; and it left that station punctually at 6.45 a.m. The engine-driver found the signals lowered for him at Long Eaton in answer to his whistle. When he was "40 or 50 yards from the junction," and as the empty waggon train "cleared out" of the way, he saw a passenger train from the Trent also approaching, at a speed which would prevent it from being stopped short of the junction. He reversed his engine and turned on his steam at the same time that the guard applied his break, and he thus stopped his train in time to prevent the engine of the Trent train from striking any of his passenger carriages.

The Trent train consisted of an engine and tender, a break-van, and two carriages, and left that station punctually at 8.1 a.m. The engine-driver found the distant-signal from the Long Eaton Junction at danger, and he therefore "shut off his steam, and proceeded cautiously towards the junction." He saw the empty waggon train passing the junction, and as soon as it had run clear he moved forward, not observing that the passenger train from Mansfield was advancing on the other side of it. He states that the steam from the engine of the empty waggon train partly obscured the signals, and he thought that a signal which he saw lowered at the junction stage was intended for him to proceed. When he afterwards tried to pull up on seeing the Mansfield train, he was unable to do so.

This accident was caused solely by a mistake, then, on the part of the engine-driver of the Trent train.

It is desirable, in my opinion, that a complete locking apparatus, telegraph instruments, and bells in each direction, and a signal for two sidings west of the junction should be added. But it appears that the above sidings are not often used, and the accident was not caused by the want of any of these appliances.

I have, &c.

H. W. TYLER,
Capt. R.E.

*The Secretary
Board of Trade,
Whitehall.*

NORTH BRITISH RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 27th March 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North British Railway Company, the enclosed copies of the reports made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collisions which occurred on the 9th and 18th January and 23rd February at the Riccarton Junction at Bathgate, and at a point between the Avonbridge and Slamannan stations of the North British Railway.

My Lords trust that the Directors will give Capt. Tyler's recommendations their careful consideration.

I am, &c.

W. D. FANE.

*The Secretary of the
North British Railway
Company.*

SIR *Melrose, 14th March 1866.*

IN compliance with the instructions contained in your minute of the 26th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 9th of January last at the Riccarton Junction on the North British Railway.

The Border Counties branch, on which the line is single, joins the main line of the "Waverley Route," between Edinburgh and Carlisle, at Riccarton. But there is only one passenger platform for the arrival and departure of the trains to and from Edinburgh, Carlisle, and Newcastle; and the traffic is worked round that platform under arrangements, which it became my duty to describe, after inspecting the second line of rails south of Riccarton, in my report of the 23rd Sept. 1864, and in a subsequent minute, dated 12th Oct. 1864,—against which I then expressed a strong opinion,—and which I still consider to be very objectionable.

The 12.30 p.m. passenger train from Edinburgh for Carlisle reached Riccarton at 3.20 p.m. according to the record book of the station-master, or 3.14 according to the time bill of the guard, whose time is probably more reliable, on the 9th January, consisting of an engine and tender, five carriages, and a breakdown. It ran to its usual place at the south-east of the platform, and was detained there by the station-master for the arrival of the 12.30 train from Newcastle, with which it had to interchange passengers; but which did not arrive, according to the station-master, until 3.48, 37 minutes late. The 6 a.m. local goods train from Hexham (on the Border Counties line) had reached Riccarton at 3.2, three hours and thirty-two minutes late, after having been detained for want of the train-staff, by the 8.10 a.m. goods train from Edinburgh to Newcastle; but the above 12.30 p.m. passenger train from Edinburgh had (though it arrived after the goods train) proceeded to its place at the platform before the driver of the goods engine could, after shunting his waggons on the west of the main lines, get to the turntable, his only road to which was along the platform line occupied by the Edinburgh train.

The station-master was naturally anxious that the goods train, already so late, should be ready to return to Hexham as soon as the single line was cleared for it by the arrival of the passenger train, then over-due, for which the train from Edinburgh to Carlisle was being detained; and he ordered the guard of this Edinburgh train to set his train back into the standing place of the Border Counties passenger train, so as to allow the goods engine to run down to the turntable. The goods engine, standing on the second line from the platform, was then so near the passenger train that the station-master directed the fireman, who happened to be upon it, to move northward, sufficiently far from the points to let the passenger train run clear of it on the platform line. The fireman moved as directed, the passenger train was set back, and two or three carriages had passed through the points when the goods engine ran back upon the passenger train. A hole was made in the tender of the goods engine, two of the passenger carriages were damaged and thrown off the line, and one passenger was injured. The other passengers were, fortunately, most of them on the platform.

The driver of the goods-engine, who had found that the passenger train was in his way, and would prevent him from getting to the turntable, and who had heard that the Border Counties passenger train was reported by telegraph to be 40 minutes late, had gone away, after oiling his engine, to his home, about 60 yards distant, to eat his dinner. He told the fireman, as he left him, not to move the engine until his return; but in entering his house he heard a whistle from the engine, and on looking round he saw that the above described collision had occurred.

The fireman, Thomas Cole, had previously acted half a dozen times in that capacity, but was doing duty as a regular fireman for the first time. On being directed by the station-master to move his engine forward (northward), to allow the passenger train to set back, he turned on his steam; and he shut it off again, and applied his break, when he was ordered to stop. He then, as he thought, "to make it more safe," reversed the engine, and found to his surprise that it moved back against the passenger carriages. He tried to push his reversing lever over again into forward gear; but it flew back, and forced him backward on the tank of the tender; and he could not then recover himself in time to be of any use. It appears that the steam which remained in the cylinders when the engine was brought to a stand on a rising gradient was sufficient to set the engine in motion down again towards the carriages when it was reversed.

This, the principal cause of the collision, was clearly accidental; but the necessity for setting back the passenger train from Edinburgh from its own standing place to the standing place of the over-due Border

Counties passenger train, in order to allow the goods engine to proceed to the turntable, was incidental to the defective construction of the station. I am happy to learn that this is the first collision that has occurred at the Riccarton Junction since it has been opened for traffic, but I fear that as the traffic increases the want of better arrangements is likely to make itself more clearly manifest.

I am, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

SIR,

Edinburgh, 17th March 1866.

IN compliance with the instructions contained in your minute of the 26th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 18th January last at Bathgate on the Monklands section of the North British Railway.

This station is 19 miles from Edinburgh, and 10 miles from the Ratho Junction with the Edinburgh and Glasgow Railway. Three passenger trains arrive at and depart from it together daily between 8.15 and 8.45 a.m., from Edinburgh, Airdrie, and Morningside; two passenger trains between 1.30 and 2 p.m.; and three passenger trains between 5.15 and 5.45 p.m. But there is only one platform, 80 yards long, for their accommodation. The station is, as it were, on a branch, which joins the main line about 200 yards from the station buildings, there being a pointsman's hut 150 yards from the end of the platform. The mineral traffic past this, the Bathgate Junction, is very heavy, entailing constant shunting past the above hut. And of the above passenger trains, the train from Edinburgh, which runs into the station engine-first is backed out on its departure from Morningside; the train from Morningside is backed into the station, and runs out engine-first for Edinburgh; and the train from Airdrie is backed in on its arrival, and out on its departure. There are no signals between this junction and the station, or at the station; but there is a distant signal from the junction towards Edinburgh; and there are a distant signal and telegraph towards the Polkemmet Junction, half a mile distant, where the lines diverge towards Morningside, Coatbridge, and Slamannan.

On the 18th January there were three passenger trains in the Bathgate station at 5.30 p.m. as usual; and at 5.35 the Airdrie train was pushed out, according to practice, by the engine of the Morningside train. That engine then returned to the station, while the Airdrie engine, coming from the turntable, was attached to its train. But the Morningside engine had not pushed the carriages back through the junction with the main line; and the Airdrie engine was obliged to do so before starting forward with them for the Polkemmet Junction; and some extra delay was thus occasioned. The pointsman went to the junction points, which are about 50 yards beyond his hut, and held them for the Airdrie train to pass towards the Polkemmet Junction. While he was engaged in holding them, and signalling with his hand-lamp to the Airdrie engine-driver that all was right for him to go away, and when the last carriage of the Airdrie train was on the points, the Morningside train, backing after it out of the station, came into collision with it. The pointsman, whose attention was taken up with the Airdrie train, did not see the Morningside train until it was passing his hut, and just before the collision.

It was quite dark when this occurred. The engine driver of the Airdrie train, who had four carriages and a van attached to his engine, did not see the Morningside train before the collision. The driver of the Morningside train, who was pushing five carriages and a van before him, was looking over the side of the engine towards his right, while his fireman was looking over towards the left. He saw no

signal at all himself, but his fireman called to him to stop, and he shut off his steam and reversed his engine before the collision. The guard of the Morningside train stood on the step of his van as the train backed out of the station. He could not see anything of the pointsman, but he saw a light from the break-van of the Airdrie train as he approached it. He jumped off his van, turned the red glass on his hand-lamp, waved it towards his engine, and called out to the driver to stop. It was this guard's lamp that the fireman had seen when he warned the driver just before the collision.

Two wheels of a carriage in the middle of the Airdrie train were thrown off the line. The break-van of the Morningside train had a panel and a lamp-holder broken. One passenger was slightly injured.

The station-master started the Morningside train at 5.40, five minutes after the Airdrie train, under the belief that the latter had been gone long enough to get out of the way, which would probably have been the case if the Morningside engine had pushed it back to the main line in the first instance.

It appears that signals and a locking apparatus were ordered for this Bathgate Junction some time since; and a semaphore post for four arms, as well as the necessary apparatus, were even sent to the spot twelve months ago. It is desirable that the stage and the signal arrangements, with the means of working all the points from the stage, and intercommunication between the Bathgate Junction and the Station, should be completed as soon as possible, as well as that the Bathgate Station should be entirely remodelled, that suitable accommodation may be afforded for the important and increasing traffic which it is required to accommodate.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

W. H. TYLER,
Capt. R.E.

SIR, *Newcastle-on-Tyne, 20th March 1866.*

IN compliance with the instructions contained in your minute of the 26th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 23rd ultimo on that part of the Monklands section of the North British Railway which lies between Avonbridge and Slamannan.

The Avonbridge Station is 24 miles from Edinburgh, $4\frac{1}{2}$ miles from Bathgate, $3\frac{1}{2}$ miles from Slamannan, and 6 miles from the Manuel Junction.

The 4.30 p.m. passenger train from Airdrie and Slamannan reached Avonbridge in due course on the afternoon in question about 5.25; but the engine-driver reported to the station-master that he was unable to take the train forward. The station-master therefore sent a mineral engine, which was standing at the station, with the passenger carriages to Manuel Junction; and he allowed the passenger driver to run back towards Slamannan to search for a pin or bolt which was missing from his engine.

There is a single line only between Avonbridge and Slamannan, which is worked by telegraph with the instruments of Mr. Tyers, and his usual printed code of regulations. And the Avonbridge station-master, after sending the passenger engine back towards Slamannan, gave five beats on the bell for "obstruction," turning the black needle at Slamannan to "train on line." Slamannan repeated the five beats for acknowledgment, and kept his red needle at "line clear." The line was then blocked from Avonbridge, for some cause, of which Slamannan knew nothing; and the block could only be properly removed again by Avonbridge.

About 6.30 p.m. an engine approached Slamannan from Mossley on the west, to go three quarters of a mile towards Avonbridge, to the Strathavon siding;

and the Slamannan station-master, finding the "block" still on his instrument, feared that Avonbridge might have forgotten to remove it. He therefore gave one beat (according to the note of Rule iii. of his Code) to ask if such was the case; and Avonbridge acknowledged with one beat in reply, still, however, leaving the black needle at Slamannan at "train on line." Slamannan then sent one beat a second time, and Avonbridge replied with one beat, removing the black needle this time to "line clear." Slamannan understood by this that the obstruction was removed, and proceeded to give five beats, to start his engine to the Strathavon siding in the usual way. But learning afterwards from the engine driver that he did not require to go to the siding again that night, he removed the obstruction signal; and he received the signal for a passenger train from Avonbridge about 6.38, in the usual form.

I have here followed the evidence of the Slamannan station-master, which differs to some extent from that of the Avonbridge station-master. The latter states positively that he received the five beats from Slamannan, for obstruction, and that the obstruction was again removed before he turned Slamannan's black needle to "line clear;" and that he was thus led to believe that the passenger engine had reached Slamannan. In any case, he acted as if he thought it had done so, inasmuch as he signalled the passenger train away on his instruments, and started it with the mineral engine towards Slamannan, while the passenger engine was still between him and that station. He told the mineral driver, however, how long the passenger engine had been gone, and instructed him to keep a sharp look-out for it in case it should not have reached Slamannan.

The driver of the passenger engine had observed, in the first instance, on his way from Slamannan, when he turned on his steam at a mile and a quarter from Avonbridge, that only one side of his engine was working; and he had seen, in walking round the side, that the pin had dropped out from its right valve spindle. He ran forward, working with one cylinder, to Avonbridge, and told the station-master that he could not go further, but that he would go back to search for the pin while the mineral engine took the train on to the Manuel Junction. The fireman and a greaser were sitting in front of the engine, looking for the pin, as he went slowly back towards Slamannan; but there was snow on the ground, and they were unable to find it. He went about two miles and a half, and he also tried to insert other pins which he had on the engine; but he could not find anything to fit his valve-spindle. He turned at length to run back towards Avonbridge; and in running through a cutting with a curve at each end of it, about a mile from Avonbridge, he saw the sparks of the mineral engine in the distance. He did what he could towards pulling up, and had nearly brought his engine to a stand when the collision occurred. He was traveling tender first, and the buffer beam of his tender was broken by the shock.

The mineral engine was also travelling tender first, with two carriages and a break van behind it. The driver was running at a speed of 12 miles an hour according to his own account, or 15 miles an hour according to the evidence of the guard, when he saw the lights of the passenger engine before him. The guard states that he had not time to apply his break after hearing the engine whistle, before the collision. The buffer beam of the tender was knocked off, and a hole was made in the tank. Four passengers were slightly injured.

This collision appears to have been caused by a misunderstanding on the part of the Avonbridge station-master of the signals made to him from Slamannan, arising, however, from his own mistake, and not from any want of proper working by the Slamannan station-master. It confirms what I have frequently had occasion to point out with reference to these instruments of Mr. Tyers, namely, that in order to avoid misunderstanding in exceptional cases, those

who are expected to work them should also be provided with speaking instruments. If Avonbridge had been able to inquire of Slamannan on a speaking instrument, whether the passenger engine had gone forward to that place, he would hardly have sent the passenger train towards Slamannan without adopting that precaution. But I consider, myself, that the train-staff system is, upon the whole, safer than any

telegraph system; and I recommend, either that this portion of railway be worked by train-staff and ticket, or, if the traffic be too heavy to admit of such mode of working, that it be laid with a double line of rails.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

SOMERSET AND DORSET RAILWAY.

Board of Trade
(*Railway Department*),
Whitehall, 9th February 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Somerset and Dorset Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred on the Somerset and Dorset Railway near Wimborne Junction, on the 11th ultimo.

I have, &c.

W. D. FANE.

The Secretary of the
Somerset and Dorset
Railway Company,
Glastonbury.

Board of Trade
(*Railway Department*),
Whitehall, 7th February 1866.

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 17th ultimo, the result of my inquiry into the circumstances which attended the collision that occurred on the 11th ultimo between a passenger and a goods train proceeding in opposite directions, on the single line of the Somerset and Dorset Railway between Blandford and Wimborne, when three servants of the Railway Company were seriously, and three passengers were slightly injured.

This collision occurred within about three quarters of a mile of Wimborne Station on the Dorchester branch of the London and South-western Railway, and half a mile from the Wimborne Junction. It happened on the afternoon following the night on which there was a very heavy fall of snow, accompanied by a severe storm, the effect of which, on the Somerset and Dorset Railway as on many other lines in the south of England, was to blow down the posts supporting the telegraph wires, and to interrupt entirely all telegraphic communication along parts of the line. According to the company's regulations the traffic on this single line is worked with the assistance of the electric telegraph and on the block system, so that no two trains are permitted to be on the line between two adjacent stations at one and the same time; the particular stations where trains proceeding in opposite directions are directed to pass each other are clearly stated in the company's service time tables, and no change is permitted to be made in the passing places, except by the Company's superintendent stationed at Glastonbury, by means of a telegraphic message.

The effect of the interruption of all telegraphic communication on the Somerset and Dorset Railway was to cause many trains to be greatly delayed, and the absence of any telegraphic communication prevented any change being made in the usual passing places, as prescribed by the service time table, by the superintendent at Glastonbury.

The company's book of regulations, however, fully provides for this exceptional condition of things, as rule X, page 24, states that "should both telegraphs

"be out of order, no train shall be permitted to pass the crossing place fixed by the time bill, until the train it is appointed to meet shall arrive at such crossing place, or unless and until a message in writing, signed by the station agent, shall have been forwarded by special messenger from station A to station B to ascertain that the line is clear, and a written answer has been received by station A from station B that the line is clear and that the train may proceed."

Now it so happened that the 1.0 p.m. up train from Burnham to Poole, which is appointed to leave Blandford for Wimborne at 3.25 p.m., did not reach Blandford until it was time for the short up train from Blandford to Wimborne to leave according to the service time tables at 5.25 p.m. But this short train is not authorized to leave Blandford for Wimborne until after No. 13 down goods train, due at Blandford at 4.25 p.m., had arrived. And it is stated, that the Blandford station master (Mr. Tovey) immediately before the 1.0 p.m. train from Burnham arrived at the station, determined to couple the 5.25 p.m. up train to the 1.0 p.m. up train, and to send them forward as one train; and the pointsman on duty says that he went down to the engine shed with one of the porters for the purpose of bringing the 5.25 p.m. up train out, in order that it might be coupled on to the 1.0 p.m. train; but that on reaching the engine shed they could not find either the driver or fireman; and the pointsman says that he then went back and told this fact to the station master, who was then standing opposite to the break van next the engine, and the station master then told the guard of the 1.0 p.m. train, that he was to tell Mr. Ingelthorp, the London and South-western station master at Wimborne Station, "that he was to keep the down goods train at Wimborne until the arrival of the 5.25 p.m., as he was going to start the 5.25 five minutes after the other (the 1.0) train." Mr. Tovey is said to have repeated this message more than once; and the guard is stated by some of the parties present to have repeated the words and by others to have replied that he perfectly understood that he was to tell Mr. Ingelthorp to keep the goods train until the arrival of the 5.25 p.m. train. There does not appear to be any doubt that words to this effect were made use of by the Blandford station master, Mr. Tovey, when speaking to the guard of the 1.0 p.m. train as one of the witnesses called to support the guard's statement, the guard of a ballast train, admits that he heard them, but denies that the guard made any reply as "he paid no attention and he was busy with his work," and he adds that after a pause of about a minute Mr. Tovey said "Let the trains cross in their right course," and then he says the guard of the 1.0 p.m. train was paying attention. The guard denies having been told to tell Mr. Ingelthorp to keep the down goods train until the 5.25 p.m. had arrived, but says he was told to tell him that the trains were to start in their regular course, and when the 1.0 p.m. train arrived at Wimborne station, Mr. Ingelthorp was only told by the guard that the trains were to go on in due course.

The station master's written statement is supported by the foreman porter, the pointsman, and partially by

the guard of the ballast train; while the guard's version of the affair is partially borne out by the guard of the ballast train and the fireman of the 1.0 p.m. train.

I did not see the Blandford station master, as he had been dismissed by the Directors of the Company, neither did I see the drivers of the 5.25 p.m. passenger or down goods trains, nor the guard of the 5.25 p.m. train as all were so much injured. I was informed that the medical attendant thought they should not be questioned. It also appears that the driver of the 5.25 p.m. train objected to proceed when directed to do so by the Blandford station master, as he said the goods train ought to arrive before they left, but he at last consented to do so when positively ordered by the station master to proceed, who told him that he had sent on a message to Wimborne Station for the goods train to stop there, until the 5.25 p.m. train reached that station.

The station master at Wimborne dispatched the down goods train towards Blandford immediately the 1.0 p.m. up train had arrived and he had received the message from the guard about 6. p.m., and no blame attaches in any way to him for so doing, as he was acting in obedience to the company's regulations, and in accordance with the message he had just received through the guard. The up and down trains thus sent forward on the single line respectively from Blandford and Wimborne came into contact with each other about half a mile from the junction, some 200 yards after the down goods train came out of a cutting. The two trains, if a sharp look out had been kept, could not have been seen at a greater distance from each other than some 500 yards. The 5.25 p.m. up train was slackening speed in order to pull up at the junction, but the goods train is stated by the guard to have been travelling at from 15 to 20 miles an hour when the collision took place. The 5.25 p.m. up train consisted of an engine and two carriages, and the down goods train of an engine, three waggons, and one passenger carriage. Neither of the engines were thrown off the line, but the two last waggons and the passenger carriage in the goods train were thrown off the line. The two engines were a good deal damaged

as the cylinders, buffer beams, and buffers were all broken, the outside and inside frames bent, &c. The tenders also were a good deal damaged, and the passenger train is said to have been forced back somewhere about 80 yards. Fortunately there were only three passengers in this train, as the bulk of the passengers from Blandford to Wimborne had been sent forward by the 1.0 p.m. up train.

With respect to the causes which led to this collision there can be doubt whatever that it resulted from the act of the Blandford station master in not complying with the company's regulations, in directing the 5.25 p.m. up train to follow the 1.0 p.m. up train, before the down goods train No. 13 had reached Blandford. No doubt he was anxious to get the line into fair working order again, and to allow the trains to run nearly to their proper time. He would have acted very properly if he had coupled on the 5.25 p.m. to the 1.0 p.m. train, but not having done so, and still wishing to send the 5.25 p.m. train forward after the 1.0 p.m. train had left, he should at least have sent a written message by the guard of the train, requesting the Wimborne station master to keep the down goods train until the 5h. 25m. had reached Wimborne. Even this would have been irregular and in opposition to the company's regulations, which are clear and explicit, but it is most probable that it would have prevented the collision from taking place. I do not pretend to say whether the Blandford station master, Mr. Tovey, did give the message to the guard of the 1.0 p.m. train to which I have referred, so as to be heard and understood by the guard or not. The weight of evidence is somewhat in favour of his having done so; but at all events, he should have done something more, so that there might be no mistake, viz. to have sent a written message.

I should only add that it is very undesirable to attach passenger carriages to goods trains, which appears to have been done to No. 13 down goods train from Wimborne.

I have, &c.

*The Secretary of the
Board of Trade,
(Railway Department).*

W. YOLLAND,
Colonel.

SOUTH-EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 20th Jan. 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the South-eastern Railway Company, the enclosed copy of the report made by Capt. Rich, R.E., of his inspection of the Spa Road Station of the South-eastern Railway, pursuant to a minute of this Board of the 5th inst., and in which he refers to the fatal accident that occurred to a female passenger at that station on the 7th inst.

My Lords trust that the new station, which Capt. Rich informs them is in course of construction, will be completed in accordance with the Board of Trade requirements as early as possible, and that during the progress of the works the precautions recommended by Capt. Rich for ensuring the safety of the public will be observed.

I have, &c.,

*The Secretary of the
South-eastern
Railway Company.*

W. D. FANE.

*Board of Trade,
(Railway Department),
Whitehall, 16th Jan. 1866.*

SIR,

WITH reference to the complaint which has been addressed to the Lords of the Committee of Privy

Council for Trade, relative to the dangerous state of the Spa Road Station on the Greenwich line, I have the honour to report that, in compliance with your minute of the 5th instant, I inspected the station referred to on the 10th inst.

It consists of a platform 105 yards long, which is 8 ft. 8 in. broad at the widest part, and narrows gradually to 7 ft. 9 in. at each end.

In the centre of the platform there is a well hole, 18 ft. long by 4 ft. 8 in. broad.

The only access for passengers to, and from the platform, is by stairs in this opening, which reduces the platform, to 2 ft. wide at each side of the stairs.

Cast-iron columns, to carry the roof, are placed at intervals along the centre of the platform.

There are no station buildings; but there is a signalman's box at the end of the platform.

One line of rails (the one now used as the up line from Greenwich to London) is situated on the north of this platform. The rails now used as the down line to Greenwich, and for the North Kent down traffic, are situated at the south side of the platforms adjacent to it. There are four other lines of rails on the south side of the Spa Road platform.

The two centre ones are the original Greenwich lines. They are now used (the one next to the down Greenwich line) as the North Kent up line, and the other as the line for the main down traffic of the South-eastern Railway, and for the traffic of the London, Brighton, and South Coast Railway.

The line for the South-eastern main up traffic and for the traffic of the London, Brighton, and South Coast Railway, is next to the last on the south side, and the most southern of the whole six lines, is used for the traffic up to London from Croydon, and for the Crystal Palace traffic.

The Spa Road Station, in its present state, is most inconvenient and dangerous, and does not appear, to admit of any beneficial alteration.

I was informed that no accident had happened there till the night of the 7th inst., when a woman, who is supposed to have alighted from the Greenwich train, is said to have jumped from the east end of the platform, just before the 9.30 p.m. North Kent down train ran through the station. She was struck by the engine and killed on the spot, whilst one of the station porters was endeavouring to drag her off the line.

I think it probable that the woman missed seeing the steps leading from the platform, and was making

her way towards the signal hut, at the end of the platform, thinking it was the way out, and accidentally stepped off the platform and fell on to the rails.

The South-eastern Railway Company have made considerable progress, with the building for a new station at Spa Road, and propose having a platform 15 ft. wide for the up and the down Greenwich lines.

I would suggest that the South-eastern Company be urged to complete the new station at Spa Road as soon as possible, and in doing so, to take care to comply with the regulations of the Board of Trade, with which the present platform is so much at variance, and in the meantime that the station master and porters at Spa Road receive special instructions to look carefully after passengers getting out of the trains.

I have, &c.,

*The Secretary of the
Board of Trade
(Railway Department).*

F. H. RICH,
Capt. R. E.

SOUTH-EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 17th February, 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the South Eastern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the fatal accident which occurred to R. Kennett, on the 11th ultimo, at the Belvedere Road signal box, near the Charing Cross Station.

My Lords trust that the Directors will adopt Captain Rich's recommendation with respect to an alteration in the relative position of the rails of the siding he refers to, and the posts and struts of the signal box.

I am, &c.

W. D. FANE.

*The Secretary of the
South-Eastern
Railway Company.*

SIR,

Dulwich, 14th February, 1866.

IN compliance with the instructions contained in your minute of the 27th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident, that occurred on the 11th January 1866, at the Belvedere Road signal box, near Charing Cross Station of the South-Eastern railway, when Richard Kennett (fireman) received such injuries, that he died on the 21st. ultimo.

On the arrival of a train from Beckenham, at 9.30 p.m. on the 11th ultimo, the driver, George Crewe, was ordered to be in readiness, to return with a train to Strood, at 10.50 p.m. if the driver of the up train from Strood, which was due at 9.50 p.m., did not arrive in time.

George Crewe accordingly, took his engine across to the Belvedere signal box. The siding where the ash-pits are, and off which the road to the turntable is taken, runs directly under the Belvedere signal box.

After turning the engine, Crewe ran her under the signal box, to the ash-pit just beyond, to remain there till he was wanted.

The Strood up train, which, in consequence of the snow, was expected to arrive too late for the same

driver to return with the 10.50 p.m. down train to Strood, arrived in sufficient time, and the driver, Frederic Wilton, brought his engine to Belvedere to turn and get it ready to return with the 10.50 p.m. train.

This driver, after placing his engine on the turntable, got off, to speak to Crewe, who was in the act of starting with his engine, to return to Charing Cross station. He heard him ask his unfortunate fireman, (who had been under the engine for the purpose of oiling it,) if he was "all right," to which the latter replied in the affirmative. A moment afterwards, he heard the fireman moaning on the ground.

The latter must have been in the act of getting on to his engine, as it passed under the signal box; he was knocked down, and the engine wheel passed over his feet. He died on the 21st ultimo from the injuries he received.

The signal box is elevated on four timber posts, which are 12 inches square. There is one post at each angle, and angle struts from the posts to the horizontal cross ties. The rails of the siding leading to the ash-pits, which pass between these posts, are not at equal distances from them. The distance of the rail from the pair of posts at one side is barely three feet, and the vertical rods working the points are three inches nearer to this rail.

The distance of the rail from the pair of posts at the other side, is 5 feet 6 inches.

Judging from the evidence given to me, as well as from the position of the posts, rods, and struts, I am of opinion that the fireman struck his shoulder against one of the posts of the Belvedere signal box, or against the rods by which the points are worked, and was knocked off the steps, as he was getting on to his engine.

I recommend, that the siding under the Belvedere signal box, which leads to the ashpits and is used as a place for engines to wait, be moved to a position exactly central between the posts supporting the signal box. The struts cannot then interfere, unless with a very tall man, standing on one of the springs or on the fender plate where it is raised over the wheels, but I would suggest their being also raised.

I have, &c.

*The Secretary
Board of Trade,
Whitehall.*

BRISTOL AND EXETER RAILWAY.

Board of Trade
(*Railway Department*),

Sir, 26th April 1866.

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Bristol and Exeter Railway Company, [London and South-Western Railway Company], [Exeter and Crediton Railway Company], the enclosed copy of the report made by Colonel Yolland, the officer appointed by their Lordships to inquire into the circumstances connected with the accident which occurred on the 17th February last to a London and South-Western Railway Company's narrow-gauge passenger train, from getting off the rails at the junction of the Bristol and Exeter and Exeter and Crediton Railways at Cowley Bridge.

My Lords will be glad to receive, as early as possible, any observations which the Directors may have to offer thereon.

I am, &c.

The Directors of the
Bristol and Exeter
Railway Company;
London and South-Western
Railway Company;
Exeter and Crediton
Railway Company.

Board of Trade
(*Railway Department*),
Whitehall, 13th April 1866.

Sir,

I have the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of 24th February, the result of my inquiry into the circumstances which attended the accident that occurred on the 17th February on the Bristol and Exeter Railway, when a London and South-western Railway Company's narrow-gauge passenger train partly got off the rails at the Cowley Bridge Junction about 7 p.m. Fortunately no persons were injured, but the rolling stock sustained some damage.

It appears that as the 4.50 p.m. up train from Bideford to Exeter, which consisted of an engine and tender, one third-class, one first-class, two second-class carriages, and one break van, was passing from the up to the down line, by the cross-over road which connects the single line of the Exeter and Crediton Railway with the down line of the Bristol and Exeter Railway, the engine and one of the carriages suddenly left the rails, and, passing along the six feet space, stopped in about 55 yards, under the bridge that carries the turnpike road over the railway at Cowley Bridge.

The train had previously been brought almost to a stand-still on the opposite side of the river Exe, on the Exeter and Crediton Railway, in accordance with the usual practice; so that it was not travelling fast when the engine left the rails; and as the ground was soft, in consequence of recent repairs to the line, rendered necessary by some damage which had been done by floods that had occurred a short time before, the engine sank deep into the ballast; and that will account for its running so short a distance after it got off the rails.

On examination afterwards a guard or check rail 16 feet in length, placed inside the left rail of the cross-over road, and forming a portion of the total length of guard rail of 41 feet, was found to have been entirely forced off, and lay on its side; and the fixed point of the crossing had been struck by the flange of the right wheel, as it passed on the wrong side of the point on the outside of the curve,

which it was enabled to do as soon as the guard rail gave way, and yielded to the side pressure of the wheel of the engine as it passed along the sharp curve. This guard rail had been fixed to eight iron plates, secured to the longitudinal timbers that carry the rails by fang bolts, by means of 14 bolts riveted below the under-sides of the plates.

The iron plates remained undisturbed, embedded in the longitudinal timbers, but the hammered heads of the whole of the rivets had been stripped off. Nine were subsequently collected, and of these only three appeared to have been recently stripped off. No traces could be discovered of any wheel being off the rails before the crossing was reached, and no mark could be seen on the guard rail of its having received any blow. It appears, in fact, to have been gradually forced off by the lateral pressure of the wheels, and not to have all been done by the passage of this train. It had only been put in its place in the middle of the previous November, and either the quality of the iron could not have been good, or the workmanship must have been in fault.

I do not consider that any blame is attributable to the platelayers, as they could not see that the heads of the rivets had any of them been stripped off. But I think it is a question deserving of consideration whether these rivets should not in future be on the upper side of the iron plates, instead of being below them, and thus entirely covered up.

There is a sensible difference in the thickness of the flanges of the engines belonging to the two Railway Companies, the Bristol and Exeter having the broadest flanges, and that Company also adopt a wider space between the side of the rail and the side of the guard rail than the London and South-western Railway Company; one Company using a space of $1\frac{3}{4}$ inches, and the other a space of $1\frac{1}{2}$ inches.

The engine which drew the passenger train was a six wheeled four wheels coupled engine, with the leading wheels of 4 feet in diameter, and the coupled wheels of 6 feet 6 inches in diameter, 17-inch cylinders, and 22 inches length of stroke;—the distance between the centres of the leading and driving wheels being 6 feet $2\frac{1}{2}$ inches, and 8 feet between the driving and trailing wheels.

The distribution of the weight of the engine is as follows:—

			tons.	cwts.
On the leading wheels	-	-	11	0
„ driving „	-	-	12	0
„ trailing „	-	-	10	10
Total	-	-	33	10

This engine had been working 14 months on the line previous to this accident occurring.

The gauge of the line was stated to be 4 feet $8\frac{1}{2}$ inches, and that it had about 2 inches of cant. The curve at the part where the engine got off has a radius of about $12\frac{1}{2}$ chains; and there is no doubt that, owing to the sharpness of the curve, the narrow-gauge engine could not be kept on the rails, except by means of the guard rail; and when that failed and gave way, the engine got off, and was followed by one of the carriages.

The engine had both life guards and the cylinder cocks broken, and the right leading spring was also broken, the fractures being recent and evidently caused by the engine getting off the line. The flap of the foot-plate was bent, and the front buffers of the tender were broken.

I had occasion, in reporting upon a similar accident which occurred at the same junction on the 24th August 1859, when a Bristol and Exeter broad gauge engine mounted the guard rail, and subsequently, with

some of the carriages, got off the line, and caused serious injury to several persons, to point out that the Exeter and Crediton Railway had not been permitted to remain in the state in which it was, when inspected and authorized by the Commissioners of Railways to be opened for public traffic, inasmuch as the line had been altered by the substitution of a single for a double junction, and the introduction of a curve of about 14 chains radius, instead of one of 26 or 30 chains, which was made use of in constructing the double junction. I remarked, at the same time, that these alterations materially increased the danger to the public travelling on the Bristol and Exeter and Exeter and Crediton Railways; and suggested, that, if any means existed, the Exeter and Crediton Railway Company should be compelled to restore their line to the state in which it was when inspected and authorized to be opened for public traffic.

Their Lordships did not then deem it expedient to take legal measures to compel the Exeter and Crediton Railway Company to restore their line to the condition in which it was when first opened for traffic; and the Exeter and Crediton Railway Company represented that certain alterations, which were to be made, would remove any cause of danger at that part of their Railway. This representation has not, however, been fulfilled, as another accident has now occurred at the same spot,—fortunately unattended with injury to any person,—due, in the first instance, to the giving way of a guard-rail, and not actually occurring on the Exeter and Crediton Railway, but on the cross-over road for connecting the Exeter and Crediton line with the down line of the Bristol and Exeter Railway; but

which accident could not have occurred at all, except for the alteration from the double to the single line, as no such curve of 12½ chains radius, and curving to the left, would have been in existence, except for that alteration.

I have, therefore, again to suggest, notwithstanding the absence of any precedent for doing so, that in the event of the Exeter and Crediton Railway Company declining to restore the line to the condition in which it was when first opened for traffic, means should be adopted for abating the danger to which the public are continually exposed in passing over this junction, and for which no parliamentary sanction exists.

I understand that the Bristol and Exeter Railway Company, who are part owners of the Exeter and Crediton Railway to the extent of two fifths of the capital, are willing to concur in this alteration being made, but that the decision finally rests with the London and South-western Railway Company; and, looking at the extension of their system westwards beyond Exeter, I trust that they will now see the necessity of removing this cause of danger.

It is a question, moreover, for their Lordships consideration, whether, while such an unnecessary cause of danger is permitted to exist, their sanction should continue to be given to any of the cheap train arrangements for trains passing over the Exeter and Crediton Railway.

I am, &c.

W. YOLLAND,
Colonel.

LANCASHIRE AND YORKSHIRE RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 9th April 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Lancashire and Yorkshire Railway Company, the enclosed copy of the report made by Col. Yolland, of his inquiry into the causes connected with the collision which occurred between two engines near Middleton Junction on the 19th ultimo.

*The Secretary of the
Lancashire and Yorkshire
Railway Company.*

I am, &c.,
J. E. TENNENT.

*Board of Trade
(Railway Department),
Whitehall, 31st March 1866.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 24th instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 19th instant between two empty engines near Middleton Junction, on the Lancashire and Yorkshire Railway, when the driver, W. Bate, of the leading engine was killed, and the firemen of both engines were badly, and the driver of the following engine was slightly, injured.

The Oldham Branch of the Lancashire and Yorkshire Railway joins the main line at Middleton Junction, and there is a loop siding lying east of the junction and south of the up main line from Rochdale to Manchester, which is connected with the up main line by a pair of facing points at the junction, and also by a pair of leading points, called the top points, situated about 480 yards nearer to Manchester than the junction.

The down distant-signal is about 460 yards west of the top points, and there is another intermediate down distant-signal worked from the junction, which is about 80 yards west of the top points.

Some waggons, intended for Oldham, were standing in this siding on the early morning of the 19th instant, and the waggon nearest to the junction being a damaged waggon, the porter acting as pointsman at the junction went westwards to the top points to hold them open whilst an engine went into the siding to bring them out on to the up main line, in order that they might be shunted by a cross-over road on to the down main line; but before the engine brought the waggons out from the siding, the pointsman turned on the up and down distant signals to "danger," by which the cross-over road is protected.

The waggons were then pushed across to the down main line, the pointsman holding the points of the cross-over road, and then the engine was detached from the waggons, and returned by the cross-over-road to the up main line, for the purpose of proceeding towards the junction, along the up or wrong road, to another cross-over road lying nearer the junction, that the engine might be attached to the other end of the waggons and take them to Oldham.

Whilst the engine was shunting the waggons across from the up to the down line, the pointsman observed an engine advancing towards the junction on the down line from Manchester, and when the first engine returned from the down line and proceeded towards the junction, the pointsman turned off the down distant signal worked from the top points, and at the same time waved his hand lamp for the engine advancing towards the junction to come on. The pointsman thought this engine was just moving, and he ran towards the junction to be ready to hold the points for the engine with the waggons to pass on to the Oldham Branch.

The engine advancing towards the junction from the direction of Manchester was a tank engine on its way to Middleton Station for an early train to Middleton Junction, and the fireman states, that as they approached Middleton Junction they found both distant signals on at "danger" against them, and his driver shut off the steam and sounded the whistle, and then they saw a goods train thrown across the

down line from the up road; at which time they had just passed the first distant signal, and he then turned round and put on his break so as to diminish the speed, and saw another engine following them on the down line. He says they had not stopped at that time, but he told the driver to go on a little quicker, as there was another engine coming. He observed the driver with his hand on the regulator, and he states that they were still moving ahead when the other engine overtook and ran into them, somewhere about 5 a.m. He says that his engine carried a white light in front, and a red light behind; that he lit both lamps himself, and that they were both burning well when they left Miles Platting. His testimony is confirmed by the pointsman as to the white light in front, but it is contradicted by the driver and fireman of the following engine, who assert that there was no light at the tail of the leading engine.

The driver of the following engine, which was on its way to Oldham to bring an early train from that place, signed the books at the Locomotive Shops at Miles Platting at 4.45 a.m., at which time his engine was ready to start. He was late that morning, as he had overslept himself, the proper hour for leaving being 4.30 a.m., and he states that the first distant signal stood at "all right" when he first came in sight of it, and that he never saw the other engine at all until he ran into it, at a speed which he and the fireman estimated at 8 or 9 miles an hour. He also states that the collision took place two or three minutes after five o'clock, and as Miles Platting is about $3\frac{1}{2}$ miles from the spot at which the collision occurred, it is quite certain that he must have been travelling much faster than the rate he named. The driver of the leading engine had received a heavy

blow on the forehead and had his back broken, and he died before he could be taken to Manchester. He had been a driver for 18 years, and is described as being a steady, careful driver. The buffer beams of both engines were broken, and the buffers knocked off by the collision, which took place 180 yards inside the first and 200 yards outside the second or junction distant signal.

The collision was probably caused by the pointsman having taken off the first down distant signal before he ran back towards the junction, while the Middleton engine was still outside the junction distant signal, and which was thus left without any protecting signal behind it, except the light of the lamp behind, if it was still burning. Another man should have been available at the Middleton Junction for the performance of the signalman's duties. It cannot be considered as a part of the duties of a signalman at an important junction to be running upwards of a quarter of a mile from his post, holding points, and working other distant signals in order to cover shunting operations.

Again, an inspector should be present at the locomotive establishment at Miles Platting to see that all engines that leave are provided with the usual lights in front and rear, and that they are burning properly when they leave the station yard.

I am unable to say whether there was any light burning at the tail of the Middleton engine, as both lamps were smashed in the collision.

I have, &c.

W. YOLLAND,

Colonel.

*The Secretary of the
Railway Department,
Board of Trade.*

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 17th April 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade, to transmit to you, to be laid before the Directors of the London, Brighton, and South Coast Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred at the New Cross station of the London, Brighton and South Coast Railway, on the 31st ultimo.

*The Secretary of the
London, Brighton, and
South Coast
Railway Company.*

I am, &c.
W. D. FANE.

*Board of Trade,
11th April 1866.*

SIR,

IN compliance with the instructions contained in your minute of the 5th April 1866, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 30th March 1866, at New Cross station of the London, Brighton, and South Coast Railway.

Numerous special trains were run on that day (which was Good Friday) between the Crystal Palace and London.

One of these special trains travelling from the Crystal Palace to London Bridge was drawn up at the platform of New Cross station about 11.22 p.m. Whilst it was standing there another special train, which left the Palace a few minutes before 11, and which had stopped at Sydenham and Forest Hill, stations, to set down passengers, ran into New Cross station and came into collision with it.

The train that was standing at the platform, consisted of an engine and tender, two guard's break vans (one of which was at the tail of the train) and eleven carriages.

The light at the tail of this train had gone out, between Forest Hill and New Cross stations, and the guard was in the act of renewing it when his train was run into.

The train that ran into the one standing at the station, consisted of an engine and tender and 11 carriages. Two of these carriages had break compartments with guards in them, one guard being in the carriage next to the tender and the other in the carriage at the tail of the train. As this train approached New Cross station, the auxiliary as well as the station, signal were at danger. Under these circumstances it was the duty of the driver, to pull up outside the station, and not to enter the station, till he had received a signal to do so.

The driver of this second train, admits that he observed that both the auxiliary and station signals were at danger, and he states, that he pulled up, or very nearly so, outside the station, but that when he got within 100 yards of the platform, he looked forward, and believing that there was no train standing at the platform, he allowed his train to run slowly in.

The approach to New Cross station from the south is on a falling gradient of 1 in 100, which changes to a level gradient at the over bridge at the south end of the platform.

Owing to the lamp at the tail of the train which was standing at the platform having gone out, the driver of the second train did not perceive his mistake, till they got within 18 or 20 yards of the standing train.

The first thing that he noticed, was the reflection of a white light on the back of the van. He reversed his engine, put on steam, and desired his fireman to apply his break, but he could not prevent his engine,

from striking the hind van of the standing train, at a speed, which he estimates at about two miles an hour, but which judging by the effects, was probably three or four miles per hour.

The London, Brighton, and South Coast Railway in providing for such contingencies as lamps being extinguished, always have two ready at New Cross station to replace any that may not burn properly.

There were two such lamps at New Cross on the 30th ultimo, and one of them was handed to the guard of the train by one of the men on duty at the station.

The guard did not consider that the fresh lamp was very bright. He put it on the tail of his train and then opened it, and stood in front of it to prick up the wick. While he was doing so, a man shouted to him "to run, that the train would be into him." He did so, just in time to escape.

None of the carriages in either train, were knocked off the line, nor were either the engines or tenders.

Some of the glass windows of the carriages were broken. The bodies of three carriages were shifted on the frames, and the head stocks and pillars of the break vans were broken.

The standing train was knocked forward three or four carriage lengths.

About 50 passengers are known to have received cuts and bruises, but 100 have sent in claims for injuries. No bones were broken.

James Prevett, the driver of the second train, has been 26 years in the Company's service. He has been a driver for about 17 years, and for the last 14 he has been driving between London and Epsom, so that he knows the line thoroughly.

His only excuse for coming into New Cross station against the signals, and in direct disobedience of the Company's rules, is, that he has often done so before, when he saw that the platform was not occupied with another train.

As New Cross is the station for collecting the passengers' tickets, trains are constantly stopped outside the station, particularly on such holiday occasions as Good Friday. The rule of the Company is, that, after being stopped they shall enter by hand signal from the signalman, whose box is above the over bridge at the south end of the platform. Trains are so frequent, that it is not considered desirable that the signalman should lower his signal to admit them, unless when the line is clear at the time of their arrival.

It appears that a little laxity has crept in at New

Cross, owing to the great number of trains and the anxiety of all the servants of the Company to expedite them as much as possible.

The practice has been, consequently, that sometimes the signalman gives the hand signal to admit the trains, sometimes the station master, and sometimes the head porter, and it naturally follows, that frequently the drivers and guards depend on their own observation, and come in without a signal from any one.

James Prevett states that he has frequently done so before at New Cross station, and his practice appears to have been followed by others, but to have been confined to New Cross station.

Neither the signalman or station master have reported these disobediences of the Company's regulations, which they should have done if they had been aware of them, but they do not appear to have come directly under their notice, for the simple reason, that when trains come in, the station master could not see what the signal man was doing, nor the signal man what the station master was doing, and they therefore supposed, that one or other had given the hand signal calling in the train.

The present accident has been caused by a driver of great experience and bearing a most excellent character having gone on in direct disobedience of the signals, believing that he was able to judge for himself, instead of being guided by the signals and regulations of the Company he was serving.

I recommend that the London, Brighton, and South Coast Railway Company should provide the south signalman at New Cross station with some indicator or small signal for admitting trains to New Cross station after they have been stopped by the auxiliary or station signals, and that such small signal shall be visible to the station master or other person in authority on the platform.

If they think it necessary and desirable, the station master or platform superintendent may be furnished with the means of communicating with the signalman, but I think it essential that the responsibility of admitting trains to the station shall be placed under the control of one person only, and the most proper person appears to me to be the signalman.

I have, &c.

F. H. RICH,
Capt. R.E.

*The Secretary of the
Board of Trade,
Whitehall.*

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 29th May 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London, Brighton, and South Coast Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by their Lordships to inquire into the circumstances connected with the collision that occurred at the Caterham Junction Station on the London, Brighton, and South Coast Railway on the 30th ultimo.

I am, &c.

*The Secretary of the
London, Brighton, and
South Coast Railway Company.*

W. D. FANE.

*Board of Trade
(Railway Department),
Whitehall, 26th May 1866.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for

Trade, in obedience to your letter of the 2nd instant, the result of my inquiry into the circumstances which attended the collision that occurred on the 30th ultimo between a passenger and a ballast train at the Caterham Junction station of the London, Brighton, and South Coast Railway, when two passengers (Mr. and Mrs. Drew) and the head guard (W. Webb) of the passenger train were killed, and the fireman Charles Henry Beckwith was so much injured that he has subsequently died of the injuries he received, and about 36 passengers and the under guard of the passenger train were injured, some of the number very seriously.

Caterham Junction station is about 13½ miles south of London Bridge Station, on the main line of the London, Brighton, and South Coast Railway, where a branch line belonging to the South-eastern Railway Company leaves for Caterham.

The London, Brighton, and South Coast, and the South-eastern Railway Companies are owners of the line between New Cross and Red Hill stations. The northern portion of it, to a little south of Stot's Nest, 14½ miles from London Bridge, belongs to the London, Brighton, and South Coast Railway Company,

To accompany Colonel Yolland's Report dated 26th May 1866, on the Collision near the Caterham Junction Station of the London, Brighton & South Coast Railway.

Links 100 50 0 1 2 3 4 5

SCALE

20 Chains

and the southern portion from near Stoa's Nest to Redhill belong to the South-eastern Railway Company, but the trains of the two companies run over the whole of this line as a road in common to both.

Caterham Junction station is situated rather more than a mile north of Stoa's Nest, and three miles south of Croydon, so that the collision occurred on a portion of the line entirely under the control and management of the London, Brighton, and South Coast Railway Company. The station is protected by station signals, and distant signals north and south of the station on the main line, as well as by the proper signals on the Caterham branch line; and the traffic on the main line is worked with the assistance of the electric telegraph, on the block system, under which no two trains are to be allowed on the same line between two telegraph stations at one and the same time.

There is, however, a ballast siding, which runs out of what is known as the long siding, lying north of the station, and east of the down main line, but close to it, from which a contractor has been engaged for some time past in taking away chalk for ballasting the company's South London lines, now fast approaching towards completion. The long siding is connected with the up main line by a through road, passing across the down main line, and by a pair of falling points placed about 495 yards north of the station signals, and signalman's box. The south end of the long siding is connected with the down main line by a pair of falling points placed opposite to the north end of the down platform.

On the evening of the 30th ulto. a train of 18 empty ballast waggons with two guards vans reached Caterham Junction station from London somewhere about 8.30 p.m., and it was at once shunted into the long siding, through the falling points just referred to, opposite the down platform. The engine was then uncoupled, ran ahead out on to the down main line at the station platform, and the head guard went to the signalman, and obtained the key of the pair of facing points which led by the through road from the long siding to the up main line, to enable the engine to get across to the ballast siding, and the loaded waggons to be taken from it, &c. Particular instructions had been issued with respect to these points which I shall specially refer to; but as soon as the key had been procured, the engine crossed over to the up main line, ran north to the falling points of the through road, and then crossed over the down main line into the long siding, having obtained the permission of the signalman previous to doing so. The engine then took out 18 loaded waggons from the ballast siding, and left the 18 empty waggons, which had been brought from London, in the ballast siding, to be loaded up with chalk; and the ballast train was then placed in the long siding, and made ready to leave for London. These operations occupied about 25 minutes, and the train is said to have been ready to proceed by a little after 9 o'clock.

The written instructions placed in the signalman's box dated the 28th June 1864 are as follows:

"NOTICE to the Signalman at Caterham Junction.

"The chalk siding north of Caterham Junction Station has been connected with the up main line by means of a through crossing over the down main line.

"The crossing being beyond the protection of the semaphore signals, the points have been locked, and the key placed in charge of the signalman at Caterham Junction, who must never on any account permit the crossing to be used without having first given the 'Stop all' or block signal by telegraph to Selsdon signalling station, and had it acknowledged in the usual way.

"The signalman on duty will be held responsible to see that the key is duly brought back to him after each time it is used.

"(Signed) M. G. DENVIL,
"for Traffic Manager."

I am informed that it was intended when this order was issued that every time that an engine or train went into or came out of these sidings from or on to the up main line, the key was at once to be brought back to the signalman; but I find that in practice, when fetched at the same time as on this occasion, it has not been brought back to the signalman after each entry or each departure, but has been retained till the night's work has been done, which sometimes is as late as 7 o'clock the next morning.

It also appeared that this particular up trip of the ballast train had always been made after the 6h. 50m. p.m. South-eastern up passenger train from Dover, due to pass Caterham Junction station at 9h. 36m. had gone by, and also generally after the 8h. 50m. p.m. South-eastern down goods train had passed, which is due there at 9h. 32m. p.m. The South-eastern 6h. 50m. p.m. up passenger train usually follows the Brighton 8h. p.m. up passenger train, which is appointed to pass Caterham Junction station at 9h. 20m. p.m.; but on this night it so happened that the 8h. p.m. train was not running to its proper time, and the South-eastern up train preceded it, and passed Caterham Junction station at 9h. 39m. p.m. only three minutes late.

I must not omit to mention that as soon as the ballast train had been got ready for starting about 9 o'clock, the engine-driver, fireman, and two guards belonging to it, left the station, and went to a beershop not far from the station to get some refreshments; and they say they returned to the station somewhere about 9h. 20m., the time when the 8h. up Brighton train is due to pass. Apparently while they were away, the ganger of the platelayers and the contractor went to the signalman, one after the other, and asked him when the ballast train would be enabled to get away, and was told by the signalman, "When these two trains have passed, or about 9h. 35m. p.m." The signalman explains that by these two trains he meant the 6h. 50m. p.m. South-eastern, and the 8h. p.m. Brighton trains.

The men belonging to the ballast train went down the steps at the side of the signalman's box on their way to the beershop, but returned by another route across the fields, and they got on to the up platform near its north end, having being absent, they state, about 20 minutes. The engine driver says, that they all then went to the ballast train, the fireman got on the engine, and he (the driver) walked back to the signalman's box, opened the door, and spoke to the signalman as follows: "The Dover (South-eastern) train is late to-night." The signalman answered "that it was;" and then he added, "As soon as it is gone, you will have a clear road to yourselves." The driver says that it was about 9h. 36m. when he spoke to the signalman; at which time, however, it must be remarked, the South-eastern train was not late. He then walked along the up platform towards his own train, and the South-eastern up train passed him just as he got back to his engine. On another occasion he stated that this train passed him at the further end of the platform, that he then walked on, and had just got on to his engine when the South-eastern down goods train went by, and when it was clear of the station he whistled, and he saw the signalman or a man come out of the signal-box, and wave his hand-lamp, showing a white light, two or three times; and the head guard of the ballast train answered the signalman, by waving his hand-lamp in return; that the head guard was leaning out of the van at the time, and he called out "All right, mate;" and the driver then moved his train ahead out on to the up main line, the ganger of the platelayers holding the points for the train to pass out. The two guards of the ballast train say that the driver left them on the platform, walking southwards to the signalman's box, while they went northwards to the ballast train, after they had got back from the beershop through the fields. But the fireman supports the driver's statement that he did not go back to the signalman until they had reached the ballast train. At all events, the engine driver's state-

ment, if it is to be depended on, would go far to show that, instead of being away 15 or 18 minutes, as he states, at the beershop, it must have been much nearer to half an hour.

But the whole statement is distinctly denied by the signalman, who says that the engine driver never came back to his box at all, nor asked him any question about the Dover train, and that he never told the engine driver anything about having a clear road, and in fact he never spoke to him. The signalman is equally clear that he heard no whistle from the ballast engine, and gave no hand signal to the driver of the ballast train to proceed.

He states that the South-eastern up passenger train due to pass his box at 9h. 36m. was telegraphed forward from Stoa's Nest at 9h. 37m., passed his box at 9h. 39m., was given on to the Selsdon telegraph station, north of Caterham Junction station, at 9h. 39m., and that directly this train passed he telegraphed its arrival back to Stoa's Nest; it was telegraphed back from Selsdon as having passed at 9h. 41m.; and he then pulled off his self-acting up distant signal, and lowered the up semaphore signal to "Caution;" that at 9h. 45m. Stoa's Nest gave three rings on the telegraph bell, which is the signal for an up Brighton train; and he then lowered his up semaphore signal to "All right," and the 8h. p.m. up train passed his box at 9h. 47m.; that he then heard the wire of the down distant signal break, but did not know there had been any accident. He adds that he had a South-eastern down goods train telegraphed forward to him from Selsdon at 9h. 37m. at the same time that the South-eastern up passenger train was telegraphed from Stoa's Nest; and the down goods train passed at 9h. 45m. at the time when the Brighton 8h. p.m. up passenger train was telegraphed forward from Stoa's Nest, and a Brighton down goods train was telegraphed forward from Selsdon at 8h. 47m.; just after the 8h. p.m. up passenger train had passed his box. There is no direct testimony corroborative of many parts of this man's statement; but the telegraph books kept by himself at Caterham Junction station, and those at Stoa's Nest and Selsdon, support it; and the evidence of the company's servants with the Brighton 8h. p.m. up passenger train confirm it in the most important points as regards the Caterham Junction up station and up distant signals being all right for that train to pass.

The 8h. p.m. Brighton up passenger train, consisting of engine and tender and 18 vehicles, including 4 guards break vans with 4 guards, had "All right" signals shown to it at Stoa's Nest Station; and the driver states that the signals at Caterham Junction were "All right" signals; that they travelled at the rate of 30 miles an hour, after leaving Redhill and seeing the signals all right he passed through Caterham Junction station at the usual speed, and just after he had passed the station signal he noticed a train in the siding on the right hand side of the line; he could see it by the red light at the tail of the train, and it appeared to be in the siding, and not on the up main line. He says that while his train was proceeding onwards, he saw at about 40 yards distance in his front a part of the ballast train on his own line, and he had only time to see that it was across his line, and then the collision took place. The engine he was driving was thrown off the rails, and went some distance down the embankment at that part about 30 feet in height on the left-hand side, breaking away from the carriages; and all he could do before the collision took place was to shut off the steam, which he did the moment before, and he and the fireman both went down the embankment with the engine. He was somewhat shaken, and the first thing he did was to get out his mate, whom he found underneath the tender, very much injured. He then got the fire out of the engine as quickly as he could, and went up on to the line, and found many of the carriages of his train thrown over, and the leading break van smashed to pieces; and the head guard who had charge of it, William Webb, was

lying partly beneath it on the line, and partly under a carriage. He saw him taken out, and he was then dead. The driver appears to have behaved very well. The lady and gentleman who were killed were in a first-class carriage, the second vehicle from the tender, which was destroyed, and it is understood that most of the persons who were injured were in the front part of the train. Another first-class and one second-class carriage, and another guard's break-van, were also greatly damaged, and several of the trucks in the ballast train were broken up entirely while others were more or less damaged and the engine and tender of the passenger train were also a good deal knocked about. The collision must have been a tremendous one, and have taken place, in all probability, at much greater speed than that named by the engine driver. About 15 waggons of the ballast train had got across to the crossing of the up line when the collision took place. I do not think any blame is attributable to any of the company's servants belonging to the up passenger train.

With respect to the causes which led to this lamentable collision, it would appear to be due, according to the evidence of the servants of the company with the ballast train, to the signalman having improperly given a signal for that train to come out of the ballast siding, at the time when he had altered the up distant and up station signals to "All right" for the 8h. p.m. up Brighton passenger train to pass the station; or to their having mistaken some other light for the signalman's hand lamp; or, in opposition to their evidence as to their usual practice, of their having started without any signal at all after the South-eastern up passenger and down goods train had passed.

I do not think the blame rests with the signalman, although his acts are only vouched for by himself; and I consider it to be much more likely that the ballast train started without any signal at all, than that it received a signal from the signalman, as there are various contradictions involved in their separate statements, and it is quite certain that the ballast train was most improperly left by both the driver and fireman at the same time; and they admit that they did not know whether the 8h. p.m. train had passed or not. Still it is possible that they fancied they had received a signal to start, as one of the porters who had been engaged in taking out the light from the branch semaphore signal, and afterwards in putting out the lights on the down platform, brought this light across to the up platform, and afterwards carried it along the platform to the lamp-room about this time. This light might possibly have been mistaken for the signalman's hand-lamp, as it was carried to the lamp-room; and if it were so, it only proves the extreme risk to which the public are sometimes exposed from the practice which so generally prevails of starting trains from sidings by means of hand-signals.

The London, Brighton, and South Coast Railway Company have now placed a disc-signal opposite the facing points, which is worked from the signal box, to prevent a train from coming out of the ballast siding without the signalman's express permission; and this disc-signal locks the facing points, and another down semaphore signal recently placed north of this crossing. The disc signal should, however, be made to lock with the up station signal. I have also much pleasure in stating that I understand the company have given instructions to have the whole of their stations thoroughly overhauled, and similar signals to be put up, so as to do away with the use of hand-signals for starting trains from sidings situate beyond the station signals.

One other point requires to be mentioned. It is very probable that if the 8h. p.m. up passenger had been running to its proper time, no collision at all would have occurred; and it thus appeared desirable to ascertain what had caused it to be 27 minutes late in passing Caterham Junction station.

The 8h. p.m. up train from Brighton is joined at Hayward's Heath station by another train from

Hastings. Both trains consist of two portions, one for London Bridge, placed at the front of the train, and the other for Victoria station, at the rear of the train; and the two portions for London Bridge and for Victoria station have to be put together on their arrival at Hayward's Heath.

Hayward's Heath station is very well laid out for conducting a large traffic with despatch, and it is provided with a large and sufficient amount of siding accommodation; but on the day in question, the goods yard was encumbered and blocked up with a quantity of railway plant belonging to the contractor for constructing the Ouse Valley Railway, which had arrived there on the previous night and early morning; so that about 1 o'clock the station master telegraphed to the traffic manager at Brighton for an engine to shunt the waggons, &c.; and this message was handed to one of the assistants in the locomotive department, who had it copied, and sent to the locomotive department, and a message was transmitted back by the traffic manager to Hayward's Heath about 3 o'clock that an engine should be sent. It was a very busy day in the locomotive department at Brighton, and the message was handed to the locomotive foreman (the locomotive superintendent and his first assistant being absent), and the foreman told the lad that brought the telegraphic message about 1 p.m. that he had no engine to send; and none was sent, and no message was forwarded to the traffic department that no engine was to be sent.

The locomotive foreman did not consider it necessary to have the steam got up in one of the spare engines in his charge, and the assistant did not appear to think that he had power to order one to be got ready and sent. This will be remedied in future.

In the meantime and during the day several of the engines that brought trains to Hayward's Heath assisted in doing some of the shunting required, but the station master continued to expect that an engine would arrive from Brighton as promised. The Hastings and Brighton portions of the 8h. p.m. train reached Hayward's Heath about 5 minutes late, the Hastings portion first getting there, as it should do; and when it arrived the up siding south of the station

was occupied by goods trucks; and after allowing the passengers to get out, the train was moved ahead, and shunted some vehicles into the up siding north of and adjacent to the up platform; and it was then shunted across to the down main line to the south end of the station, and the engine was detached, ran across to the up road, and hauled back along the up road the Victoria portion of the Brighton train, which had by that time got alongside of the up platform, and the Brighton train was shunted back to the down line, was attached to the Hastings train, returned to the up platform, and then the Victoria portion of the Brighton train was pushed forward and was attached, and the train was ready to proceed. The Brighton train was delayed altogether about 13 minutes; much more than would have been necessary if the up siding south of the station had not been occupied by goods trucks, or if the Hastings train had been shunted, as soon as it arrived, into the up siding north of the station platform, instead of being shunted across to the down line, and the south of the station; but the station-master, who superintended the operation himself, was mistaken as to the capacity of the siding, and thought that as there were some trucks in it, there was not room for the Hastings train as well.

The extra delay at Hayward's Heath caused the 8h. p.m. up train to be preceded by the South-eastern train, which was running nearly to its proper time, in entering Reigate station, and thus it was further delayed.

Such delays will always occur in conducting traffic, but they are fortunately very seldom followed by collisions.

As the result of my investigation, I should state that the collision was evidently the result of the system of starting trains by hand signals; and it is satisfactory that this system is to be given up on the London, Brighton, and South Coast Railway.

I enclose a tracing showing the position of the ballast siding with reference to the station.

I have, &c.

(Railway Department),
Whitehall, 26th April 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London, Chatham, and Dover [London, Brighton, and South Coast] Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to enquire into the circumstances connected with the collision which occurred at the Stewart's Lane Station on the London, Chatham, and Dover Railway on the 17th ultimo.

I am, &c.
W. D. FANE.

*The Secretary of the
London, Chatham, and Dover
Railway Company.
London Brighton, and South Coast
Railway Company.*

*Board of Trade
(Railway Department),
Whitehall, 23rd April 1866.*

SIR,

I have the honor to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 20th ultimo, the result of my inquiry into the circumstances which attended a collision that occurred on the 17th ultimo between a goods train and a passenger train

at the Stewart's Lane station of the London, Chatham, and Dover Railway, on which occasion about five passengers were injured.

The Stewart's Lane station is situated adjacent to the locomotive establishment and goods yard of the London, Chatham, and Dover Railway at Battersea; and the north end of the down platform is about 200 yards from the junction with the London, Brighton, and South Coast Railway at Stewart's Lane. The Junction signals are in the hands of a servant of the London, Brighton, and South Coast Railway Company; and all engines or trains coming out from the London, Chatham, and Dover Railway yard proceed by a single line on to their up main line if they are going forward to Victoria station; whereas if it be a goods train or a passenger train proceeding towards Stewart's Lane station, it is pushed out of the yard to the up main line, and thence by a cross-over road to the down main line when the engine is in the right position for taking the train on. But no train of any length can come out of the yard for this purpose, without fouling the down main line of the London, Brighton, and South Coast Railway, and for that reason nothing is permitted to come out of the yard without the express permission of the Brighton signalman at the Stewart's Lane Junction.

The instructions to the signalman at Stewart's Lane junction are as follows:

"On and after Sunday, the 5th day of March 1865, "the interior semaphore working to your box from

" the London, Chatham, and Dover Company's
 " Stewart's Lane station for traffic from Victoria
 " will stand at 'Stop' until altered for the passage of
 " a train.

" Whilst at 'Stop' you must allow nothing to pass
 " your signals to go on to the London, Chatham, and
 " Dover line.

" So soon as a train for the Chatham and Dover
 " line is signalled to you by telegraph from Batter-
 " sea Park you must transmit such signal to the
 " Chatham and Dover signalman at Stewart's Lane
 " station by giving two blows upon the new instru-
 " ment, when (if the line is clear) he will pull off the
 " interior semaphore, and you can then let the train
 " proceed on its journey.

" In fact you will work your out Chatham and
 " Dover signal in strict conformity to the interior
 " semaphore, in precisely the same way as you now
 " work your out Brighton signal in conformity to the
 " discs working from Long-hedge Junction to your
 " box."

" Brighton terminus, Signed GEO. HAWKINS."
 " March 2nd 1865."

On the 17th ultimo the 1.30 p.m. down goods train, consisting of engine and tender and seven vehicles, including two break vans, with two guards, was ready to leave the London, Chatham, and Dover Company's yard at Battersea at its appointed hour, and the driver whistled for the signals at the junction to be taken off, so that he might proceed. He was kept waiting eight or ten minutes until the London, Chatham, and Dover Company's down passenger train, which is appointed to leave Victoria station at 1.32 p.m. had passed the Stewart's Lane Junction on its way to Stewart's Lane station, and then the Brighton signalman, at 1.38 or 1.40, gave the London, Chatham, and Dover switchman orders to let the goods train out, and he himself shifted the points of the cross-over road for the goods train to be shunted back from the up to the down main line; and when the goods train got near the Stewart's Lane Junction signal-box, the Brighton signalman gave a signal for the train to proceed towards Stewart's Lane station. He states that he told the driver to go steady to the station, as a branch train was standing there; but this is flatly contradicted by the driver, who, according to the evidence, must have been somewhere about 35 yards from the signalman's box. There is no distinct corroboration of the Brighton signalman's statement, but other parties say that he made use of the words "Go steady," or something to that effect.

The Brighton signalman gave his evidence very fairly. He says, that he signalled to the Stewart's Lane station signalman about 1.43 for the goods train, by two rings of a bell, but that he did not get any reply; and he admits that he sent the goods train on, in opposition to the instructions of the 2nd March 1865 which I have recited. He had been three years at the same box, and had always carried out the same practice with certain trains (empties in the morning, &c.), and had found it absolutely essential to break the order of the 2nd March in order to carry on the traffic,—in other words, to get the London, Brighton, and South Coast line clear for the trains belonging to three companies that run over it from Stewart's Lane Junction to the entrance to the Victoria station yard. The servants of the London, Chatham, and Dover Railway Company do not generally admit that any such practice had been introduced, but allow that it was done under special circumstances, under the authority of the Battersea Park station-master in two cases; and one or two witnesses allow that it had been done on other occasions; but I did not hear any driver admit that he had been sent on from the Junction to Stewart's

Lane station, and had found a train waiting there when he reached the station.

There is a short piece of level on the London, Chatham, and Dover line adjacent to and south of the Junction, and from thence the line rises on a steep incline of 1 in 96½ to the Stewart's Lane station, according to the plans furnished to this department prior to this line being opened for traffic, but at that time there was no station at Stewart's Lane; and the driver of an engine coming out of the yard, as this goods train did on the 17th ultimo, could not, when he stopped clear of the points of the cross-over road, see either the north end of the down platform, the carriages of a train standing alongside of it, or the Stewart's Lane station signal, owing to a curve in the line, and the recent erection of one of the piers for carrying the viaduct for the high level main line of the London, Chatham, and Dover Railway from the Victoria Bridge southwards. After running about 50 yards towards the station, the driver would come in sight of the signal, and if a good look-out had been kept, the driver would still have had time to stop his train before the engine reached the north end of the Stewart's Lane station platform. But the driver says that he had his cylinder cocks open from the time of leaving the yard, and was thus prevented by the steam from seeing the passenger train that was standing at the Stewart's Lane station down platform. He says that just before his engine struck the other train, his fireman called out "Wo;" and then he reversed his engine, and did all in his power to stop, but it was too late to effect any reduction of the speed, and the 1.32 p.m. down passenger train was struck by the goods engine while the latter was travelling at a speed of about eight miles an hour. The passenger train had been detained at Stewart's Lane station until the line was clear up to the next station in advance. There were two extra men on the goods engine that day, who were riding there by permission; and all the company's servants connected with the train give it as their opinion that it was not, at the time the collision occurred, travelling at too great speed to stop by the time it reached the station signal.

1. With respect to the causes which have contributed to this collision, I should state that it could not have happened in this instance if the instructions issued by the London, Brighton, and South Coast Railway Company had been obeyed by their own signalman. At the same time, I feel certain that the man on duty was only anxious to clear the Brighton line. His proper course long since would have been to have represented that he was obliged to break through these instructions; and then a stop signal, under his control and worked from the Junction, could have been put up between his box and the pier of the new viaduct, that would allow of London, Chatham, and Dover down trains passing along the down line till clear of the Junction points, but stopped by the signal from proceeding on to Stewart's Lane station until the signalman at that station had given "line clear" by the interior semaphore when the stop signal could be turned off.

Some arrangement of this kind is still necessary for the future, as the despatching of trains by hand signals and by calling out is constantly leading to collisions.

2. I consider the driver of the goods train was decidedly to blame in not having kept a better look-out, and I recommend that the practice of allowing extra drivers and firemen to ride on the engines when not on duty be discontinued, as it is liable to withdraw the attention of the men on duty from their work.

I have, &c.

*The Secretary,
 Board of Trade,
 Whitehall.*

W. YOLLAND,
 Colonel.

LONDON AND NORTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 7th April 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-Western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the Clifton Level Crossing on the 17th February last.

I am, &c.

J. E. TENNENT.

*The Secretary of the
London and North-
Western Railway Company.*

SIR,

1, Whitehall, 3rd April 1866.

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 6th ulto., the result of my inquiry into the circumstances which attended a collision that occurred on the 17th February at the crossing on the level of the Clifton, and Eccles, Tyldesley, and Wigan Branches of the London and North-Western Railway, between a passenger and a goods train, when the driver of the passenger train, Edward Sackfield, was killed, and one passenger was injured.

The Eccles, Tyldesley, and Wigan Branch crosses the Clifton Branch at an angle of about 75°, and the signals at the crossing are so arranged that whenever anything is passing on either line of the Clifton Branch, in obedience to the signals, the distant and crossing signals for the Eccles, Tyldesley, and Wigan Branch are of necessity all at danger. This crossing is not quite 700 yards distant from the Eccles Junction, and at a less distance from the Junction of the Clifton Branch with the siding alongside of the Liverpool and Manchester Railway at Patricroft.

The traffic on the Eccles, Tyldesley, and Wigan Branch is worked with the assistance of the telegraph, so that when any train proceeding towards that branch approaches Weaste Station, three miles from Manchester, it is telegraphed forward to Eccles Junction, and from thence to the Clifton crossing, by means of a gong, so that the signalman there may make arrangements for the line at the crossing to be clear of any passenger or goods trains on the Clifton Branch before the train arrives there.

The distance along the Clifton Branch, between the Clifton crossing on the Eccles, Tyldesley, and Wigan Line, and the sidings alongside of the Liverpool and Manchester Railway is so short, that, in taking waggons out of the sidings east of the Clifton Line, or putting waggons in, it is frequently necessary in shunting to pass across the main lines of the Eccles, Tyldesley, and Wigan Branch. No special regulations have been made as to the shunting of trains across this level crossing.

It appears from the evidence of the signalman at Clifton level crossing, that about 20 minutes before 4 o'clock on the afternoon of the 17th February, the signalman at Patricroft signalled that a goods train was backing up on the wrong line towards the crossing, and the signalman replied that the line was blocked, so that the train must come quietly, as there were some waggons standing on this line between the crossing and the Patricroft signalman, and when the goods train had arrived it stopped on the crossing exactly at 3.50 p.m., or about five minutes before the 3.40 p.m. train from Manchester to Tyldesley became due. The signalman says that he then spragged the wheels of one of the waggons, and uncoupled them about eight or nine yards on the Clifton side of the crossing, and signalled the driver of the train to draw ahead; the driver obeyed, and the rear waggon stood about the same distance on the Patricroft side of the crossing, thus leaving an open-

ing in the train at the Clifton level crossing, sufficient for passenger trains on the Tyldesley Line to pass. The signalman says the engine was then uncoupled, and went to take out some waggons out of the siding, and whilst that was going on, the 3.40 p.m. train was signalled from the Eccles Junction by the gong, and the signalman replied that the line was clear, and took off the distant and semaphore signal at the crossing for the Tyldesley train to pass. So far there is no discrepancy in the statements, and blame does not appear to be attributable to the driver of the goods train, which consisted of about 45 waggons, as he received his subsequent orders from the guard. But the signalman states, that while he was standing by the levers which move the signals, he heard something stir outside, and he ran to the door of his signal box and saw the front part of the goods train just backing towards the level crossing, whereupon he extended his arms to the guard of the goods train, signifying danger, and then turned round and saw the steam from the Tyldesley train just about the distant signal, which is 470 yards from the crossing, and he immediately put up the danger signals.

A passenger who was in the train confirms a portion of this statement, in saying that he was looking out of the window of the carriage next to the engine, and observed as they were passing the Eccles Junction that the distant signal worked from the crossing was off, but before the train reached it the signal was put on to "danger," and he whistled, and tried to make the driver and fireman of the train aware of the fact. The fireman noticed the passenger making signals at last, but did not understand what he meant.

The signalman distinctly denies having given the guard of the goods train any signal to join up the two parts of the train.

On the other hand the guard of the goods train states that after the goods train had been divided with one portion on the Clifton, and the other on the Patricroft side of the level crossing, he went to the siding and when they had taken out some waggons from it, he held up his hand to the signalman, who was then standing at the door of his box, and he put up his hand, signifying that the two portions of the train might be joined up, and he (the guard) then put up his hand for the driver to come back, and he then went to the waggons on the Clifton side of the crossing to hook the two portions of the train together, and when that was done he signalled to the driver to go ahead; but before the whole of the waggons began to move, the Tyldesley train ran into the goods train then standing across the Tyldesley lines.

The driver and fireman of the Tyldesley train, observing all right signals at the Eccles Junction and at the Clifton crossing, do not appear to have kept a vigilant look out as they ran towards the crossing, as they did not observe that the distant signal had been put on to danger against them before they passed it, and the fireman says that they were not above 20 yards from the crossing, when the driver called out "See that, Jack," and he then saw the "danger" signal at the Clifton crossing and jumped off the engine, and when he last saw the driver he was standing on the spring box, holding the regulator.

The guard of this train, which consisted of engine and tender, four coaches, and a break van, says that he saw that some waggons were foul of the line, when he was about 200 yards from the crossing, and he applied his break, but that it was too late to do any good. He says they were travelling at 14 or 15 miles an hour, but it is probable that the speed was largely in excess of that rate.

The Tyldesley train ran right through the goods train, breaking one of the waggons to pieces, damaging a second, and throwing two others off the line, and the engine and tender were also thrown off the rails, ran some 50 yards beyond the crossing, and

then down the embankment above 20 feet in height, turning over as it went down. The driver was found on the embankment fearfully hurt, and he died before they could reach Manchester.

The engine and tender became detached from the carriages, which fortunately did not leave the rails.

The collision was produced by the acts either of the signalman or guard of the goods train. I cannot pretend to say which told the truth before the coroner, and to myself; but both of their statements could not be true.

One thing however is perfectly clear, that a most objectionable practice of shunting trains on the Clifton Branch across the level crossing had been introduced, without keeping all the signals at danger while it was being done, which is the practice usually followed in station yards. It is difficult to believe that such a practice could have been long continued,

if the mode of doing the work had been carefully looked after. The crossing is as well protected as it can be by signals, but these become useless when such dangerous practices are introduced.

It is unfortunate that the Legislature ever sanctioned such a crossing on the level as the Clifton crossing, as there was no necessity for it, but level crossings of railways by other railways attract but little attention in Parliament, unless they are proposed to be made by a competing Railway Company.

I recommend that the practice of shunting trains on the Clifton Branch across this level crossing be altogether given up.

I have, &c.,

W. YOLLAND,
Col.

*The Secretary to the
Board of Trade,
Whitehall.*

MIDLAND RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 28th March 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Midland Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred near Doe Hill, on the Midland Railway, on the 16th inst.

I have, &c.

W. D. FANE.

*The Secretary of the
Midland
Railway Company.*

SIR,

Derby, 22nd March 1866.

IN compliance with the instructions contained in your minute of the 23rd ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 16th instant, near Doe Hill, on the Midland Railway.

The Doe Hill station is $3\frac{1}{2}$ miles south of the Clay Cross Junction, and 7 miles south of Chesterfield, on the direct Midland route to Trent and London. Rather less than half a mile to the north of Doe Hill, there is a siding on the west of the main line, connected with the Clay Cross Company's works, called the Moreton siding. This siding is approached from the north on a rising gradient of 1 in 161, and a curve of 85 chains radius, is under the charge of a pointsman in the service of the Midland Company, and is protected by a distant signal in each direction, that to the north being 600 yards from the pointsman's cabin, and being visible in clear weather for 550 yards further.

The 9.10 a.m. passenger train from Eckington to Nottingham, left Chesterfield at 9.33, eight minutes late, on the day in question, consisting of an engine and tender, a dummy van, six carriages, and a break-van. After making up three minutes between Chesterfield and Clay Cross, it approached the Moreton siding about 9.45, five minutes late, at a speed, according to the engine driver and fireman, of 25 to 30, or according to the guard of 12 to 14 miles an hour. The engine driver asserts that the distant signal from the siding was at "all right" as he approached it, and as he passed it, and his fireman corroborates this statement. They certainly acted as if such was the case; and in rounding the curve, which is in a deep cutting, north of Doe Hill, with their steam on, they saw a pilot engine some 250 yards before them, at the back of a goods train. They then did their best to pull up, but their engine came into collision with the tender of the pilot engine at a

speed of perhaps 10 or 12 miles an hour. The four buffers of the passenger engine, and the buffers of the tender which it struck, were all broken, and the tank of the tender was shifted on the framing. Fourteen of the passengers were injured.

The 7.35 a.m. goods train from Chesterfield to Codnor Park, which was thus in the way of the passenger train, reached the Moreton siding at 9.30 according to the guard, at 9.42 by the engine driver, at 9.45 by the pointsman. It had been assisted from Clay Cross by a pilot engine in its rear. The guard was anxious to shunt it from the up to the down main line out of the way of the passenger train; but the only means of doing so was by taking it through the siding, as there was no cross-over road between the two main lines; and 12 waggons of coals which were waiting to go forward with it, stood in its way on the siding. The train was therefore divided; the engine and three waggons were sent into the siding, to fetch out the 12 waggons of coals; these were brought out upon the main line; the pilot engine was coupled to the break van in the rear, and the two portions of the train were about to be united, in order that both engines might assist in taking it into the siding, when the passenger train came in sight.

The driver of the leading goods engine turned on his steam and ran forward out of the way as soon as he saw steam from the cutting behind him. The driver of the pilot engine had got into motion to push his waggons forward, when, on looking round, he saw the passenger train approaching, and he was moving at a speed, he believes, of 6 or 7 miles an hour, when he was struck by the passenger engine at a speed of 10 miles an hour.

The pointsman, who has been at the siding for seven months, came on duty at 6 a.m. He states, that he turned both his signals to danger as soon as the goods train had passed his north signal, and a horse driver in the employment of the Clay Cross Company, who was waiting for goods by the train, confirms this statement. The under guard of the goods train says that the south signal was at danger before the goods engine crossed into the siding; and the head guard asked the pointsman whether the north signal was at danger when he heard the passenger train in the distance, and was answered in the affirmative. It is admitted by the engine driver that the signal was at danger after the collision, and it could not have been worked by the pointsman in the interval between the passenger train's passing it and the collision, because he was nearly 100 yards away from the handle, and on the opposite side of the line.

After a careful examination of all who were on the spot, I have come to the conclusion that the signals were turned to danger by the pointsman on the approach of the goods train; that the north signal was at danger when the passenger train passed it, that the engine driver and fireman must have missed

seeing it, and that they have, in endeavouring to screen themselves at the expense of the pointsman, falsely asserted that it was at "all right." The fireman went indeed, further, and stated that he saw the pointsman coming from his cabin immediately after the collision, when it is proved by the guard of his own train and others that the pointsman was then, not only on the other side of the line, but even on the further side of the trains.

Orders have been given for moving the above north signal to a greater distance from the siding, which will be an improvement. It is desirable that

there should be a "bell-and-arm" or other good means of communication both ways between the Moreton pointsman and the station master at Doe Hill; and I am glad to learn that preparations are in progress for working this portion of the Midland Railway by telegraph.

I have, &c.

H. W. TYLER,

Capt. R.E.

NORTH BRITISH RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 7th May 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North British Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision that occurred on the 10th ultimo at Ladybank Station on the Edinburgh, Perth, and Dundee section of the North British Railway.

I have, &c.,

W. D. FANE.

*The Secretary of the
North British
Railway Company.*

SIR,

Dulwich, 1st May 1866.

IN compliance with the instructions contained in your minute of the 18th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 10th ultimo at Ladybank station, on the Edinburgh, Perth, and Dundee section of the North British Railway.

Four passengers are reported to have received cuts and bruises, but none of them were seriously injured.

The trains from Perth and Dundee, travelling to Edinburgh by the Queen's Ferry "route," are timed to meet at Ladybank, where they are joined together, and form one train from Ladybank to Queen's Ferry.

The trains from Dundee are timed to arrive at Ladybank about two minutes before the trains from Perth, and, except in cases of unusual delay, are admitted to Ladybank platform first.

When the Perth train arrives, it runs through the station, and is then pushed back, by a cross-over road at the south end of the platform, on to the line of rails from Dundee, which forms a siding next to the platform. The Dundee train stands at the platform till the Perth train is coupled to it. The engine that has previously brought in the Dundee train moves off, while the Perth train is at the south end of the station.

There are four lines of rails between the up and down platforms at Ladybank station. The two centre lines are the main up and down lines from Perth to Queen's Ferry. The down line to Dundee branches from the Perth down line at the south end of Ladybank station, and runs through the station alongside the down platform. When it reaches the north end it crosses both the main lines between Perth and Edinburgh, and goes east to Dundee.

The up line from Dundee, which runs to the up platform, is to the east of the up line from Perth, and does not join it till it reaches the south end of the platform, but there is a cross over road with facing points leading from the up line from Perth to the Dundee up line at the north end of the Ladybank up platform. The points of this cross-over road were

turned in the wrong direction by the pointsman on the 10th ultimo for the train which arrived from Perth at 11.10. a.m., and it ran into the train which had arrived from Dundee about two minutes previous while it was standing at the platform. The Perth train should have gone through the station on the line it travelled on from Perth, and there have been backed over the cross over road at the south end of the station, and returned in front of the Dundee train.

The train from Dundee consisted of a tank engine, three third class, one second class, two first class carriages, and a guard's van at the tail of the train. It was driven forward about 60 or 70 yards by the collision. The van was shifted on its frame; its break gearing and buffers were broken, two or three of the buffers of the carriages in this train were broken, and four of the passengers complained of injuries, but they continued their journey. The engine of this train was uncoupled by the shock, but none of the vehicles left the road. The Perth train consisted of an engine and tender, a guard's van next to the tender, three third class, one second, and one first class carriage. It ran into the Dundee train at a speed of three or four miles per hour. None of the passengers or vehicles in this train were injured. The driver, fireman, and guard remained at their posts, and were not hurt.

The van at the tail of the Dundee train, stood close to the points at the south end of the cross-over road.

The driver of the Perth train, who had shut off his steam as he came down the incline approaching Ladybank station, noticed that the points at the north end of the cross-over road were wrong, about 10 or 15 yards before his engine reached them. He was then about 80 yards from the tail of the Dundee train, and was travelling about seven or eight miles per hour. He whistled sharply, told his fireman to apply the break, reversed his engine, and put on steam, but could not stop his train, and the engine struck the Dundee train at a speed of about three or four miles per hour. As it was standing on an incline falling 1 in 200, and the break gearing of the guard's van was broken by the collision, it ran forward about 70 yards.

The accident was caused by a mistake on the part of the signalman, who bears a good character. He can assign no reason for his mistake, except that he had been shunting several engines that were at the station, so as to clear the main lines, and that he forgot himself.

Ladybank station is the point of junction of the Dundee with the Perth lines, and the Kinross branch also comes in on the south side of the station. There is a goods yard at the north side, with numerous sidings leading into it from the main line to Perth and Dundee. The station has been opened many years, since which time, many improvements have been introduced for working junctions and stations. It is very desirable that the whole arrangement of the station, junctions, and sidings into the goods yard, be reformed. At present there are no station signals, and the auxiliary signal towards Dundee cannot be seen

by the man working it. A proper box for the signalman should be erected on a bridge over the lines of rails, from whence all the points and signals should be worked on the locking principle.

The down main line to Perth, for the whole length of the station, is used as a siding for waggons, a loop being inserted between it and the platform for the down passenger trains.

It would appear desirable that the platform should be brought forward to the main down line.

The up line from Dundee might be better placed, at the east side of the up platform.

The cross-over road (the points of which being turned in the wrong direction) caused the accident should be taken out at once, as well as a set of facing points leading to the goods yard from the Dundee down line.

I have, &c.

Capt. R.E.

NORTH-EASTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 28th March 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North British Railway Company [North Eastern Railway Company], the enclosed copy of the Report made by Capt. Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred on the 7th inst. at the Blaydon Station on the North Eastern Railway between a North British passenger train and a North Eastern mineral train.

*The Secretary of the
North British
Railway Company;
North Eastern Railway
Company.*

I am, &c.
W. D. FANE.

SIR, *Newcastle-on-Tyne, 21st March 1866.*

IN compliance with the instructions contained in your Minute of the 16th inst., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 7th inst. near Blaydon, on the Newcastle and Carlisle section of the North Eastern Railway.

The Blaydon station is four miles west of Newcastle. There are sidings near it on both sides of the line. One of these, which I shall refer to particularly as the north siding, joins the main lines at the station, and again 300 yards on the west of it. There is a signal 245 yards to the west of the points, worked by a wire from the station, and there is a chock-block near the west end of the siding.

The 9.50 a.m. passenger train from Riccarton to Newcastle left Hexham punctually at 11.55 on the day in question, consisting of an engine and tender, four carriages, a break-van, and four loaded goods waggons. The engine-driver found the distant-signal from Blaydon at all right; but he "heard a rattle of the wire," and saw that the signal was turned to danger, after he had gone a short distance past it. He thought that something might be wrong, and he therefore reversed his engine, applied his break, and whistled for the guard's break. After going a little further he saw a waggon on the main line. He then turned on the steam against his engine, and he believes that he had reduced his speed from six or seven miles an hour, at which he had been travelling, and almost brought his engine to a stand, before he came into collision with it.

The guard heard the break-whistle after he had passed the distant-signal, and attempted to apply his break. But he had only time to "get it half on," and he does not consider that the speed was reduced to a greater extent than from seven to six miles an hour before the collision.

The side-rods and buffer-beams of the engine were

broken or damaged, the waggon which it came into collision with was destroyed, and one passenger was slightly injured out of five or six who were in the train.

The waggon which thus obstructed the main line was pushed out of the north siding, through the points above referred to as being 300 yards from the station, under circumstances which I shall next proceed to describe.

The 12 o'clock mineral train from Newcastle reached Blaydon about 12.15, and proceeded to the western points of the long siding. The foreman shunter held the points; the guard stood near a level-crossing, known as the gas-lane level-crossing, to signal to the engine-driver when he ought to bring the waggons to a stand so as to be clear of that crossing; the fireman uncoupled the engine when the waggons were in their place in the siding; and he also, as he himself states, and as the guard and foreman shunter both allege, turned the chock-block on to prevent the waggons from running, or being forced back again.

At 12.30, a goods and mineral train arrived from Redheugh, in the direction of Gateshead, on the south of the Tyne. On reaching Blaydon the engine-driver first took water, and placed four waggons in a siding south of the line. He then took 14 waggons from the main line and pushed them back into the east end of the north siding against 21 other waggons which were already standing there; and he afterwards pushed the 39 waggons then before his engine back against the 25 waggons which were on the west of the gas-lane level-crossing. The guard and the foreman shunter arranged between them, that the former should attend to the east, while the latter went to examine the couplings and to attend to the west end of the train.

When the engine-driver pushed the waggons westward in the first instance he was guided by the shunter. But when he pushed them further, to unite the 35 on the east with the 25 on the west of the gas-lane crossing, he was unable to see the guard, who was hidden from him by the steam from his safety-valves, and was obliged to trust to his own judgment. Not supposing that the chock-block was open, he expected to receive a check before going too far. But when the shunter came to him for a pin which he wanted for the shackle of one of the waggons, he told him to "hold on," as the waggons "were going out at the other end" of the siding.

The North British passenger train was now due. The waggons were hopelessly fixed, with one of them on the main line, because the shunter could not get a pin suitable for the shackle, to couple the 14th and 15th waggons together. He called to the guard to go and help him, and the guard did so, and ran to the tender for a pin. But before he could return to the shunter the collision had occurred.

The chock-block was found to be open after the collision, and it evidently had not been run over by the waggons. Inasmuch as the guard, fireman, and shunter all assert that it was shut about 20 minutes previously, when the 25 waggons were run into the

west end of the siding, the only explanation that can be offered is that some person unconnected with the company must have opened it in the interval.

But the whole neighbourhood of this siding, east and west of the site of the collision, is much in want of better protection. Between the signal-man at the station and the west end of the siding, there are a siding south of the line and an important public road level-crossing. A servant of the company should be stationed at the latter and have charge also of the former. Further to the westward, there are two tramway level-crossings belonging to Messrs. Cowen, one of which may, apparently, be dispensed with, while the other should be protected by a servant of the company; and this man should be able, by means of a pair of safety points worked by rods, to prevent

any engine or waggons from coming from the siding to the main lines except with his special permission and by his own action. These men should also be provided with suitable signals in each direction, and a chain of inter-communication should be established between them, commencing at the Blaydon station, and proceeding westward, past the tramway crossing, to the Stella Coal Staith. The view of the engine-drivers is much obstructed as far as the above colliery, and the traffic on this part of the line is heavy and on the increase.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

NORTH-EASTERN RAILWAY.

Board of Trade
(Railway Department),
Whitehall, 5th May 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council of Trade to transmit to you, to be laid before the Directors of the North-eastern Railway Company, the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the Barnard Castle station on the North-eastern Railway on the 10th ultimo.

I am, &c.

W. D. FANE.

The Secretary of the
North-Eastern
Railway Company.

SIR,

Peterborough, 27th April 1866.

IN compliance with the instructions contained in your minute of the 12th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 10th instant at Barnard Castle on the North-eastern Railway.

There is a junction east of Barnard Castle between the line from Darlington and the line from Bishop Auckland, and the stage from which the points and signals are worked is about 100 yards from the passenger platform. The line from Bishop Auckland is on a falling gradient of 1 in 70 to within 150 yards of this stage, and the line from Darlington rises towards it on a gradient of 1 in 100. There is a single line *through* the passenger station, as well as a terminal line, which I shall call the dock line, crossing it, and running south of it into the passenger shed. The former is used commonly for the Darlington trains, the latter for those to and from Bishop Auckland. On the north there are several sidings, outside of the passenger station, but connected with the main line between it and the junction.

It has been the practice, sometimes twice or thrice a week, sometimes once a fortnight or once a month, to adopt a species of *fly-shunting* with the passenger train from Bishop Auckland on the approach to Barnard Castle. When there was any vehicle in that train to be taken forward with the Darlington train, it was customary to attach it behind the engine at Bishop Auckland, to uncouple it from the carriages (while the train was in motion) about half a mile from the Barnard Castle junction, and to allow it to run with the engine into one of the sidings, while the carriages, following it at some little distance, were turned into the dock line at the station.

Some inconvenience and delay in backing the Auckland train out of the dock line at the station after

its arrival, for the purpose of shunting the vehicle for Tebay from the dock line to the through line, were thus avoided.

On the 10th April, the 1 p.m. train from Darlington for Tebay reached Barnard Castle in due course at 1.29, consisting of an engine and tender, a composite van, and a composite carriage. It was standing at its usual place, half way up the platform, and 210 yards west of the junction stage, when the engine of the Auckland train was observed to be approaching it at considerable speed. The Darlington guard jumped out of his van, on hearing some one call out; and the engine-driver endeavoured to get his train into forward motion; but the Auckland engine came into collision with it at a speed of 12 miles an hour. The tank was knocked off the tender of the Darlington engine, and the van and carriage were very much damaged. Unfortunately seven passengers were also injured.

The Auckland train consisted of an engine and tender, a carriage truck, a carriage, a van, and three carriages; the van and the last three carriages having been coupled together with continuous breaks. It left Bishop Auckland at 1.4, nine minutes late. The guard uncoupled the side chains between the truck and the carriage behind it, at Cockfield, seven miles from Barnard Castle, and there informed the engine-driver that he intended to loose the centre coupling on the incline east of the Barnard Castle junction. When a mile and a quarter from that junction, he applied his break to reduce the speed of the train, and having done so he took it off again. He then walked round the carriage which was in front of his van, along the foot-board,—detached the coupling of the carriage truck at half a mile from the junction,—returned to his van,—and re-applied his break until he got his train under control. His vehicles thus dropped back 50 yards behind the engine as they approached the junction, which was a less distance than was usual under the same circumstances. He saw the engine turned towards the station, and a porter waving his hand to the engine-driver as a signal of danger. Concluding from this that the line through the station could not be clear, he again applied his break; and he succeeded in bringing his carriages to a stand on the east of the junction stage.

The engine-driver had seen the guard passing along the foot-board of the leading carriage, to detach the carriage truck from it, at half a mile from the junction, and returning to his van. He therefore slacked off his tender-break, to allow the engine and truck to run ahead of the train; and he blew the engine-whistle three times to give the signalman warning, in the usual way, of the intended manœuvre. At 300 yards from the signal stage, he looked round, and thinking that the engine was too near the train to admit of their being turned by the signalman in different

directions, he applied "a little steam." He observed, as he approached the junction, that the points which he expected to find open for one of the sidings were set for the station; but he supposed that the Darlington train had not arrived, until he saw a porter who was at the points leading from the main passenger line to the dock line, wave his hand to him as a signal of danger. He then did his best to pull up, but his engine came into collision with the Darlington train as already described.

The signalman at the junction, who has been there for a year and a half, heard the driver of the Auckland train give, first one whistle for the distant-signal, and then three whistles, which he understood to intimate that the train was to be divided on the incline. But he could not see that any separation had taken place in it by the time that it had arrived within 100 yards of him; and he then supposed that the whistles he had heard must have been intended, as the train was travelling at considerable speed, for the guard only, to warn him to apply his break. He then observed that the engine and truck began to go ahead of the carriages, but he had not time to move his points before the engine was upon them, and he was therefore obliged to allow it to run forward into the station.

The porter at the points leading to the dock line was naturally astonished to find the Auckland engine coming towards him, when he expected it to have

gone into a siding north of the station, and hardly knowing what to do, he signalled to the driver to stop, and to the driver of the Darlington train to go ahead, and allowed the engine to run along the main line.

The mode of working which led to this collision was one attended with considerable risk in many respects, and I am glad to learn that it has been forbidden for the future. There was, however, another pair of points through which the Auckland engine might have been turned, and by means of which the collision might have been avoided, if they had been connected with the junction stage. As they are facing points for all passenger trains proceeding to the station, it is very necessary that the connection should now be effected, and that they should be made to interlock with the other points and signals. And there are other points near the junction which, as I have indicated on the spot, should be similarly treated. Some improvements are also required in the existing locking apparatus, and in the arrangement of the signals, all of which I have pointed out to the officers of the company on the spot, and which they will, I understand, immediately proceed to carry out.

I have, &c.

W. D. Fane, Esq.,
Board of Trade,
Whitehall.

H. W. TYLER,
Capt. R.E.

NORTH-EASTERN RAILWAY.

Board of Trade,
(Railway Department),
Whitehall, 25th May 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North-eastern Railway Company, the enclosed copy of the Report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred near the Scremerston station, on the North-eastern Railway, on the 29th ultimo.

I am, &c.,
W. D. FANE.

The Secretary of the
North-eastern
Railway Company.

Board of Trade,
(Railway Department),
Whitehall, 21st May 1866.

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 5th instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 29th ultimo, about five miles south of Berwick, on the North-eastern Railway, between the up night express train and a mineral waggon, which had got out of a siding, on which occasion six passengers were injured; but it is hoped that none of the injuries received will prove to be serious.

The Scremerston Limeworks are situated about a mile south of Scremerston station, and the siding, which is connected by another siding with these works, is entered from the up main line by a pair of falling points, and the entrance to the siding that leads down to the lime works is by a pair of facing points 170 yards north of those which join the up main line. These facing points are weighted to stand open for the limeworks siding, and closed to the south portion leading out on to the up main line. Stop-blocks had also been placed—one close to, but north of the facing points, to prevent anything from running down to the limeworks and the other about 50 yards north of the falling points on the up main

line; but the stop-block close to the facing points was out of order, having lost the piece which acts as a stop, and it had been so for many months past.

The railway traffic to and from the limeworks is worked by the pilot engine from Tweedmouth station, which is a little south of Berwick, which engine sometimes makes more than one trip a day to these works. No other train stops at this siding, which is protected by a little low disc signal, and by a distant signal towards Scremerston. The pilot engine takes loaded coal and empty lime waggons, and leaves them in the siding north of the facing points, and it then runs down to the limeworks, and brings out loaded lime waggons, and takes them to Tweedmouth station; while the persons employed at the limeworks take down the loaded coal and empty lime waggons from the siding north of the facing points to the sidings at those works, as they require them, horses being used for hauling them out of the siding.

On the afternoon of the 28th ult., the pilot engine took one empty mineral waggon and three loaded coal waggons from Tweedmouth to the siding, just after 2 o'clock. When they got there the guard put on the signals, and the fireman held the falling points for the train to be shunted back into the siding, which was then empty. The evidence is contradictory as to the stop-blocks being on or off. The four waggons were left in the siding north of the facing points, leading to the limeworks, the guard stating that he uncoupled the engine from the empty mineral waggon and put down its break, and the engine then went down to the limeworks and brought out three waggons loaded with lime, and the fireman held the facing points for the train to pass out on to the up main line. The guard is said then to have fastened the stop-block adjacent to the main line points by turning it on, and then putting the stop on, and the fireman to have turned the block close to the facing points across the line, but there was no stop to fasten it. The engine then took the train, by the cross-over road, to the down main line, the guard holding the points; and the fireman turned off the signals, and the train proceeded to Tweedmouth station. This occurred about five minutes before 3 o'clock in the

afternoon. The manager of the limeworks remembers the engine taking some loaded waggons away between 2 and 3 o'clock, and he believes that it put something into the siding, but he did not notice it, and that after that time none of his men went through the two pair of gates, one at the works, and the other close to the line leading to the siding, at all. He is sure of the fact, as they did not want the empty waggon or the coals until Monday.

The up night express train left Berwick for the south 9 minutes late, at 12h. 11m. a.m., on Sunday, 29th ult. It consisted of engine and tender, three carriage trucks loaded with fish, a guard's van, horse box, composite carriage, 3rd class, composite carriage, 3rd class, composite carriage, 3rd class, composite carriage and a guard's van, coupled in the order in which they are named; and the driver, who had been driving 20 years on the line, and for 15 years had driven the express train, states that he saw nothing wrong as they passed Scremerston station, but as they came to the limekilns siding he looked out for the Windmill Hill station signals, and then turned round to put on the feeds, and just then they ran into something, at which time he thinks he was travelling 45 miles an hour. He says he kept on his engine, and ran between 200 and 300 yards before they stopped, and when they did so he examined the engine and found all the machinery stripped from underneath, and a pair of waggon wheels were jammed under the front buffer beam of the engine, which wheels were still on the rails, and served as a guide to keep them to the line; but the engine and tender and every other vehicle was off the rails.

Capt. Rich was in the up express, and he states that he was asleep when the collision actually took place, but was wide awake before they had got over the 200 or 300 yards of very disagreeable travelling, due to their being off the rails, and fortunately only had one of his ankles bruised. He says that the body of the truck which was run into was across the down line of rails opposite to the guard's van at the tail of the train; that its wheels had been struck off, and the body was driven diagonally across both lines when the engine struck it. The outside rail of the down line was broken, about three rails length back from where the body remained, by the framing of the truck being driven violently against it. One of the carriages was upset on its off side, and damaged. The passengers in this carriage were most injured. A good deal of damage was done to the rolling stock, but it is very remarkable that more of the passengers were not injured, and that seriously.

The collision took place about 450 yards south of the falling points that connect the limekiln siding with the up main line. About 190 yards of the up main line were completely torn up, and 40 yards of down line were damaged.

On examination after the collision, both the stop-blocks were found off, but the lever of the facing points was said to be down, which would indicate that they stood open for the limeworks siding, in the event of any of the waggons moving southwards in the siding north of the facing points; but no one could tell how the points actually stood, whether

open or shut to the limeworks sidings, and the examination does not appear to have been a minute one.

I noticed that pieces of wood were used in these sidings to close the points by blocking them to the rails. The fireman belonging to the pilot engine stated that he pressed the lever handle down, to put the points down, after he let the pilot engine out, and that he generally did so, "because they stick a little."

No evidence is forthcoming to show in what manner this empty mineral truck got from the siding, passing through the facing points (weighted so as to turn a truck down to the limeworks), and then out on to the up main line, passing across two stop-blocks, one of which was said to be all right, and both are said to have been placed across the rails, after the pilot engine left the siding in the afternoon.

It will have been seen that three loaded waggons were placed in the siding; but Capt. Rich has stated in his report that there were two trucks, and when questioned on the subject he is under the impression that there were not more than two. If he is correct, the third truck (loaded) must have been taken down to the limeworks on Saturday afternoon; and in that case, some one must have uncoupled the empty mineral waggon, and subsequently the loaded one; and the empty mineral truck must have been moved southwards, past the facing points, in order to allow the loaded truck to go down to the limeworks, and subsequently it might have been blown out on to the up main line, which is on an easy gradient, falling to the south. The wind was from the north-east, and favourable for doing this. Another surmise is that the empty mineral truck was maliciously moved out of the siding and on to the up main line; and a piece of wood, such as might be picked up on the shore, was found on the line, with the mark of the flange of a wheel on one side, and that of the rail on the other; but I do not consider that there is sufficient evidence to support this surmise. The last up train that passed previous to the collision was the 8.35 p.m. up mail. I cannot clear up this point; but one thing is quite certain, that the arrangements of the company should have been such as to render such an occurrence absolutely impossible. If the traffic to and from the limeworks be not sufficient to call for the residence of some servant of the company at this place, the facing points should, at all events, have been kept in proper order, as well as the two stop-blocks and the facing points leading to the main line kept locked, and the key placed in the hands of the Tweedmouth station master. A distant signal towards the south is also required to protect a train crossing from the up to the down main line.

I must not omit to notice the objectionable practice of running fish trucks with this up night express train, which has been introduced, but the excuse for doing it, is the necessity that exists for bringing perishable commodities quickly to the London market.

I have, &c.

*The Secretary of the
Board of Trade,

Colonel.

NORTH LONDON RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 8th May 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North London Railway Company, the enclosed copy of the Report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the accident which occurred to a passenger train at the Victoria Park station on the 12th ultimo.

I am at the same time to request that you will inform their Lordships as nearly as possible, of the

number of passengers who were injured by the accident in question.

I am, &c.

*The Secretary of the
North London Railway
Company.*

W. D. FANE.

SIR,

Dulwich, 3rd May, 1866.

IN compliance with the instructions contained in your minute of the 14th ultimo, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended

the accident, that occurred at Victoria Park station on the 12th April last (not the 11th as reported).

Several passengers were hurt, but I understand, that none of them were seriously injured.

The branch railway from Victoria Park station to Stratford, belongs to the Great Eastern Railway Company, but it is worked by the North London Railway Company, with whose line it forms a junction at Victoria Park station.

The passenger trains which run on this branch are distinct from the main line trains and work over the branch line only.

There is only one passenger platform at Victoria Park station for the branch line. This platform is situated in the angle, between the branch and the North London main line, so that passengers alighting from the main line trains, do not cross the rails of the branch line to enter the trains on that line.

It follows, that trains proceeding from Victoria Park station to Stratford have to get on to their proper line by a cross-over road which is a short distance from the south-east end of the station.

It is the duty of one of the porters at the station to hold the points for the train to cross over. The three porters that belong to the station take this duty by turns.

On the 12th ultimo Charles Edwards was the porter for this duty. He had only been two months and five days in the company's service and it is his first employment on a railway.

He preceded the 7.12 p.m. train to the points, and was at them when the engine and train arrived, but he does not appear to have pulled them over so as to let the engine cross to its proper line, but to have done so, as soon as the engine had passed through them. The train consisted of a tank-engine, a second-class carriage with break compartment for the guard, another second-class carriage, and a first-class carriage coupled in the order given. The engine kept straight on and the carriages passed through the points on to

the cross-over road, but were dragged off the rails and the first one fell over on its near side. The other two were pulled off the rails, but did not fall over. The line from the south end of Victoria Park station towards Stratford falls 1 in 82. The points of the cross-over road are about 100 yards from the station. The train had gained a speed of about eight miles per hour, when it arrived at the points. The driver is in jail for some offence not connected with the railway which he has committed, since the accident occurred. He did not therefore appear to give me his evidence, but the fireman stated, that he shut off his steam at once and that he applied the break. The guard also applied his break and the train was brought up within 70 yards of the points.

The accident was caused by the mistake of the porter who was acting as switchman. I consider that he was rather too inexperienced in railway matters to be trusted with this duty, which, though perfectly simple, requires a man to be fully aware of the importance of doing it well and correctly.

I would suggest the desirability of a second platform for the branch and a foot-bridge for passengers over or under both the railways. The points of the cross-over road should then be worked from the junction box. This will prevent the chance of up trains coming into contact with down trains, as well as accidents of the present kind. If the company do not consider the station of sufficient importance to warrant such an outlay, I would suggest, that the cross-over road where the accident occurred be moved nearer to the station and worked from the junction box by the signalman, or that it be controlled by a low signal which cannot be lowered for drivers to start from the Victoria Park platform until the points are set in the proper direction.

I have, &c.

*The Secretary
Board of Trade,
Railway Department.*

F. H. RICH,
Capt. R.E.

NORTH UNION RAILWAY.

*Board of Trade
(Railway Department),
Whitehall 7th April, 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the North Union Railway Company, [London and North-Western Railway Company,] the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision that occurred near the Euxton station on the North Union Railway on the 21st February last.

I am, &c.

*The Secretary of the
North Union
Railway Company,*

*The Secretary of the
London and North-Western
Railway Company.*

J. E. TENNENT.

*Board of Trade
(Railway Department),
Whitehall, 31st March 1866.*

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 6th instant, the result of my inquiry into the circumstances which attended a collision that occurred on the 21st February near Euxton Station, on the North Union Railway, between an express passenger train and an empty engine, when four passengers and two of the companies' servants were injured, two of the passengers rather seriously.

It appears that on the night in question, the bank engine had assisted the 9.50 p.m. up goods train up the inclines from Preston station to Coppul, a distance of about 10 miles, on the North Union Railway, now

worked by the London and North-Western Railway Company, and the bank engine left Coppul to return to Preston about 10.50 p.m. and passed Balshaw Lane level crossing, seven miles from Preston, going very slow, about 11 o'clock p.m.

The gatekeeper at the level crossing states, that he usually watches trains that pass his crossing until they reach Euxton station, three quarters of a mile distant, and on looking after this engine, he saw that it carried a bad light at the rear of the engine, which was returning to Preston with the tender in front, and he thought the engine appeared to come to a stand still, and in consequence he turned the gate signal lamp on to danger, and put down a fog signal about 40 yards on the Coppul side of the level crossing.

In about 15 minutes the 5.0 p.m. down express passenger train approached his crossing; he saw it a long distance before it reached the crossing, and he showed a red light towards it with his hand lamp as well as with the gate signal lamp. He says that he noticed the guard of the express train put on his break about 100 yards or more before he reached the crossing, but he did not hear any whistle from the train, which passed at a good speed, and which ran into the bank engine about 340 yards on the Euxton side of the crossing, at a speed estimated by the driver of the express train at 25 miles an hour. The effect of the collision was to throw the engine and tender of the express train off the line, fouling both lines of way, to break the buffer beams and buffers off the engines, and to push the bank engine a long distance ahead, and to injure four out of the six passengers who were in the train in addition to an inspector who was riding on the engine and the fireman. Fortunately the inspector had time to reach Euxton station, which was more than a quarter of a mile nearer to Preston than the spot where the collision

took place, in time to have the up station signal put on to "danger" and thus to stop the up limited mail, or another collision might have ensued.

The 5.0 p.m. down express train consisted of engine and tender, one composite carriage, one break van, and four carriage trucks. It left Warrington about six minutes late, and was apparently travelling at its regular rate, which from Coppul to Preston is generally very fast, in order to make up for slow travelling up hill from Wigan to Coppul. This portion of the line is worked with the assistance of the electric telegraph, and on the partial block system, and I was informed that when the "all clear" signal had not been received from the station in advance, it was customary to stop the following train, and to tell the driver that there was a train on the line in front; but on this day, the telegraph wire between Coppul and Euxton Junction Telegraph stations, about $3\frac{1}{2}$ miles apart, had broken, so that it was not possible to make use of it over this length, and the traffic was conducted on the original system of a time interval between following trains. The driver of the express train did not know but that he was working on the telegraphic system, and there is no doubt that a less vigilant look-out is kept when it is known that the traffic is conducted on the block system, or partial block system, by the assistance of the telegraph, than when the traffic is worked only with an interval of time between following trains. The line was straight for a very long distance, and if a vigilant look-out had been kept, the Balshaw Lane gate signal and the gatekeeper's hand lamp should have been seen at a sufficient distance to enable the express train to have been stopped short of the spot where the collision occurred; as it was, the gate signal lamps, the gatekeeper's hand lamp, and the lamp on the tail of the

bank engine, were seen nearly at the same time, but not before the express train was very close on the crossing; the driver reversed his engine and the fireman and guard put on their breaks, but the distance was too short, with the proportion of break power allotted to the train, to enable it to be stopped short of the bank engine.

The bank engine after passing the level crossing had stopped for want of steam. As I have already stated, it was running tender foremost, which is not a favourable position for raising steam; and great blame is due to the driver for not having sent back his fireman in order to stop the down express train, as there was abundance of time to have done so. He had been discharged from the Company's service and I did not see him.

I am also of opinion that the driver and fireman of the express train are to blame for not having kept a better look out, as the signal at the level crossing should have been carefully looked for. But it appears that this signal lamp is without a reflector and cannot be seen above 600 yards, and it is therefore essential that it should be replaced by a good lamp of modern construction.

I beg also to recommend that when any interruption occurs in the working of traffic by the telegraph, on the block, or partial block system, so as to render it necessary to revert to the time interval until the telegraphic instruments can be put into proper working order again, the drivers of all trains should be cautioned and made acquainted with the change which has been made.

*The Secretary of the
Board of Trade,
Whitehall.*

I have, &c.
W. YOLLAND,
Colonel.

VALE OF NEATH RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 5th May 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Vale of Neath Railway Company (Great Western Railway Company) the enclosed copy of the report made by Capt. Tyler, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred near the Aberdare station of the Vale of Neath Railway on the 27th March last.

I am, &c.

W. D. FANE.

*The Secretary of the
Vale of Neath
Railway Company.
The Secretary of the
Great Western
Railway Company.*

SIR,

No. 1, Whitehall, 26th April 1866.

IN compliance with the instructions contained in your minute of the 16th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the collision that occurred on the 27th ultimo, between a passenger train and a goods train, near Aberdare, on the Vale of Neath Railway.

There are two stations at Aberdare, on different levels, but within some 20 yards of each other. The original low-level station was formerly the terminus of the Aberdare branch of the Vale of Neath Railway, but there being no communication through it, it is only used now for one passenger train each way daily.

The high-level station, opened for traffic in 1864, has a single *through* line of rails passing a one sided passenger platform; and this line of rails carries the traffic of the Great Western system to and from the

important district north and west of Aberdare. The number of trains passing through Aberdare has already increased from 23 up to 63, including both ways, daily, and the increase may be expected to continue rapidly as the resources of the district are developed.

The terminal line and the through line from the above stations meet at Gadlys junction, about 320 yards to the west of them. The signalman at this junction communicates by a gong with a second signalman, 240 yards west of him, at Gadlys crossing, and the latter works a distant signal near a level crossing at Mill Street, 720 yards from the junction box. The gatekeeper of this level crossing has two signals at the crossing, and a distant signal to the west of it.

There is a considerable descent from Hirwain, on the west, for $3\frac{1}{2}$ miles, to Aberdare, the gradients being as follows on the immediate approach to Gadlys crossing:—1 in 67.5 for 27 chains,—1 in 49 for 24 chains, to the crossing distant signal,—level for two chains,—1 in 74 for 20 chains,—and 1 in 156, on which the collision occurred, for $2\frac{1}{2}$ chains, to the crossing signal-cabin.

The line is worked by the block system of telegraph between Gadlys junction and Hirwain on the west, and between Gadlys junction and Cwmbach on the east or south, there being also an intermediate telegraph box at Gelly Tarw, $2\frac{1}{4}$ miles west of Aberdare, and a train staff being used for trains proceeding from Gadlys junction to sidings short of Gelly Tarw.

On the 27th ultimo, the 9.12 passenger train from Hirwain left that station at 9.14 for Aberdare, consisting, in the following order, of a tank-engine, a break-van, a first-class carriage, a second-class carriage, three third-class carriages, a composite carriage and a break-van. It conveyed 35 passengers, and weighed altogether about 76 tons, of which 38 tons were on wheels to which break-blocks were applied, 24 on the four (coupled) driving wheels of the engine, and 14 on the wheels of the two break-

vans. But the carriages with continuous breaks which are commonly used, and which ought always to be used on this line, had been sent away for repair, and an extra carriage was attached to the train.

The engine-driver states that he travelled at his usual speed towards Aberdare; that he found the distant-signal from the Mill Street crossing at its ordinary position of caution, and the distant-signal from the Gadlys crossing at its invariable position of danger; and that the latter signal is very often kept "on" until he is close to it, and has been several times kept "on" without any apparent necessity until he has passed it. On this occasion, it was kept at danger while the Mill Street crossing main signals were turned to all right. He had not applied his steam at all after leaving Gelly Tarw; he turned on his tender break, and whistled for the guards breaks, at 600 or 700 yards from the Gadlys distant-signal; and he reversed his engine "just after he had passed" the Gadlys distant-signal, on finding that signal still at danger. His view was obscured as he approached the Gadlys crossing, by a curve, and by the steam of an engine which was standing in a siding on the west of that crossing; and he only perceived, at 200 or 300 yards from it, that there was a goods engine with its train in front of him on the main line. He then applied steam against his engine, but too late to enable him to pull up short of this obstruction, and he struck the goods engine at a speed, stated to have been, but which probably exceeded, six miles an hour.

The buffer-plank, and the ends of the framing of the tank-engine, were broken, the carriage next behind the leading break-van was lifted up, and the second-class carriage behind it ran in under it; and both of these carriages were broken to pieces. The tender of the goods engine, which was in front of it, was also much damaged, the tank having been forced off it, and the framing doubled up. The drivers and firemen of both engines, as well as the second guard in the front van of the passenger train, jumped off before the collision. Thirteen of the passengers were unfortunately injured, including Mr. Thomas, an inspector in the service of the company, who has since died.

The goods train consisted of a tender and engine, 28 empty, five loaded waggons, and a break-van. It was duly telegraphed from Cwmbach to Aberdare, and reached the latter station at 9.15 or 9.16. It was detained there about three minutes by a truck being off the rails in front of it, and was started towards the Gadlys junction about the same time that the passenger train was due from Hirwain. There were altogether about 190 trucks or waggons in the Aberdare yard, and the sidings were so far blocked up that this goods train could only be got out of the way of the passenger train by sending it forward past Gadlys junction to Gadly's crossing, to shunt back into the old station. The station master, the junction signalman, and the yard foreman, all signalled or signed to the engine-driver to go forward for this purpose, in the face, as it were, of the passenger train. And the engine-driver had gone a short distance past the Gadlys crossing when the passenger train came into collision with his engine as above described.

The causes of this collision are sufficiently obvious. Nothing can justify the mode of working that was adopted, of sending the goods train forward past the Gadlys junction when a passenger train was approaching in the opposite direction, and the line had been telegraphed clear for it to that junction, at the foot of steep gradients, and to a position in which it was practically only protected by a distant-signal not well seen from a distance. Not only was this mode of working opposed to the general tenour of the regulations, and to the principle of working by block

telegraph, but it was also in direct disobedience to special rules which had been issued in writing by the station master to the signalman with regard to this particular portion of line. But it was, in fact, the practice to disobey these rules, for the want of additional facilities for working the traffic; and I find that the station master had made applications for increased accommodation without having been able to obtain it.

I recommend that the Aberdare station be now reconstructed, with a double line through it for through traffic, and more convenient siding arrangements;—that the distant signal from the Gadlys crossing be moved to a greater distance from that crossing, and be made more conspicuous;—that the gateman at the Mill Street crossing be instructed to keep his main and distant-signals at danger whenever the distant-signal from the Gadlys crossing is at danger;—that he be provided with a means of inter-communication with the junction signalman;—and that the sidings east and west of the Gadlys crossing box be connected together, so that a goods train may be able to reach that crossing without passing along the main line. Several other improvements are required in matters to which my attention was directed while on the spot, by the coroner, Mr. Winton, before whom the inquest was held on the view of Mr. Thomas's body. It would be better if the arrow-head signal were removed from the Mill Street crossing, where there is also a cross-bar main signal; if a distant-signal were worked from that crossing towards Aberdare; and if signals were added for the protection of Thomas's colliery branch. A tunnel under the line is much wanted on the approach to a number of cottages east of the Mill Street crossing, and a bridge over the line for the tramway near Gadlys crossing, which would be alike advantageous to the Great Western Railway, the Taff Vale Railway, the Gadlys works, and the travelling public. The goods trains appear to be frequently uncontrollable in passing these places. A larger turn-table is also much wanted at Aberdare, and the telegraph signalmen should be provided with speaking instruments in addition to the block instruments on which they telegraph the trains.

The printed regulations under which this part of the line is worked are also much in want of revision. The special book for the Vale of Neath section is, in fact, a collection of rules, issued from time to time, bound up together, in a state to defy reference with the prospect of any satisfactory result by the class of men for whose use it is intended. The Great Western printed regulations of October 1865, for engine-drivers, firemen, and fitters, containing also a section applying to the Vale of Neath Railway, state that "distant-signals must not be relied upon to protect any train standing between them and the main station signal," and that any such obstruction must even be 200 yards beyond the main signal. These rules, given to an engine-driver for his guidance, afford him but too good an excuse when, as in the present case, he does not appreciate a distant-signal at danger at its proper value, expects it to be turned off as he approaches it in answer to his whistle, and does not use his best exertions after passing it at danger to bring his train to a stand until he sees an actual obstruction on the line before him. Another disadvantage in these regulations is that they are contradictory to those of the Vale of Neath section, which again are not precisely in accordance with each other, as regards the way in which distant-signals should be obeyed.

I have, &c.

*Board of Trade
(Railway Department),
Whitehall, 24th July 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Eastern Railway Company [the Great Northern Railway Company], the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the accident which occurred on the 31st May last to a Great Northern passenger train, whilst running over the Great Eastern Railway, between Foxton and Shepreth.

I am, &c.,
W. D. FANE.

*The Secretary of the
Great Eastern Railway
Company.*

*The Secretary of the
Great Northern Railway
Company.*

*Board of Trade,
18th July 1866.*

SIR,

IN compliance with the instructions contained in your minute of the 7th June 1866, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the accident that occurred on the 31st May last, between Foxton and Shepreth stations, on the Great Eastern Railway, to a passenger train belonging to the Great Northern Railway Company.

Several passengers were slightly bruised, but none are reported to have been seriously hurt. The railway from Cambridge to Shepreth belongs to the Great Eastern Railway Company, and is maintained by that Company. The part between Shelford junction and Shepreth station is used for passengers by the Great Northern Railway Company only. The Great Eastern Railway Company have ceased to run passenger trains on that portion of their line since March last, but they still continue to maintain it.

On the 31st May the Great Northern train, which was timed to leave Cambridge at 7.10 p.m., did not leave till 7.18 p.m.

The delay in starting appears to have been caused, principally, by the necessity of adding another carriage to the train after it had been formed up at the starting platform.

The train, when completed, consisted of an engine and tender, a guard's van, a composite, a first class, a composite, two second-class carriages, and a guard's van, coupled in the order given.

It was timed to run to Hitchin, which is $26\frac{3}{4}$ miles from Cambridge, in 55 minutes, and it was to stop at Mildreth, Royston, and Baldock stations, besides slackening speed at Shelford junction, at Harston Bridge, which was undergoing repair, and at Shepreth station, to drop the train staff or ticket. Allowing 10 minutes for these delays, the speed at which the train had to travel was between 35 and 36 miles per hour, so as to keep time.

On the 31st May it proceeded all right from Cambridge, till it passed through Foxton station. It was due to pass that station about 7.21 p.m., and it passed about 7.33, according to the evidence of the Foxton station master, and about two minutes earlier, according to the evidence of the guard of the train, and other witnesses.

The driver does not appear, therefore, to have made up the time which was lost in leaving Cambridge, by travelling at unusual speed as far as Fox-

ton station. He states, that he passed Foxton at 25 to 30 miles per hour. The guard estimates the speed at 25 miles per hour, and the Foxton station master stated, that the speed on the 31st May was greater than usual, and estimated it at 50 miles per hour; it probably was 35 or 36 miles per hour, judging from the effects, and the speed at which the train was timed to run.

When the train got about 500 yards west of Foxton station, the guard, who was in the van, at the tail of the train, noticed that the leading van was jumping, and that it was off the rails; he applied his break at once. The driver of the train appears to have felt his engine jump, and to have noticed the van off the road, about the same time as the guard, as he whistled for the guard's break, told his fireman to apply the tender break, and reversed his engine, immediately after the guard had applied his break. The train travelled 484 yards from the spot where the van got off, before it was stopped. The road was not much injured.

A mark at the end of one of the near-side rails, just before the marks on the ballast, showed where the van got off. The joint chair at this spot was broken across the sole, and the preceding rail, at the same side, was described by the Shepreth station master, as bent outwards, and by the foreman of the plate-layers in charge of the road, as being somewhat down in the centre. The rails, up to the place where the train was stopped, are said not to have been much disturbed, but two were knocked out on the north side at the place where the last carriage of the train stopped; small pieces were knocked off the ends of the two cast-iron girders of an under bridge over which the train passed, a hole was made in the centre of the wooden platform of the bridge, and about eight or nine chairs are reported to have been broken.

The engine, and the van at the tail of the train, were the only vehicles on the rails when the train came to a stand.

The van next to the engine was off the rails, the composite carriage next to it was turned over the bank, on its side, the first-class carriage and composite that came next, were partly over the bank, hanging by the couplings, and supported by the telegraph post. The next two second-class carriages were standing on their wheels, but were off the rails on the north side of the line.

The permanent way consisted of a single-headed rail, which weighs 65 lbs. per lineal yard. It is laid in 15 feet lengths, and is carried in large iron castings, commonly called cast-iron sleepers.

The castings that take the joint of the rails are 3 ft. 9 in. long, and weigh 1 cwt. each. The intermediate castings are 2 ft. 9 in. long, and weigh $\frac{1}{2}$ cwt. each.

There are three castings to each length of rail. Those at the joints are tied to the proper guage with strong wrought-iron bars.

These castings, or cast-iron sleepers, as they have been broken from time to time, have been replaced with transverse wooden sleepers. Three sleepers have been inserted in place of the joint castings, where the latter have been broken, and one intermediate sleeper, where the rails have been out of gauge, or shown other deficiencies about the centre.

The cast-iron joint chairs used with the wooden sleepers weigh about 33 lbs., a few are only 26 lbs. The other cast-iron chairs weigh about 28 lbs. each, and some of them only 16 lbs. These chairs were fastened to the transverse wooden sleepers, with wrought-iron spikes.

It was one of the joint chairs that gave way on the 31st May.

The length of rail next preceding the broken joint chair appears to have wanted support about the centre. There was no intermediate sleeper, and the joint chair appears to have given way, under the additional strain that was brought on it, in consequence of the want of support about the centre of the rail.

The line at the place is straight, and the gradient rises 1 in 1270 towards Shepreth. The cast-iron sleeper road is now almost obsolete, and the substitution of three transverse sleepers, with 26 to 33 lbs. joint chairs, and 28 and 16 lbs. chairs at each side, without fish plates; for the old cast-iron joint sleepers, which weigh 1 cwt. each, do not make a railway fit to run over at express speed, or with trains timed to travel 30 to 36 miles per hour.

The accident was caused by running at too high speed over a weak and indifferent road, and I recom-

mend, that the speed of all trains be reduced to 20 miles an hour, till such time as a good rail, properly fished, and laid on wooden sleepers is substituted for the present road.

It appears that the driver of the Great Northern train, previous to the accident, had made some remarks relative to the bad state of the road, to the sub-inspector of permanent way of the Great Eastern Railway Company, who was in charge of the Shelford and Shepreth section of the line, but he had never made any report to his own officers, who were the proper persons for him to report it to.

I have, &c.

F. H. RICH,
Capt. R.E.

*The Secretary of the
Board of Trade,
Railway Department.*

GREAT NORTHERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 30th June 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the directors of the Great Northern Railway Company, the enclosed copy of the report made by Captain Rich, R.E., the officer appointed by their Lordships to inquire into the circumstances connected with the double collision between goods trains which occurred in the Welwyn Tunnel on the Great Northern Railway on the 9th inst.

I am, &c.

W. D. FANE.

*The Secretary of the
Great Northern
Railway Company.*

SIR,

Dulwich, 22nd June 1866.

IN compliance with the instructions contained in your minute of the 11th inst., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances which attended the double collision that occurred in the Welwyn Tunnel on the Great Northern Railway, on the evening of the 9th inst., by which two men lost their lives and two others were injured.

There are two tunnels close to Welwyn Station on the north side.

The first tunnel is about 330 yards from the station, and is 448 yards long. The second (in which the collision occurred) is about 400 yards further north, and is 1,066 yards long. The railway, which is a double line through both tunnels, is straight, and rises towards Hitchin on a gradient of 1 in 200. The line is worked by telegraph on the interval system.

There is a telegraph signal station at Welwyn, and one at Knebworth on the north side of the tunnels. These telegraph stations are about $3\frac{1}{2}$ miles apart. The regulations of the Great Northern Railway are, that the signalman at Welwyn shall not allow a train to pass his station and enter the tunnel till he has received a telegraphic message from Knebworth, to say that the preceding train has cleared the latter station. At 11.20 p.m. on the 9th inst., a train consisting of an engine and tender, 38 empty coal trucks, and a guard's van, was allowed by the signalman at Welwyn to pass his station and proceed northward through the tunnels. This train passed through the first tunnel, and had got about 400 yards into the second tunnel when one of the tubes in the boiler of the engine burst, and in consequence of the water getting to the fire the engine had not sufficient power to draw the train, which came to a stand.

The driver sent his fireman back to the guard, who was in the van at the tail of the train, to ask what he was to do.

The guard Wray looked out of the window of his van, and replied that the driver was to push the train backwards to Welwyn station, which, owing to the falling incline, he might have done; but the driver, very properly refused to push back the train, it being dangerous to do so, and directly contrary to the regulations of the Great Northern Railway Company. The guard Wray should have got out of his van and gone back to protect his train, but he neglected this important duty, and was killed by the first collision. Rawlins, a servant of the Metropolitan Railway Company, who had formerly been employed at New England on the Great Northern Railway, was travelling in the van with the guard. He was so severely injured, that he died on the morning of the 12th inst. His travelling in the van was contrary to the regulations of the Great Northern Railway Company.

About 11.36 p.m. a Midland goods train, consisting of an engine and tender, 26 goods waggons, and a guard's van, arrived from London. The signals at Welwyn were at danger as this train approached Welwyn, and the driver slackened his speed, but when he got about 300 yards from the distant signal both it and the station signal were lowered for him to pass, and he stated that he entered the tunnel at a speed of about 20 or 25 miles per hour, and ran into the train of empties when he got about a third of the way through the second tunnel. The tunnel was full of smoke and steam, and the Midland driver got no notice of the danger, as he could not see the red lights on the guard's van, at the tail of the train of empties, till the moment that his engine struck the van.

His engine was knocked off the rails, and he was jammed against the fire box by the coals from the tender. He stated that he took about two minutes to disengage himself and assist his fireman and that then he heard an up train coming into the tunnel at the northern end. He started with his fireman to run towards Welwyn, which he had some trouble in reaching, as he had to climb over the "debris" of his train in the tunnel. He and his fireman had not got clear of their train when a Great Northern fast goods up train, consisting of engine and tender, 31 waggons, and two vans, came into collision with such waggons of the train of empties as had been thrown on to the up line by the collision with the Midland down train. The engine of the up train was thrown off the rails against the side of the tunnel; but what number of trucks of each train were thrown off could not be ascertained, as about four hours after the collision part of the trains in the tunnel caught fire and continued to burn till the afternoon of the 11th inst. Thirty trucks were burnt, and the engine of the Great Northern up train was a good deal injured by the fire. Fortunately, the drivers and firemen of the Midland goods and of the Great Northern up train escaped out of the tunnel immediately after the collision, and both Wray and Rawlins were found and got out before the fire took place.

The fire appears to have been caused by some of the naphtha from the lamps that the men were using whilst clearing the tunnel, having dropped in a burning state amongst a truck load of furniture, which had been packed in shavings, and which was scattered about in the tunnel by one of the collisions.

When the Midland down goods approached Welwyn about 11.36 p.m., the signalman at that station had not received the telegraphic notification from Knebworth that the train of empties which he had allowed into the tunnel at 11.20 p.m. had passed Knebworth, and therefore, before lowering his signals for the Midland goods, he telegraphed to the Knebworth signalman, to know if the train that entered at 11.20 had passed out. The Knebworth signalman stated most positively that he answered "No;" but the Welwyn signalman stated with equal decision that he received "Yes" in reply, and consequently that he lowered the signals for the Midland goods to pass in. This answer was received at 11.36 p.m., but the Welwyn signalman, considering that the telegraph announcing that the train of empties had passed Knebworth must have been sent at 11.30 p.m., when he was attending to the telegraphs relating to an up train, and that he must have missed observing it, entered the reply to his question as if he had received the telegraph notifying that the empties had passed Knebworth at 11.30 p.m. This was an incorrect entry, which he should not have made, and I am inclined to believe that the answer that he received was "No," but that in the hurry of the moment he read the "No" as "Out," which are somewhat similar on the telegraph instrument. "Out" would bear the same significance to him at that time as "Yes." The Welwyn signalman also disobeyed his instructions by the manner in which he asked whether the 11.20 train had passed out of the tunnel. He should have merely telegraphed to Knebworth, "train waiting."

The telegraph working at Welwyn and Knebworth is done with a single instrument, which is a speaking instrument with "Out" and "In" marked on it. The needle is pushed to the same side for "Out" and for "No;" the number of beats being the difference between them, and I think the Welwyn signalman mistook the reply sent from Knebworth.

The Knebworth signalman is borne out in his statement that he answered "No" by his refusing to acknowledge the "train in" signal which was given by the Welwyn signalman at 11.38 p.m. for the Midland goods. It is possible that he may have hastily replied "Yes," and immediately afterwards recollected, that there was a train in the tunnel, which was the case a short time since at Whitehaven; but I am more inclined to believe that the mistake was made by the signalman at Welwyn. I do believe that both signalmen intended to speak the truth, and that each feels confident in his own mind that the other committed the mistake.

The tunnel was not much injured. It appeared to have been originally a very good piece of work.

The bricks were burnt about $1\frac{1}{2}$ deep, and the air-shaft was a good deal split and cracked with the heat of the fire. The Great Northern Railway Company had cut out the burnt parts of the brickwork, and were proceeding with the repairs when I was there on the 12th inst.

The tunnel was cleared about 9.30 p.m. on the 11th inst., and the traffic commenced to pass through it at 3 a.m. on the 12th inst.

This melancholy accident was caused by the neglect of guard Wray, who appears to have remained quietly in his van at the tail of the train of empties for about 16 minutes after his train came to a stand, instead of obeying the regulations of the Great Northern Railway Company, which specially provide that the guards in such cases shall proceed back one mile to protect their trains, or till they meet another servant of the company, with whom they can arrange for the safety of their train, and that they shall not trust to the protection of the telegraph.

Secondly, a mistake occurs between the signalmen stationed at the north and south ends of the tunnels, who are charged with the protection of the interval by the telegraph, and who are not permitted to allow two trains travelling in the same direction to be in the interval between their stations at the same time.

The engine that broke down was built by Mr. Sizors of Leeds. It was delivered to the Great Northern Railway Company on the 14th March 1865, and had run 40,936 miles up to the 25th May 1866.

The tube that burst was a 2 in. copper tube. Its weight when new was between 24 and 25 lbs. and when taken out of the boiler after the accident it weighed $22\frac{1}{2}$ lbs. The part that burst was close to the fire-box at the upper side of the tube just where the flame strikes it. The engine was reported to have been in good order when it left London, and there is no reason to suppose otherwise, as the bursting was no doubt a sudden thing.

The Great Northern Railway Company are changing their system of telegraph. It is very desirable for them to do so and to adopt instruments for working the line which shall have the means of blocking over the needle to "line clear" or "line blocked," and to have separate speaking instruments.

I would also recommend a strict enforcing of the regulation that requires the guards to go back at once to protect their trains where they are stopped by unavoidable accident, as on the 9th inst.

There is no doubt that this most necessary precaution for the safeworking of all railways is too often neglected.

I have, &c.

*The Secretary of the
Great Northern
Railway Company.*

F. H. RICH,
Capt. R.E.

GREAT NORTHERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 16th July 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the Great Northern Railway Company, the enclosed copy of the report made by Captain Tyler, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the accident which occurred to a passenger train on the 3d instant, near Royston, on the Hitchin and Cambridge Branch of the Great Northern

Railway, recently transferred to that Company from the Great Eastern Railway Company.

I am, &c.

*The Secretary of the
Great Northern
Railway Company.*

W. D. FANE.

SIR,

Hampton Court, 10th July 1866.

IN compliance with the instructions contained in your minute of the 4th instant, I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of

my inquiry into the circumstances which attended the accident that occurred on the 3d instant, near Royston, on the Hitchin and Cambridge Branch of the Great Northern Railway.

The 10.20 a.m. passenger train from Hitchin, for Cambridge, left Hitchin at 10.25 on that morning, consisting of a tank-engine, two first-class carriages, and two second-class break-carriages, one behind the engine, and the other, in which the guard rode, at the tail of the train. It ran as usual for $10\frac{3}{4}$ miles, but about 2 miles from Royston the engine left the rails, and, after running along the ballast for 60 or 70 yards, turned to the left, and rolled over into a field, a few feet below the level of the line. The couplings having become detached, the carriages ran forward about 30 yards further, when the leading break-carriage fell over on its side, close to the Litlington level crossing, and the others were brought to a stand, on their wheels, and in their proper order, but off the rails, behind it. The leading carriage was much damaged, and the front end of the first-class carriage behind it was stove in. The front axle of the leading carriage was bent, so as to throw the wheels about $\frac{3}{8}$ ths of an inch out of gauge, and the left wheel was strongly marked, apparently by blows which it received by coming into collision with the left trailing wheel of the engine, on which corresponding marks were observable.

The driver and fireman were unfortunately killed on the spot, and nine passengers were injured, of whom two were in the employment of the Great Northern Railway Company, and seven were workmen engaged on the telegraph.

The engine that thus left the rails was a *single* tank-engine, with cylinders (inside the framing) 15 inches in diameter, and a stroke of 20 inches. It had only run 330 miles since its last thorough repair, completed in December 1865, before being set to work in April on the Cambridge Branch. It has since that time run 6,647 more miles. There were compensating levers between the driving and the trailing springs. The total wheel-base was 16 feet 6 inches, of which 5 feet 9 inches was between the leading and driving axles. The total weight, as found at Hitchin subsequently to the accident, was 22 tons 18 cwt. 2 qrs., of which 8 tons 3 cwt. was on the leading, 7 tons 15 cwt. on the driving, and 7 tons 0 cwt. 2 qrs. on the trailing wheels. The tyres of the wheels were much marked, and those of the leading wheels, evidently from running over the chairs. The inside right driving spring was broken, apparently as a result of the accident; and as the right leading spring presented a suspicious appearance, I requested that it might be taken to pieces. Out of 16 plates of which that spring was composed, the two highest were fractured under the buckle, and the appearance of the fractures left no doubt that they must have occurred some time previous to the accident. The height of this spring inside the buckle was $5\frac{1}{4}$ inches, while the opposite, or left leading spring, was composed of 14 plates, and was 5 inches high.

This engine was, as a tank engine, adapted to run steadily, though it could not be expected to travel so steadily or to be so safe as a tender engine, and particularly on a bad road, such as that on the Cambridge and Hitchin Branch; and, indeed, it is not desirable to employ tank engines with passenger trains.

The permanent way was laid with double-headed rails weighing 72 lbs. to the lineal yard, and in lengths of 16 feet. The joints of the rails were not fished. The chairs weighed 40 lbs. each under the joints, and 21 lbs. each under the intermediate portions of the rails, and were of the old Great Northern pattern, with large holes for treenails. The sleepers were only four in number under each rail, at distances of about 3 feet 8 inches apart at the joints, and 4 feet 4 inches apart under the intermediate portions of the rails, from centre to centre. The chairs were fastened to

the sleepers, partly by treenails only, partly by tree-nails with spikes through them, and partly by iron spikes in wooden ferules.

At 70 yards behind the point where the engine turned into the hedge, there was a flat place on a rail on the left, where it had been struck on its west end as if by the tyre of a wheel. Forward from this flat place on the rail, the chairs were marked on the inside of the right rail as if from the flange of a wheel-tyre, and new chairs had been inserted under the left rail for three rail-lengths, or 16 yards. The end of a rail on the left was there still more heavily indented, as if by another wheel, or other wheels, passing over it; and a line, about four feet in length, showed where the flange of a wheel-tyre had run along it before dropping off on the outside. From this point the line was more or less broken up as the result of the accident. It was observed after the accident that the rails were in a *wavy* condition for some 220 yards towards Hitchin.

This last condition of the line must have been produced, at least in part, by the passage of previous trains, in consequence of the weakness of the permanent way from the distance between the sleepers, some of which were in the last stage of rottenness. And I am of opinion that the left leading wheel of the engine mounted the left rail at the first flat place above referred to; that the leading wheels there left the rails, marking the chairs on the right, and fracturing those (which would not for any other cause have been replaced by new ones) on the left; that the left driving wheel mounted the left rail at the second indented joint; that the driving wheels there dropped off the rails; and that the engine, in its further progress, until it turned off altogether to the left, so tore up the permanent way as to cause the carriages to leave the rails in its wake.

The wavy condition of the line, the broken spring on the right leading end of the engine, and especially the two defective joints which the engine must have met with to enable the wheels to mount the rails, as shown by the marks upon them, all contributed to cause the accident.

I find that this portion of railway, which had been for some 14 years in the charge of the Great Eastern Company, was taken over, at the expiration of the agreement under which it was worked, by the Great Northern Company, on the 1st April last. I learn from the engineer of the Great Northern Railway that he inspected it, with the engineer of the Great Eastern Company, in December 1865, and that he then required that 11,400 new sleepers should be inserted in the permanent way; but this not having been done, the same number of new sleepers were handed over to the Great Northern Company, with the line, in April. Out of 18 miles of double or 36 miles of single line thus taken over, 11 miles have since been re-laid, with fished joints, and sleepers 2 feet apart at the joints, and 2 feet $9\frac{3}{4}$ inches apart in the intermediate spaces; besides which, 5,000 new sleepers have been inserted by the ordinary gangs. I am glad to learn also that, in addition to a greatly increased force of men which was employed after the line was taken over in April, the numbers have been still further augmented, so that the re-laying of the whole 18 miles may be completed in 12 weeks from the present time. The joints of the rails and the fastenings of the chairs should, in the meantime, be very carefully attended to. Orders have wisely been given to slacken the speed of the trains pending the completion of this re-laying; and the posts have been erected, and wires strained, for providing telegraphic communication, which, strange to say, had not previously been supplied.

I have, &c.

H. W. TYLER,
Capt. R.E.

The Secretary
Board of Trade,
Whitehall.

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.

Board of Trade
(*Railway Department*),
Whitehall, 19th July 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London, Brighton, and South Coast Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the London Bridge station of the London, Brighton, and South Coast Railway, on the 22nd May last.

I am, &c.

W. D. FANE.

The Secretary of the
London, Brighton, and
South Coast Railway
Company.

Board of Trade
(*Railway Department*),
Whitehall, 16th July 1866.

SIR,

I HAVE the honour to state, for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 28th May, the result of my inquiry into the circumstances which attended a slight collision that occurred on the 22nd May, at the London Bridge station of the London, Brighton, and South Coast Railway, on which occasion about seven passengers were slightly injured.

It appears that as the 5h. 20m. p.m. train, consisting of an engine and 12 carriages, was leaving the eastern side of the Crystal Palace platform, about two minutes after the proper time of starting, it was at once followed by engine No. 180, (which had brought this train of carriages to this platform a little after 5h. p.m. from the Crystal Palace), in accordance with the usual practice at this station; but as soon as it began to move, the platform inspector, who had given the signal for the train to start, in the belief that all the passengers had got into the train, saw some passengers rush towards the last vehicle but one in the train, and he gave a signal to the driver to pull up, which was done, it is said, before the train had moved 20 yards. The driver of the engine No. 180, which was following the passenger train, did not observe the signal from the platform inspector for that train to pull up, and in consequence the following engine ran into the break van at the tail of the passenger train, and caused a slight shock, but nothing was knocked off the rails, and no damage was done to any of the rolling stock.

The platform inspector gave the signal for the passenger train to stop, as he was afraid that some of the passengers who were in the act of trying to get into the carriages after the train was in motion would be thrown under the wheels; but it seems that he did not take sufficient care in the first instance to ascertain that all the passengers had taken their seats; and knowing the practice adopted at the station of allowing an engine immediately to follow a departing train from this platform, he made a great mistake in signalling the driver of the passenger train to stop after he had once put him in motion. Several inspectors or ticket collectors were employed at this platform to assist in getting the passengers into the several carriages, and one of these inspectors informed me that three passengers were on the platform when the platform inspector gave the signal for the train to leave; two of these passengers got into the compartment of a first-class carriage (which already had its proper complement of passengers), as the train moved ahead, and they got out again when the train stopped; but the other remained on the platform. It is customary for these inspectors to signal to the platform inspector when all the passengers have entered the carriages, but this inspector had not given any signal on this occasion, and the train was started without it.

More care should be exercised by the platform inspector to ascertain that all the passengers are in the train, and when once started, with an engine immediately following it, the train should not be stopped.

The engine which followed the passenger train out from the east side of the Crystal Palace platform was going out, in order to get in front of another train of carriages which was then standing on the line on the western side of the Crystal Palace Platform, and which was to leave at 5h. 33m., and also to leave the eastern side clear for the next incoming train from the Crystal Palace, due at 5h. 23m., or about the time when the collision took place. The driver of No. 180 engine has been blamed for not keeping a better look out; but in my opinion it will be desirable to adopt the practice followed at some of the other metropolitan terminal stations, of keeping the following engine at the platform until a specific signal is given that the line is clear for it to leave, either to go to the coke shed, &c., or to get in front of some other train.

I am, &c.

W. YOLLAND,
Colonel.

The Secretary of the
Board of Trade,
Whitehall.

LONDON AND NORTH-WESTERN RAILWAY.

Board of Trade
(*Railway Department*),
Whitehall, 1st June, 1866.

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-western Railway Company, the enclosed copy of the report made by Capt. Rich, R.E., the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred at the Crewe Junction on the London and North-western Railway, on the 16th ultimo.

I am, &c.

W. D. FANE.

The Secretary of the
London and North-western
Railway Company.

Board of Trade
(*Railway Department*),
Whitehall, 30th May 1866.

SIR,

In compliance with your minute of the 18th inst., I have the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances connected with the collision that occurred on the 16th inst., on the Crewe and Shrewsbury Section of the London and North-western Railway.

The Crewe and Shrewsbury line joins the London and North-western main line to London, about half a mile to the south of Crewe station. The sidings and arrangements at Crewe are undergoing considerable alterations and additions, which are very much needed for the very large traffic at that station.

The North Staffordshire Railway joins the London and North-western main line to London, close to the

junction with the Crewe and Shrewsbury line, and the points and signals for the junction of both lines are worked from the same box.

On the 16th inst. a goods train from Manchester, which consisted of an engine and tender, 45 waggons, and a guard's van, pulled up at 11.30 a.m., at the sidings on the south side of Crewe station.

Thirty-six of the waggons were for the North Staffordshire Railway, and were after a delay of about 20 minutes taken on to that line. Seven salt trucks, two empties, and a guard's van, which were to be sent on to Yorkshire, were uncoupled and left on the main line, as the sidings were undergoing alterations and could not receive them. These nine trucks and the guard's van were pushed forward on to the Crewe and Shrewsbury line, first by a North Staffordshire engine, and a second time by a London and North-western goods' engine, that was taking some waggons on to the down sidings on the Shrewsbury line. To get to these down sidings it was necessary to push the salt waggons, which were on the up line, beyond the cross-over road to the down line, which cross-over road, is about 250 yards south of the junction box on the main line. The sidings at each side of the Crewe and Shrewsbury main lines, are protected by the man at the junction box on the main line at the north end, and by a signalman, stationed for the purpose in a box, at the south end.

The distance between these two signalmen's boxes is about half a mile, but the railway is on a considerable curve, and neither of these men have, therefore, a clear view along the line.

The signalman at the south end works an auxiliary signal, which is placed close to the junction box at the north end of the sidings, and the junction signalman at the north end works his junction signals subject to this auxiliary signal.

The salt trucks which were left standing on the up main line to Shrewsbury, could be seen by the man in the north junction box, but not by the man in the south junction box. It appears, however, that the man in the north junction box forgot that they were there, and did not carefully examine the Shrewsbury up line, before lowering his junction signals for the 12.30 passenger train from Crewe to Shrewsbury. He states, that before lowering his signal he looked round, and seeing that the auxiliary from the south box was lowered, he took down his junction signal, without observing the salt trucks on the main line.

Though he could have seen these if he had looked attentively, they do not appear to have been prominently in view, owing to the curve in the line, and the waggons that were standing in the sidings at each side of the line. The shunter, when he left the salt waggons there, did not notify it to the junction man, which he should have done, but it seems that he was not in the habit of doing so, under the belief that the junction man could see them himself. The fact is, the waggons were left on the Shrewsbury up main line for more than half an hour, and forgotten by the junction man and the shunter, who were both engaged with other matters during that time, and expected that they would have been taken away before the Shrewsbury passenger train passed. Both men, consequently, failed to take the necessary steps for their safety.

The 12.30 passenger train, consisting of an engine and tender, two composites, one 1st class, one 2nd class carriage, and a guard's van at the tail of the train, left Crewe for Shrewsbury at its proper time. The junction signals were lowered, and it ran past the junction at a speed of about 12 miles per hour. After passing the junction the fireman commenced firing, which he should have avoided doing till he was clear of the sidings, and the driver, who was evidently not keeping a good look out, failed to observe the waggons that were standing about 250 yards from the junction

on the same road that he was travelling on. He states that he observed the waggons when he was about 90 or 100 yards from them, but the fireman states that when the driver called to him to look out, that he dropped his shovel, stood to his break, and that the waggons were only about 40 yards from him. The driver states that he shut off steam, reversed his engine, and put on steam again, but that he had no time to sound his whistle for the guard's breaks, and the guard, who was sorting letters, knew nothing of the danger till the collision took place. It is, therefore, evident that the driver cannot have observed the waggons till he got close upon them. He states that he ran into the guard's van, at the tail of the salt waggons, at a speed of eight or nine miles per hour, which is probably about correct. The buffer beam of his engine and buffer castings were broken, and the smoke box slightly damaged. Only one of the carriages in the train was slightly damaged, and none of the vehicles of the passenger train left the rails.

The driver was shaken. The fireman jumped off, and the guard had his nose slightly cut. Three of the passengers are reported to have been slightly injured, but all of them continued their journey when the train was again started from Crewe at 1.26 p.m. on the same day.

The two hind wheels of the guard's van, attached to the salt waggons, were knocked off the road, but no injury appears to have been done to any of the vehicles of this train.

The cause of the accident was, leaving the trucks on the main line without making any provision for their protection. The shunter and the signalman at the junction, who were both responsible, forgot all about them, which is certain to be the case, where it is a practice to leave portions of trains standing on the main lines, for periods more or less prolonged, according as accident or work detains the engine and driver that are intended to return and take them away.

The extension of the station arrangements at Crewe will, I presume, prevent the necessity of thus leaving trains on the main line; the proposed raising of the junction box will give the signalman a better view of the lines, and the locking of the points and signals, which is also to be adopted, will afford very great additional security.

The driver of the passenger train to Shrewsbury stated, that the junction signals were not lowered for him till he got within 50 yards of the junction, and that he was running at a speed of 12 miles an hour at the time. He appears, according to the evidence of the fireman (who states that the junction signals were lowered while he was several hundred yards from the junction) to be mistaken as to when the junction signals were lowered, and I should hardly suppose that if a driver was rash enough to run within 50 yards of junction signals, which were against him, at such a speed, that he would confess to having done so; but the statement led to my examining the regulations in force on the London and North-western Railway, and it appears that those regulations authorize a driver to run close up to a junction signal which is against him, and do not provide for his remaining at a reasonably safe distance. This appears necessary in cases like Crewe, where there is no auxiliary signal from the junction on the Crewe side of the junction. As the points of the junction are frequently, as at Crewe, some little distance in front of the signals, a driver, who overran those points and caused an accident, would naturally plead his misjudgment of the distance, and shelter himself under those regulations, which admit of his running close up to the signals.

I have, &c.

*The Secretary of the
Board of Trade
(Railway Department),
Whitehall.*

F. H. RICH,
Capt. R.E.

LONDON AND NORTH-WESTERN RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 29th June 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be laid before the Directors of the London and North-western Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by their Lordships to inquire into the circumstances connected with the accident which occurred on the 21st ultimo to an excursion train near the entrance to the Watford tunnel, on the London and North-western Railway.

My Lords trust that the directors will give Colonel Yolland's report their most careful consideration.

I am, &c.

*The Secretary of the
London and North-western
Railway Company.*

W. D. FANE.

*Railway Department,
Board of Trade,
Whitehall, 25th June 1866.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 23rd ultimo, the result of my inquiry into the circumstances which attended the accident that occurred on the 21st ultimo to an excursion train, through coming in contact with the abutment of an over-bridge a short distance north of the north end of Watford tunnel, on the main line of the London and North-western Railway.

About 30 passengers are stated to be suffering from injuries received, and of this number, four received somewhat serious shocks to their systems, and upwards of 200 passengers have made claims for damages to clothing, detention, and alleged injuries, and have been settled with by the company for trifling amounts of compensation.

There are three lines of rails at this place, two used for up and one for all down trains, but the tunnel at Watford was not constructed wide enough for three lines of rails placed at the usual distance of six feet apart, and in consequence and to avoid facing points on the main line, the third line of rails, which is mostly used for goods and mineral traffic, is placed close alongside of the second or main up line of rails in the tunnel, and the proper width for three lines of rails is maintained to within a short distance of the two ends of the tunnel.

There is an over-bridge situated about 510 yards north of the north end of the Watford tunnel, and the third line of rails placed at a distance of six feet from the adjacent up line actually terminates in a blind siding at the north side of this bridge, the siding being entered by a pair of facing points, 70 yards north of the bridge; these facing points are set for a train to run into the blind siding instead of running out towards, and thus fouling, the second or main up line, in the event of an up train on the third line not stopping, as it should do, short of the facing points, until permission is given by the signalman to proceed. A fixed signal is placed close to the facing points, which always stands at danger. There is also a signal box close alongside of the down main line, opposite to these facing points, and the signalman works a distant signal for the third line, 740 yards north of the fixed signal, in addition to other signals for the other main lines. This distant signal is used in an exceptional manner, and is only placed at danger when there is another train on the third line between the distant and fixed signals, so that it does not tell a driver on the third line whether he is to be permitted to run out from the third line, and thus to foul the second or main up line, or to remain in the siding, unless it indicates that there is another train on the same line in front of him, between the distant and

fixed signals. The permission to proceed is given by a hand signal-flag by day, lamp by night. But it is distinctly understood by the servants of the railway company, that all trains on this third line are by the regulations directed to stop short of the fixed signal.

Unfortunately, like a great many other good regulations, this one is not always observed, and a practice had grown up of allowing trains to run out, towards the main up line, without having actually stopped.

On the 15th May, the superintendent of the south division of the London and North-western Railway, issued printed instructions with reference to the running of the Whitsuntide excursion trains, directed to commence on the 19th May, and among the number, up excursion trains were to be run on the 21st instant, from Northampton, Oxford, and Banbury to London. The Oxford and Banbury trains were directed to be united at Winslow, and the Northampton train to be united with the others at Bletchley.

The Northampton train, consisting of 18 vehicles and two guards' break vans with one guard, reached Bletchley station, according to the guard, at 8h. 42m. a.m. The Oxford and Banbury united train, consisting of about the same number of carriages, drawn by two engines, and with two guards and two break vans, reached Bletchley about 8h. 48m. or 8h. 50m. a.m., according to the guard of the Oxford train, and the driver of the Oxford train engine was then told to turn his engine, and attach on to the united train, in front of the Northampton train engine. Some of the carriages were so full when these trains reached Bletchley, that the station master had three more carriages added on to the united trains, which left Bletchley about 9h. 7m. a.m. It then consisted of two engines and 44 vehicles, including three break vans with three guards, one break next to the engine, a second, the 23rd from the engine, and the third at the rear of the train. This train, travelled on the main up line to Tring station, which was reached at 9h. 42m. a.m. Both engines took in water, and the train proceeded at 9h. 47m. a.m. along the third or up goods line.

It went on all right past King's Langley Station, 10 $\frac{1}{4}$ miles from Tring, and the driver of the leading engine says, that he there shut off the steam, and ran a short distance before putting on the tender break, and that they had reduced the speed to about 8 or 10 miles an hour when they reached the third line distant signal, when he felt confident they would be able to stop; that the tender break was eased off till they reached the beginning of the cutting, before coming in sight of the main signal for the third line (this is the fixed signal before referred to), and then the break was again put on. He then found very little diminution of the speed, and signalled to the guards, by sounding the whistle, to put their breaks on, but as the speed of the train did not diminish, he then reversed his engine, when about 30 yards from the facing points, and turned on the steam the reverse way, but he still found that the speed was not diminished as he expected, and they ran over the facing points along the blind siding until the train came in contact with the buffer stops and the abutment of the bridge. He says that he was perfectly aware that he ought to stop, but was under an impression that he was not assisted by the guards' breaks, and that he did not know what number of breaks were on the train. The fireman of this engine entirely supports the driver's statement. The driver of the second engine agrees with the driver of the first engine, as to shutting off the steam after passing King's Langley, and states that they applied the tender break directly after passing the third line distant signal (which was off) and as soon as they came in sight of the main third line signal, they whistled for the guards to put on their breaks, and finding that they did not put on their breaks, he reversed his engine and put on the steam the reverse

way. The fireman of this engine tells the same story, and adds that they reversed the engine and did all they could, but the weight of the train was so great, that they found there was not break power enough to stop it. The guard of the Banbury portion of the train, who rode in the van next the second engine, states, that the steam was shut off just before they got to the third line distant signal, and he then put his break on, and then the engine beat a little, as if steam had again been put on, after they had passed the distant signal, and he eased off his break a little; that he saw the red flag from the signal box, about 150 yards, or a little more, from the box, and he then put his break hard on, and kept it on, and it was on when the engine ran against the bridge.

The guard of the Oxford portion, riding in the middle of the train, says that he kept a look out the whole of the way, and that there was no alteration of the speed between Tring and King's Langley, and that they travelled at from 16 to 20 miles an hour. After passing King's Langley, he saw that the third line distant signal was off, and he put his break on as they were passing the signal, because he knew they were to stop, and kept it on (as that kind of break is apt to fly off, not being fastened by a strap) until the engine ran against the bridge.

The guard of the Northampton portion of the train says the steam was shut off on nearing the distant signal, when nearer to the distant signal than to King's Langley, and he then put on his break, and kept it on till the accident took place, and left it on when he ran back to stop the 7h. 30m. a.m. up Birmingham express passenger train.

The train after passing the facing points ran along the blind siding, carrying away the stops placed at the end of it, and the leading engine ran against the abutment of the over-bridge, and somewhat damaged the brickwork; its tender was crushed and twisted round, and separated from the engine; the next engine ran past the stops and fell over on its left side; the guard's van next this engine was greatly damaged, and it is very remarkable that the guard in it escaped without being injured; the two next carriages ran off the rails and were slightly damaged. The drivers and firemen all jumped off their engines before the accident occurred, and they state that they were not running more than five or six miles an hour at the time, but this rate is probably greatly under-estimated. The signalman on duty opposite to the facing points, leading out of the third line, states that the 7h. 30m. a.m. Birmingham up express train was telegraphed forward from Tring, as having passed at 9h. 57m. a.m., and in consequence it was due to pass his box at 10h. 11m. or 10h. 12m., and it was signalled forward by the train line telegraph from King's Langley, at 10h. 6m. or 10h. 7m., being late that morning. The excursion train was signalled forward in about 1 minute or 1½ minute after the other, and when the excursion train came in sight, the signalman says that he showed the driver a red flag to stop, and when he found that the drivers could not stop he put all his signals at danger, and blocked the line by telegraph to Kings Langley on one side, and Watford on the other. The excursion train passed his box at 10h. 10m. or 10h. 11m. I do not see that there are any grounds for blaming the signalman on this occasion. The arrangement is not a good one to have a fixed signal opposite to the facing points and a distant signal that shall not be placed at "danger" for the train to stop, except when there is actually a train between the distant and fixed signals. It is better, if possible, to avoid exceptional cases, and not to make regulations, such as that relating to the stoppage of every train on the third line, short of the facing points, which is certain to be

broken, and I therefore recommend that the signal and distant signal should be made use of to warn drivers at a distance that they are to run out from the third line, or to stop there, as the case may be. A change is also required with reference to the train line signalling. The "train on line" signal, should not be given on from one station to the next in advance when the line is clear, until the train is seen to be close on the station giving the signal. If the Birmingham up express train had not been signalled forward from King's Langley, before it was seen to be closely approaching that station, it is probable that the excursion train would have been allowed to proceed, and have got clear through the Watford tunnel before the other came up to the signal box.

The collision would not have happened, if the drivers of the engines of the excursion train had obeyed the company's regulations, and stopped short of the facing points; but it is very evident they expected to be allowed to run out toward the main up line, and were running very much faster than they admit, but not faster, probably, than their regulations authorized as their average speed south of Bletchley.

They complained of the guards not putting on their breaks, but the guards all assert that they did put them on, but not in obedience to any signal, as they heard no whistle sounded, and it is useless to expect that the whistle from an engine can be heard under all circumstances in the middle or tail end of a long train.

The drivers were much to blame for not having brought their train to a manageable rate of speed before they reached the distant signal, but they had a very heavy train behind them, and probably did not know from experience the difficulty which they would have in stopping it.

I think the company's management of the working of traffic is open to improvement. This is the largest and most important railway company in the United Kingdom, and it must necessarily employ a very large number of station masters. At present, these station masters have no instructions, printed or otherwise, limiting the number of vehicles that should be sent forward as a passenger train, and they are not told what number of guard's break vans and guards, or what proportion of breaks should be attached for the number of carriages, and they cannot all be expected to know what is deemed sufficient; so that, in this instance, an unwieldy and unmanageable train, consisting of two engines and 44 carriages, is sent forward from Bletchley, only provided with one break for every 14 carriages, in addition to the breaks on the two tenders. An excursion passenger train should not consist of more vehicles than the engine which draws it is fully capable of managing over the inclines on the road on which it has to travel, and in my opinion it is impossible to offer any excuse for sending out a train with such an insignificant proportion of break power, when three or four times that amount, might, by means of continuous breaks, have been attached to the train, without sending any additional guards. It is hopeless to expect any improvement in this respect, while such an example is set by the London and North-western Railway Company.

The officers of the company are somewhat disposed to blame the Bletchley station master, for not having sent the trains forward separately, as they arrived, but I must observe that he obeyed the printed instructions issued for his guidance, and might possibly have been blamed if he had acted differently in the event of a mishap occurring.

I have, &c.,
W. YOLLAND.
Colonel.

Board of Trade.*

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE AND LANCASHIRE AND
YORKSHIRE JOINT STATION AT STALEYBRIDGE.

*Board of Trade
(Railway Department),
Whitehall, 17 July 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade, to transmit to you, to be laid before the Directors of the Manchester, Sheffield, and Lincolnshire (Lancashire and Yorkshire,) Railway Company, the enclosed copy of the Report made by Colonel Yolland, the officer appointed by my Lords to inquire into the circumstances connected with the collision which occurred on the 13th ultimo, at the Victoria junction of the Manchester, Sheffield, and Lincolnshire, and Lancashire and Yorkshire Railways, at Staleybridge.

*The Secretary of the
Manchester, Sheffield,
and Lincolnshire
Railway Company.
The Secretary of the
Lancashire and Yorkshire
Railway Company.*

I am, &c.,
T. H. FARRER.

*Board of Trade,
(Railway Department),
Whitehall, 11th July 1866.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 20th ultimo, the result of my inquiry into the circumstances which attended the collision that occurred on the 13th ultimo at the Victoria junction, Staleybridge, between two passenger trains belonging to the Lancashire and Yorkshire and the Manchester, Sheffield, and Lincolnshire Railway Companies, when four passengers in the Lancashire and Yorkshire train, and one passenger in the Manchester, Sheffield, and Lincolnshire train, are reported to have been injured, one of the number severely.

The Staleybridge branches belonging to these two Railway Companies unite at the Victoria junction, situated about 150 yards west of the west end of the south platform of the Staleybridge station; and it appears, that as the 4 h. 35 m. p.m. up train of the Lancashire and Yorkshire Railway, consisting of an engine, break van, and three carriages, on its way to Manchester from Staleybridge, when travelling at from 8 to 10 miles an hour, was run into by the 4 h. 0 m. p.m. Manchester, Sheffield, and Lincolnshire train, proceeding in an opposite direction from Guide Bridge to Staleybridge, as it passed across the up line of the Manchester, Sheffield, and Lincolnshire branch line. The junction signals were all right for the Lancashire and Yorkshire train to proceed, and the driver of the Manchester, Sheffield, and Lincolnshire train admits that both the distant and junction signals were on at "danger" against him, and he states that he sounded the engine whistle in order to get them taken off; he thinks he passed the distant signal, which is 430 yards from the spot at which the collision took place, at the rate of about 15 miles an hour, while the guard of the train estimates the rate at from 25 to 30 miles an hour. The driver further states, that between the distant signal and the junction, he whistled for the guard's break to be applied, and adds, in which he is supported by other testimony, that he had almost brought his train to a

stand, when it fouled the other line and was struck by the Lancashire and Yorkshire Railway train.

One of the carriages in the last train was badly damaged, and two others slightly so, and the buffer plank and framing of the engine of the Manchester, Sheffield, and Lincolnshire train were broken. Nothing was thrown off the rails, and the passenger who was most seriously hurt, had his leg broken while riding in the second compartment of a third-class carriage in the Lancashire and Yorkshire train, by the body of the carriage being knocked in by the engine of the other train. The collision might have been avoided at the last moment, if the signalman had had the presence of mind to turn the Lancashire and Yorkshire train on to the Manchester, Sheffield, and Lincolnshire branch.

The Manchester, Sheffield, and Lincolnshire rules and regulations are quite explicit as to the driver's duty on such an occasion. Rule 26 page 14 says in the afterpart of the rule, "when a train approaches a station or junction and the distant signal shows 'danger,' it must come to a stand at the distant signal post, and then *immediately* draw slowly up to the station or junction, so as to be protected by 'the distant signal.'" The rule is unexceptionable; but unfortunately it is seldom or ever obeyed; and it is admitted that the practice on the line is for engine drivers not to stop at a distant signal, unless they see some obstruction on the line. They run past the distant signal, whistling for the signals to be taken off, and then, sometimes, when it is too late, endeavour to stop.

In this instance, there was no obstruction visible on the line between the distant signal and the junction, when the driver ran past it, and it was only as he came up to the crossing that the Lancashire and Yorkshire train passed outwards from Staleybridge station. The driver is described as being a very good driver, of 20 years' experience; but there is no doubt that he was alone responsible for causing this collision, by keeping on the steam too long, and running past the distant signal, instead of stopping at it and then drawing slowly up to the junction.

Railway Companies can never expect to be free from this class of collision, until they uphold the discipline on their lines. If they make rules and regulations, they should take the necessary measures for upholding these rules, so that it appears to me that the Company's management must be held responsible for the toleration of the practice to which I have referred.

I should add, with reference to the letter from the Mayor of Staleybridge, who reported this collision, (and not either of the Railway Companies as they are bound to do in compliance with the law,) that it cannot in any way be connected with the condition of the Staleybridge station, to which he has again called their Lordships' attention. I was informed that the engineers of these two lines had not yet had time to consider the question of what was best to be done at Staleybridge station, in consequence of the pressure of matters before the Parliamentary Committees.

*The Secretary of the
Board of Trade
(Railway Department).*

W. YOLLAND,
Colonel.

NORTH LONDON RAILWAY.

*Board of Trade
(Railway Department),
Whitehall, 5th June 1866.*

SIR,

I AM directed by the Lords of the Committee of Privy Council for Trade to transmit to you, to be

laid before the Directors of the North London Railway Company, the enclosed copy of the report made by Colonel Yolland, the officer appointed by their Lordships to inquire into the circumstances connected with the collision which occurred on the 19th ultimo,

at the Shoreditch Station on the North London Railway.

I am, &c.,
 W. D. FANE.
*The Secretary of the
 North London
 Railway Company.*

*Board of Trade,
 (Railway Department),
 Whitehall, 2nd June 1866.*

SIR,

I HAVE the honour to state for the information of the Lords of the Committee of Privy Council for Trade, in obedience to your minute of the 22nd ult., the result of my inquiry into the circumstances which attended a collision that occurred on the 19th ult., at the Shoreditch Station of the North London Railway, when the driver, Wm. John Ellis, of the engine of the leading train, was killed, and about 9 passengers were injured, none, it is hoped, very seriously.

There are three lines of railway at the Shoreditch Station, two up lines from Dalston Junction to Broad Street (City) Station, and one down line from Broad Street to Dalston Junction. No. 1 up line is used for all stopping trains, and No. 3, the second up line, for trains that do not stop at all the stations. No. 2 down line is used for all down trains. The station is protected by station signals, one arm for each line, situated at the north end of one of the station platforms, situated between No. 2 and 3 lines; and there are two distant signals for the two up lines situated about 450 yards north of the station signals. The other station platform is on the eastern side of No. 1 up line. As the station signals are at the north end of the station platforms, up trains, which have arrived alongside of the station platforms, have passed south beyond the control of station platforms; and, in consequence, two additional up signals have been placed at the south end of the station signals, which are called starting signals, and which are turned off by the signalman who is placed in a high box at the north end of the station platform as a signal for the train to start southwards for the city, as soon as he has been told by telegraph that the line is clear to Broad Street Station. The line is worked with the assistance of the electric telegraph, and on the block system, and there is a telegraph station about three quarters of a mile north of Shoreditch Station, called Dalston Bank, intermediate between Shoreditch and Dalston Junction.

On the evening of the 19th ult., the 7h. 0m. train from Fenchurch Street reached Shoreditch Station at 7h. 30m., or about 6 minutes late, on No. 1 up line. The up distant signal was all right for this train to go into the station, but there is some uncertainty whether the up station signal for this line was off or on as the train passed it. The evidence is contradictory on this point. It is, however, quite certain that the up starting signal was on at danger against this train when it arrived, and that it remained at danger until after the collision had taken place. The engine-driver, W. J. Ellis, got down off his engine for the purpose of oiling it, as he said he should not have much time after he reached Broad Street Station; and while he was thus engaged and standing in the space between the rails of No. 1 up line immediately in front of his engine, the 7h. 15m. p.m. up train from Chalk Farm Station arrived, and ran into the rear van of the Fenchurch Street train, which was pushed somewhere about 100 yards ahead; the driver was knocked down and his skull was fractured, it is supposed by the ashpan of the engine, and he was dead when he was taken up from between the rails.

I did not see the signalman, Richard Long, who was on duty in charge of the telegraphic instruments and out of door signals at Shoreditch Station. He is, I believe, to be tried for manslaughter on the coroner's inquisition, but from the admissions which he made before the coroner, and the evidence of the company's servants at Shoreditch Station, and those belonging

to the Chalk Farm up train, and to a down train that reached the station about the time when the collision took place, it appears that he had given the telegraphic signal "line clear" to Dalston Bank telegraph station some little time after the 7h. 0m. p.m. up Fenchurch train had reached Shoreditch Station, but he believes that he did not give "line clear" until he had taken off the up starting signal for No. 1 line as soon as he had been told from Broad Street that the line was clear to that station; and he says that he thought the Fenchurch Street train had left the station, as he heard the engine whistle before he gave the signal "line clear." The up distant and up station signals for No. 1 line were at "all right" for the up Chalk Farm train to enter the Shoreditch Station. The view, owing to a curve in the line and the parapet of an under bridge immediately north of the station, is very limited, and the consequences would in all probability have been very much more serious if the company's servants with the Chalk Farm train had not observed the driver of the down train making signals for them to stop, as they were passing over the bridge; and if that train had not had continuous breaks applied from the two ends of the trains, to ten out of the twelve vehicles of which it was composed, in addition to the break on the tank engine.

Some suspicion appears to have existed at the time that the signalman was not sober, but there is no sufficient evidence to prove that it was so; but the fact which seems to be established that he actually gave "line clear" to Dalston Bank immediately after the collision occurred, and while there were still two up trains at the Shoreditch Station, goes far to prove that he could not have known what he was about. A second collision was fortunately avoided, as another Fenchurch Street up train, which had in consequence been permitted to pass Dalston Bank, was cautioned by the driver of the down train, to which I have already referred, and this up train was pulled up before a collision actually took place with the Chalk Farm up train. The collision occurred about 7h. 36m. The guard of the 7h. 0m. p.m. up Fenchurch Street train was very much to blame that he did not go to the signalman to inquire how it was that his train was detained so long; if he had done this, it is quite possible that the collision might not have taken place.

At present, trains follow each other on this branch at about 7½ minutes interval of time, and I think it is to be regretted that this railway company have not established registers of the receipt and transmission of all telegraphic signals and of the arrival and departure of trains at all telegraph stations, as a comparison of such registers belonging to Broad Street, Shoreditch, and Dalston Bank, would, if they were properly kept, have been sufficient to prove what the Shoreditch signalman had been doing, especially as the keeping such registers makes the men more particular in the performance of their duty.

I understand that one objection entertained against keeping these registers is, that the officers of the company are afraid of giving the signalman too much to do; but these registers are partially kept at terminal stations and junctions, and if there were too much for the signalman to do unassisted, a lad might be employed to book the times, &c. In this way more hands would be trained and the station would not be left as Shoreditch Station was left after the collision took place without some one capable of working the telegraphic signals, independent of the signalman who is supposed to have occasioned it.

Again, if the starting signals at Shoreditch had been so locked that the signalman could not lower the up station signal for No. 1 line until the starting signal for the same line had been turned off, for the train standing alongside the platform to proceed to Broad Street this collision would not probably have occurred, although the signalman had, through mistake or negligence, given the "line clear" signal to Dalston Bank, after the 7h. 0m. p.m. train reached Shoreditch Station, as the station signal must have

remained at danger until the starting signal had been taken off.

The collisions due to mistakes on the part of signalmen in giving "line clear" when it is not clear are so frequent that I think it would be very desirable for the directors of the North London Railway Company to try the experiment of laying down a separate telegraphic wire, to be worked by the engine passing over and pressing down a treadle at the station in advance, and thus making the circuit complete, and causing a bell or gong to be sounded in the telegraphic signal box which the train has recently left, thus making every train telegraph back its own arrival at the next station in advance, in addition to the signalman's telegraph signal; and no train should be per-

mitted to leave a telegraphic station until both signals had been thus received, that would act as a check on the signalman.

In passing through Broad Street Station I could not avoid seeing that one of the down signals north of the platforms could not be seen by the driver of an out-going train, owing to the erection of a water tank after the station was opened for traffic. This signal should either be shifted or raised. There is no clock on the platform at Shoreditch.

I have, &c.

W. YOLLAND,
Colonel.

*Board of Trade,
29th May 1866.*

I HAVE the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, the result of my inquiry into the circumstances that led to the collision, that occurred in the Whitehaven Tunnel on the Whitehaven and Furness Junction Railway.

The tunnel is about three quarters of a mile long, and extends from Corkickle Station, which is at the south side of the town of Whitehaven, to Bransty Station, at the north side of the town. The line through the tunnel is a single line. It is worked by a pilot guard, with the aid of a single telegraph instrument, which denotes "line clear" and "line blocked," and a bell signal to call the signalman's attention.

The telegraph at Corkickle is placed in the station-master's office, which is also the passengers' booking office. It is worked by the station-master, who is also supplied with a talking instrument to telegraph messages to the station-master at Bransty.

The tunnel telegraph instrument at the Bransty or north end is placed in the signalman's hut, which is about 250 yards from the station, at the point where the lines leading into Bransty Station join the main line.

The pilot guard arranges the working of the tunnel, subject to the regulations laid down by the company. He has a pilot engine under his control. The practice has been, that the pilot guard gives a hand signal to the drivers, when they can start, to run through the tunnel. The departure of such train is not telegraphed to the other end of the tunnel, but no second train is allowed to follow till a telegram from the other end announces that the first train has got clear through the tunnel. The pilotman starts all the trains that require to go through the tunnel, and accompanies the last.

No train is allowed to leave either end unless the pilotman is present at that end. The men that work the telegraph at each end of the tunnel, enter the hour at which they receive and send the telegrams.

Each end of the tunnel is also provided with a signal, to denote that the pilot guard is present at that end, when the signal is down, and absent when it is at danger.

The above system is open to the following objection, that the signalman at the end of the tunnel whence the train proceeds may not notice that a train has started, or may forget that it has been started if the acknowledgment of its passing at the other end is delayed, and the consequence would be that he might start a second.

To obviate this, the company have issued an order that the pilot guard shall see himself the notification on the telegraph instrument of the line being clear; but I conceive that this regulation is very liable to be neglected, as it divides the responsibility, and only gives the pilot guard the onerous duty of being a looker on. The collision on the 10th instant was owing to his neglecting this duty.

It appears, however, that the pilot guard necessarily became an active sharer in the telegraph duties at the south end of the tunnel. The station-master comes on duty at 5.30 a.m. daily; he remains till 7 p.m., three days in the week, and till 9, 10, 11, or 12 o'clock at night, according as the trains come in, on the other days of the week. The only porter belonging to the station is almost wholly taken up with working points to the goods yard, consequently the station-master has to issue tickets, attend to all passenger trains, and do all the duties connected with the station, in addition to telegraphing all the trains. He is absent at his dinner for about 40 minutes during the day, and during such time, and when late of a morning, the pilot guard worked the telegraph till very lately, when some slight disagreement seems to have taken place, and the pilot man refused to do it.

At 9 a.m. on the 10th instant, the pilot guard despatched a mineral train, which consisted of an engine and tender, 20 coal waggons, 9 trucks loaded with iron ore, and a guard's van at the tail of the train, from Corkickle Station, to proceed through the tunnel to Bransty.

One of the couplings in the train broke, and three waggons, with the guard's van, were left about 120 yards from the mouth of the tunnel at the Bransty end. The pilot man and station-master at Corkickle had returned to the office after despatching this mineral train. A passenger train, consisting of a tank engine, a guard's van, a second class, a first class, a third class, and a composite carriage, coupled in the order stated, arrived at Corkickle about 10 minutes past 9 a.m. The telegram, that the mineral train had got clear through the tunnel, had not been re-

ceived from the telegraph signalman at the Bransty end of the tunnel. Both the station-master and the pilot guard came out of the office to attend to the passenger train. The station-master was in the act of descending from the roofs of the carriages after putting in the lamps when the pilot man signalled to the driver of the passenger train to start away through the tunnel.

The pilot man remained at Corkickle, intending to proceed through the tunnel with the 9.30 a.m. passenger train. He returned into the station-master's office, and as he entered, asked the latter whether he had received "line clear" for the 9 a.m. mineral train. The station-master replied "No," but the passenger train had already started and entered the tunnel. It ran into the guard's van, which was the hindermost of the vehicles that had broken away from the mineral train, at a speed of about 14 miles per hour. The van and one of the mineral waggons were smashed to pieces, and knocked off the road, and two other waggons were damaged. As there was no light on the van at the tail of the mineral train, the driver of the passenger train had no notice of his danger. He was knocked down and slightly hurt in the knees and face. The fireman was not injured, the guard was only slightly hurt, but several passengers were injured, four of them rather seriously.

The end framing of the passenger engine was broken, and the chimney was damaged. The carriages were very slightly injured, and none of the

vehicles in the passenger train were knocked off the road.

The accident was caused by the pilot guard neglecting to obey his instructions, which directed him to witness the receipt of the telegram that the line was clear, before he despatched a second train.

The pilot guard has been a long time in the company's service, and bears an excellent character.

It appears to me hardly desirable that he should be a looker-on at the telegraphing.

It divides the responsibility with the person entrusted with the the telegraph.

I would recommend that either the pilot guard be entrusted solely with this duty in a separate office, or that a clerk be specially appointed for the purpose, and that the departure of the trains shall be registered, as well as the telegrams announcing that they have got clear through the tunnel, otherwise confusion between the trains that have been despatched, and those that have cleared the tunnel is liable. I recommend that the station-master, or some other person, be deputed to raise the pilot guard's signal when he leaves the station, as it ensures the station people being aware of his absence, and the pilot guard himself must be apt to forget it in the hurry of departure.

I have, &c.

F. H. RICH,
Capt. R. E.

*The Secretary of the
(Railway Department),
Board of Trade.*

W. D. FANE.

(643 R.)

Captain *Tyler*, R. E., to the Secretary, Railway Department, Board of Trade.

Sir,

Chesham, 8 March 1866.

I HAVE the honour to report, for the information of the Lords of the Committee of Privy Council for Trade, that in compliance with the instructions contained in your minute of the 2d instant, I have inspected the Tame Valley Viaduct on the Midland Railway, with reference to Sir Robert Peel's letter of the 27th ultimo.

This viaduct, a short distance to the south of the Midland Railway Station at Tamworth, is about 230 yards long and 30 feet high. It consists of 19 openings, one of 60 feet, and 18 of 30 feet each; it carries a double line of rails, and it is constructed with masonry piers and abutments, and brick arches with stone quoins. The River Tame, a public road, and a turnpike road, all pass under it. It has been in use for 27 years, and the Company are unable to produce the plans and sections from which it was built.

I learn that the fourth pier from the north end began to fail 18 years ago, and I find that it has now sunk vertically to the extent of $4\frac{3}{4}$ inches on the east, and $5\frac{1}{2}$ inches on the west side of the viaduct, besides being three inches out of the perpendicular, in consequence of the foundation having moved southward. The Company inserted four horizontal struts six months since, between this pier and that on the south of it, and they commenced at the same time to construct centering for the support of three of the arches, two on the north, and one on the south of this defective pier, with a view to its reconstruction.

The remainder of the viaduct appears to have been substantially constructed, but it is evident that the foundations of this particular pier could not have been taken down to solid ground or otherwise rendered secure. And it is most desirable, with a view to the safety of the whole viaduct, that this pier and the defective arches on either side of it should be rebuilt on a better foundation, with as little delay as possible. Great care will be necessary during the progress of the work, and I recommend as additional precautions, that the horizontal struts which have been inserted between the fourth and fifth piers be braced in the meantime both vertically and laterally, as well as that similar struts be inserted between the fifth and six piers, to prevent the possibility of any injurious effect from horizontal pressure upon the fifth pier; and that centering and props be supplied for a fourth arch, so as to provide that two arches be supported on each side of the defective pier.

I have, &c.

(signed) *H. W. Tyler*,
Captain Royal Engineers.

The Secretary,
Railway Department,
Board of Trade.

RAILWAY REFORM (IRELAND).

RETURN to an Order of the Honourable The House of Commons,
dated 11 May 1866;—for,

COPY “of a MEMORIAL to the Chancellor of the Exchequer, signed by the Lord Mayor of *Dublin* on behalf of a PUBLIC MEETING held in that City on the 2nd day of February, on the Subject of RAILWAY REFORM.”

TO THE RIGHT HONOURABLE
WILLIAM EWART GLADSTONE, M.P., ONE OF THE LORDS COMMISSIONERS
OF HER MAJESTY'S TREASURY.

The respectful Memorial of the Irish Public, arising from the Proceedings of an aggregate Meeting convened by the Right Honourable the Lord Mayor, pursuant to a Requisition presented to his Lordship emanated from every Province in Ireland, and representing every Class and Interest in the Country as being unanimously in favour of Irish Railway Reform,—

Showeth,

THAT, previous to the meeting above referred to, several of your Memorialists, upon the issuing of the Royal Commission on Railways in April last, deemed it desirable to organise public meetings in Dublin to elicit the feeling of the country as to the necessity of Irish Railway Reform, and which meeting was held on the 1st of June last, when the following resolutions were passed unanimously.

IRISH RAILWAY REFORM MOVEMENT.

At a highly important and influential meeting held by requisition at the Mansion House, Dublin, on Thursday, 1st of June instant, in order to aid the Royal Commission now sitting in London, and receiving evidence in regard to the charges, rates, and management of Irish Railway Companies, and to adopt such measures as may be deemed advisable for carrying out the principles of the Railway Act of 1844 (7 & 8 Vict. c. 85), now about to come into operation, in such manner as the state of Ireland so urgently demands,—

The Right Honourable the Lord Mayor in the Chair :

1st. That it is the opinion of this meeting that no measure would be better calculated to develop the resources of Ireland and improve the social condition of the Irish people than one whereby the present fares and railway charges would be reduced to a low and uniform rate, and unity of action be effectually established ; provided, however, that any arrangement of the kind shall provide ample protection for the property of railway proprietors.

2d. That the General Railway Act of 1844 (7 & 8 Vict. c. 85), by which the Government is enabled, on certain terms and conditions, to deal with or purchase all railways thereafter to be constructed, presents one method of carrying out the above object.

3d. That the increased traffic which would be created by a uniform system of low rates, together with the considerable reduction of charges which would be effected by a less oppressive rate of interest on railway

debt, and by a consolidation of railway management, would, in the opinion of this meeting, more than compensate for any temporary loss arising from reduced rates.

4th. That Her Majesty's Government having appointed a Royal Commission to institute inquiries with reference to the railway system of Ireland, it behoves the public to afford the Commission every possible assistance and information.

5th. That the chairman, the secretaries, the movers and seconders of resolutions, together with such other gentlemen as they may invite to join them, be appointed a committee to carry out the object of this meeting.

That Memorialists, acting upon the foregoing resolutions, formed a committee, with the then Lord Mayor as chairman, aided by many of the most influential citizens, and having instituted inquiries from the various Chambers of Commerce and bodies throughout Ireland, as suggested by the Circular issued by the Royal Commissioners, inviting evidence upon the rates, charges, and management of the Railways in Great Britain and Ireland, obtained replies from all the leading commercial communities and others, furnishing the most ample proof that the present system of charges and management of the Irish Railways was not adapted to the commerce of the country, or calculated to promote its growth and development.

That the committee appointed by Memorialists accordingly, at some expense and considerable labour and time, collected the aforesaid evidence, and delegated several members of the Irish Railway Reform Committee to present themselves for examination of and in support of said evidence before the Royal Commission on Railways then sitting, who were pleased to approve of their being examined. Their testimony will be found in the papers relating to Railways in Ireland, and styled "The Evidence and Papers relating to Railways in Ireland," January 1866, just published by authority of the Royal Commissioners, to which Memorialists most respectfully refer your Lordship.

That Memorialists, for the purpose of again bringing before the country what had been done by the committee of your Memorialists, and feeling assured that a reference to the whole of the evidence given before the Commission, and now in print, had proved the case for railway reform in Ireland, did not hesitate, in compliance with a requisition of great influence and weight, to call another aggregate meeting, which was held in the great room of the Mansion House on the second day of the present month (February 1866), the Right honourable the Lord Mayor presiding.

A copy of said requisition and report of the meeting Memorialists have the honour to respectfully submit herewith.

That meeting was not only numerously attended, but may be said to have largely represented the land, commerce, and general industry of the country.

The resolutions then adopted are herewith submitted to your Lordship's favourable consideration, under the conviction that the time has arrived when, owing to the exceptional condition of Ireland, a compliance with the prayer of your Memorialists would confer upon her the greatest boon she has in modern times received at the hands of the British Government.

"Resolutions," 2d February 1866.

IRISH RAILWAY REFORM.

At the aggregate meeting held this day in the Round Room of the Mansion House, convened by the Right Honourable the Lord Mayor, pursuant to public requisition, and which was numerously attended, the following Resolutions were passed unanimously:—

Resolved,—That in the opinion of this meeting, the evidence on Irish Railways taken by the Royal Commissioners, and just published by the Government, fully

fully proves the necessity of a thorough reform of the management and a reduction of the rates of the Irish Railways, for the interest of the shareholders as well as the public.

Resolved,—That the financial position of the Irish Railways is such that the Directors cannot be expected to carry out the necessary reduction of fares and charges advocated by this meeting on their own responsibility; and as the Royal Commissioners have not reported specially on the Irish system, and as a considerable time must elapse before the publication of their general Report for the United Kingdom, we respectfully call upon the Government to take the evidence on Irish Railways as published into their immediate consideration, with the view of bringing forward a measure this Session of Parliament, whereby the principles of the Railway Act of 1844 (7 & 8 Vict. c. 85), may be applied to the whole group of railways in Ireland.

Resolved,—That while we desire to leave the Government and the Legislature perfectly free to determine in what way the principles of the Railway Act of 1844 may be applied to the Irish Railways, this meeting is of opinion that no measure of railway reform would be complete which did not provide for a substantial reduction of fares, and uniformity of management, upon the whole Irish system.

Resolved,—That in the opinion of this meeting, whatever plan may be adopted by the Legislature for Railway Reform, it should effectually secure the property of existing proprietors and vested interests of every kind.

Resolved,—That considering the great benefit which all classes in this country would derive from uniformity of management and cheap fares and rates, it is the opinion of the meeting that if the Government bring forward such a measure for the reform and management of Irish railways as would meet the wants of the Irish people, whatever temporary loss the change might involve should be made up by relieving railroads from local taxation, and by a special provision applicable to this country to supply the deficiency.

Resolved,—That a memorial embodying the principles of the foregoing resolutions be drawn up, and presented to the Government; and that we call upon all classes throughout the country generally to co-operate with us to petition Parliament on the subject; and that the Right Honourable the Lord Mayor, as Chairman of this meeting, be requested to sign its memorial.

Resolved,—That the resolutions adopted at this meeting, and the requisition convening it, be forwarded to the Royal Commission on Railways, with a request that they will take into their consideration the propositions therein contained.

Resolved,—That the thanks of this meeting are due and are hereby given to the members of the Irish Railway Reform Committee for their exertions in bringing the question of Railway Reform before the country, and especially to such of them as at great inconvenience and expense attended before the Royal Commission and gave valuable evidence, as may be seen in the Blue Book just published, and that they be requested to continue their labours for carrying out the objects set forth in the foregoing resolutions, and be instructed to obtain as far as possible the co-operation of the Peers and Irish Members of Parliament for that purpose.

Resolved,—That a subscription be now entered into to defray the expenses incurred by this movement and placed to the credit of our treasurers.

Resolved,—That the special thanks of the meeting are presented to the Irish press, and particularly the Dublin journals, for the liberal and efficient aid they have afforded the cause of Railway Reform, and that they be requested to continue it as essential to the good of the movement.

Resolved,—That the Lord Mayor do leave the chair, and that John Barrington, Esq., T.C.D.L., be called thereto.

Resolved,—That the cordial thanks of this meeting be given to the Right Honourable the Lord Mayor for the assistance he has given the movement, and for the prompt manner in which he complied with the wish of the requisitionists,

tionists, and for having granted the use of the Mansion House, as well as for the urbanity and efficiency with which he presided over this great and important meeting.

Resolved,—That the secretary, Mr. R. Jackson, is entitled to the thanks of the meeting for his zealous attention, and for the assistance he has rendered the movement.

Memorialists earnestly pray that the principles of the Railway Act, 1844 (7 & 8 Vict. c. 85), may be applied to the whole group of Irish railways, or such revised form of said Act as the Government and Legislature may be pleased to consider most suitable, upon a review of their present position and prospects, it being on the grounds of pressing necessity for prompt and separate legislation that the Memorialists venture to humbly and urgently solicit your Lordship to anticipate the Report on the Railways of the United Kingdom, as the Irish section forms a distinct and altogether separate case, warranting your Lordship in recommending the prayer of Memorialists, that the great financial burdens by which many of the Irish Railway Companies are overborne may be removed, an equitable adjustment of rates and charges be effected, an uniform and economical management be secured, and scope be thus given for a complete utilization of the system, adapted to the means and necessities of the country, thereby conferring an Imperial measure of immense national benefit, and giving an impetus to many branches of manufacture and enterprise now either dormant or struggling, and providing a channel for directing the minds of the industrious classes to the exertions now making to improve their condition.

That Memorialists venture to (in confirmation of their statement as to the depressed financial condition of the Irish lines) refer to the Memorial lately presented to your Lordship by several of the Irish Railways admitting their prostrate position, and asking for financial relief, offering in lieu to submit to any revision of rates and management that your Lordship might see fit to introduce. The statements of said Memorialists supplies your Lordship with sufficient data, and precludes the necessity of now entering upon a financial statement in reference to these companies; but Memorialists strictly adhere to the principle set forth in Resolution No. 3, annexed hereto, in reference to said companies.

That Memorialists respectfully beg leave to submit for your Lordship's information the following comparative results of the separate revenues derived from the railways of the United Kingdom, as contained from the returns of the Board of Trade for the year 1864 :—

	Miles open.	Gross Revenue per Annum.	Per Mile.
		£.	£.
England - - -	8,890	28,667,664	3,229
Scotland - - -	2,105	3,776,309	1,789
Ireland - - -	1,794	1,581,606	882

From which it will be seen that the Irish lines are in mileage proportion greatly below their proper ratio, and that in a great measure the discrepancy may be attributable to the comparatively higher rates for passengers and merchandise on Irish lines, as can be seen on page 368 of the Blue Book issued January 1866, containing the statistical evidence and papers on Irish lines. And your memorialists are of opinion that if a suitable reduction of the fares and rates be carried out, the result would ultimately be an increase of revenue, accompanied by great corresponding advantages to the trading community and the middle and lower classes, who are now prohibited from using the railways in consequence of the present high charges and limited management.

That Memorialists, in conclusion, beg leave to state that the capital embarked on Irish lines amounts to nearly 25 millions, one half of which is issued at preference rates of interest or dividends, the average rate payable being 5 per cent. per annum, which is found to be oppressive, and to meet which exorbitant rates and charges are framed, and which leaves a portion of the remaining half only an average of about 3 per cent. per annum; but in many instances

instances no dividend or interest is received by the original shareholders. Memorialists' main object is to obtain financial relief for the railways in Ireland, whereby an uniform rate of dividend and uniform rates and charges may be effected by a Government measure; that the whole system shall be placed under an improved management and a permanent and satisfactory basis, for the good of the entire kingdom.

May it therefore please your Lordship to bring forward the prayer of your Memorialists for the immediate consideration of the Commissioners, and induce them to adopt such legislative measures for the improvement and relief of Irish railways as to your wisdom may seem meet, and as their present state so urgently demands. And your Petitioners will ever pray.

Signed on behalf of said Memorialists and by their request,

(signed) *James W. Mackey*, Lord Mayor,
Chairman.

GEORGE WARD HUNT.

COPY of TREASURY MINUTE, dated 24 May 1866.

EARL RUSSELL and the Chancellor of the Exchequer state to the Board that they have received a deputation, consisting of Lord Clanricarde, Lord Devon, Mr. Malcolmson, and other gentlemen largely interested in Irish Railways.

The deputation represented, that in consequence of the present monetary derangement, not only is it impossible for the Irish Railway Companies generally to obtain money for the works in progress on reasonable terms, but that many of those Companies are now called upon to repay, at short notice, large sums advanced on mortgage or other security for the prosecution of these works; and that great embarrassment and wide-spread distress in Ireland will follow, unless the Companies thus circumstanced should receive some assistance from Her Majesty's Government.

It would appear from the statements made by the deputation, that debentures to the extent of, at least, 500,000 *l.*, are coming due within the next twelve months, and that other advances have likewise been made, in many cases, to Boards of Directors on their personal security, which it is likely, to a large extent, will be immediately called in.

Lord Russell and Mr. Gladstone state, that in their opinion it would be difficult to adopt any scheme of a permanent nature affecting railways in Ireland until the Royal Commission on Railways shall have made its report. But that this objection would not apply with equal force to temporary measures which might be taken in view, especially of the present derangement of the money market; and they propose that some assurance should be given to the Companies referred to of the willingness of Her Majesty's Government to assist within certain limits, and through the agency of the Public Works Loan Commissioners, in meeting the demands of the holders of railway debentures or other securities which may be about to fall due, under the circumstances stated.

They recommend, accordingly, that the Public Works Loan Commissioners should be authorised to advance, during the next three months, on the security of debentures already issued, and being overdue or falling due during that period, sums not exceeding in the whole 500,000 *l.* for one year, at a rate of interest not being less than 4 per cent., with the distinct understanding, however, that the Public Works Loan Commissioners, in accepting these debentures, shall be satisfied as to the sufficiency of the security offered.

Before the expiration of the three months, it will be open for consideration whether circumstances may render any further extension of the period advisable.

Lord Russell and Mr. Gladstone add, that if it should be found necessary to obtain the sanction of Parliament for such a relaxation as regards the purposes for which the Public Works Loan Commissioners are empowered to make advances, as this measure may require, they recommend that a Bill for the purpose should be forthwith prepared, and submitted to Parliament. My Lords fully concur and are pleased to adopt the recommendations of the First Lord and the Chancellor of the Exchequer. Their Lordships, however, desire that it may be clearly understood that they reserve to themselves a full discretion as to the terms upon which the loans are to be made; but that in no case are they to be under 4 per cent., and that the object of the concession under the extraordinary circumstances of the present emergency is to enable railway companies in Ireland to re-issue debentures, which were originally issued at par, to parties having *bond fide* invested their money in those securities.

Let a copy of this Minute be sent to the Public Works Loan Commissioners for their information and guidance, and state that if the Commissioners will consent to undertake the further and important functions which on the present temporary emergency will devolve upon them under this Minute; and if, in their opinion, it will be necessary to obtain additional powers from Parliament, my Lords request that they will instruct their solicitor to prepare a Bill, to be submitted to Parliament, with as little delay as possible; and in such Bill it appears to my Lords that the following points should be provided for:—

1. That the rate of interest should be at the discretion of this Board, but not less than 4 per cent.

My Lords are disposed to think that the interest to be charged for money advanced to take up any existing debentures should be, under ordinary circumstances, at the same rate as that to which the debentures so taken up, or assigned were liable, otherwise it might become the object of each company to endeavour to transfer all their debenture debts to the Government.

2. The Bill should provide for overdue debentures as well as debentures falling due within the next three months.

It would seem desirable that an expeditious and cheap means of recovering should be provided in the event of the Companies being unable to redeem the debentures transferred to Government at the expiration of the period, by which, without prejudice to other creditors, the costs of proceedings might be saved.

COPY OF TREASURY MINUTE, dated 15 June 1866.

THE Financial Secretary states to the Board that he had received a deputation this day, consisting of Lord Clanricarde, Lord Devon, Mr. Malcolmson, and other gentlemen interested in Irish railways, with reference to the Treasury Minute of 24 May.

Different members of the deputation, in the course of their discussion, urged upon the consideration of Her Majesty's Government the following points as alterations in, or additions to, the conditions under which the loans were to be made to railway companies in Ireland, as set forth in the Minute referred to:—

1. That the power to the Public Works Loan Commissioners to lend should be extended to any legal securities within the borrowing powers of each railway company, whether the full amount of borrowing power may have been already exercised or not.

2. That the power of lending should be continued by the Act for a period of three years, so as to enable any debenture falling due during that time to be taken up.

3. That the securities upon which the Public Works Loan Commissioners are to be empowered to make loans should not be limited to debentures, or such other securities as are, strictly speaking, issued in accordance with Acts of Parliament, as provided in the Minute of 24 May, but should include directors' acceptances.

4. That

4. That the borrowing and lending power with reference to each company should extend to the entire capital, so as to enable the Public Works Loan Commissioners to take preference or other shares as security for loans.

5. That the interest to be charged by the Public Works Loan Commissioners should not necessarily be at the same rate as that payable in respect of the securities to be paid off by the loans.

Mr. Childers states that he is unable to recommend the concessions involved in the 1st, 3d, and 4th propositions.

As regards the 2d, he observes that it seems unnecessary ; should circumstances hereafter require an extension of the period during which the lending and borrowing powers are to be exercised, it would seem the more proper course to seek from Parliament in a future Session an extension of the powers.

And as regards the 5th proposition, he suggests to the Board that it might be desirable to reserve to this Board the power, under special circumstances, to reduce the rate of interest below that paid in respect of the securities paid off ; but in such cases the Minute should be submitted to Parliament.

My Lords concur and are pleased to direct that a communication be addressed to Lord Clanricarde, that my Lords are unable to entertain the 1st, 2d, 3d, and 4th propositions ; but that they have given instructions to have the Bill modified, so as to admit of the rate of interest being reduced, under special circumstances, below the rate previously paid.

Transmit a copy of this Minute to the Public Works Loan Commissioners.

ANALYSIS OF EVIDENCE.

ALLPORT, JAMES, ESQ. (*Analysis of his Evidence.*)

Is general manager of the Midland Railway Company; 5261. Has only temporary arrangements for through booking for tourists and goods to a limited extent. Has found that agreements between Irish and other English companies have materially interfered with through booking of Irish railways. Through booking traffic is embraced by arrangements with Ulster Company; they have also made similar arrangements with other English companies; 5265-5267, 5269. Midland Company have attempted to make arrangements with other companies, but have failed. If better arrangements could be made between English and Irish companies a large amount of traffic could be developed which does not now exist. Irish railways ought to be thrown open to every English company who can book through by a reasonable route. Free trade principle adopted upon Midland Railway is best for the companies and the public; 5268-5271. Is not generally in favour of compulsory powers for booking through, but thinks that if English companies make an arrangement with one Irish company they should be compelled to make arrangements with others having reasonable routes; 5272, 5273. Attempted some years since to book through to Belfast and South of Ireland, but difficulties were raised by the boards and it was given up; 5274, 5275. Is aware that Irish railway companies are now applying to the Government for further assistance; if given, it should be upon condition that the whole of Irish railways are thrown open to English system; 5276-5280. Inconvenience arises from country being split up into such small divisions. Amalgamation would be as advantageous to Irish railway system as it has been to the English. Sufficient scope in Ireland for two or three systems of railways, but all should be compelled to work in harmony with each other. Is not in favour of Government supervision, even in the particular case of Ireland, as it is not equal to private management. It would not be necessary to have a supervising power to prevent unfair competition, as that might be left to arbitration; several cases in England where standing arbitrators are appointed. The proper way to regulate companies would be to lay down certain rules, and add an arbitration clause, which clause should be extended to the public. Would be a good system to extend to English companies if they called upon Government to assist them; 5281-5290. Is aware that it has been recommended that Government should purchase Irish railways; objects if management in the hands of Government. If difficulties in the way of leasing overcome, and a lease were to be granted to a small number of individuals, management of railways could not be superior to present management. Reasons why witness thinks Government management inferior to that of body of directors; discussion thereupon. If Government granted a lease and allowed proprietors to appoint their officers, it would be merely transferring the railways over to the Government for the Government to transfer them back again to a company; 5291-5305. Present management of railways in Ireland generally speaking satisfactory to the public; they are tolerably well managed. Thinks they have done all that can be reasonably expected of them towards developing resources of the country. Is not aware that any of them have been managed with a view to favour steam ship companies rather than the shareholders; there has been a tendency to make exclusive arrangements with one or two English companies; 5306-5308. Midland system has connexion with South of Ireland by way of Bristol. Has exchange traffic with steamboat companies trading to that port, but no through booking arrangements with any other Irish company through Bristol; 5309, 5310. Has no coal traffic arrangements with any Irish company. Coal traffic in Ireland could be much developed if companies adopted same free-trade policy which has guided Midland affairs; increase of this traffic in the last 17 years. Send no coals to Ireland. Mileage rate to London varies according to distance and circumstances; states *modus operandi*. Highest rate does not exceed $1\frac{1}{2}d.$ per ton per mile, lowest about $\frac{3}{4}d.$ Rates do not include use of waggons or terminal charges; terminal charges in the country

ALLPORT, JAMES, ESQ.—*cont.*

and in London. Same rate for large as for small quantities; 5311-5324, 5336, 5337. If a fair mileage rate were established, believes Yorkshire coal could be delivered in Dublin for 12s. 6d. or 13s. per ton. If coals were conveyed across the Channel to Ireland by screw steamers as they are between the North and London, with same rate for long distances as Midland, the whole of Ireland could be freely supplied with English coal. Is aware that there is no communication in Dublin between railways and the wharves. Cartage makes a considerable additional charge. Assuming that railway charged $\frac{1}{2}d.$ per ton per mile, there is no reason why coal should not be sold at stations on extreme west coast of Ireland for about 16s. or 17s. per ton. Obstacles that prevent attempts being made. Boards and managers of two or three large companies in England think that no company could carry at the rate of $\frac{1}{2}d.$ per ton per mile; 5325-5334. Has always found temporary loss has followed reduction of rates, but generally there has been a gain in the end; 5335. Reductions on Midland Railway have been made from time to time; occasionally even now they reduce the present low rate; 5338. No reason why experiments in reduction of rates would be attended with more difficulty or greater risk in Ireland than in England; it should be done with care; would be attended with loss, but increase of traffic would ultimately make it up; in agricultural districts it takes much longer time to make up loss than in manufacturing districts, more especially where the population is comparatively poor. A reduction is frequently made in one district, and not in another. Mentions three instances upon the Midland; 5340-5342. Would not reduce third-class fares from 1d. to $\frac{3}{4}d.$ at once, but gradually until seen how far reduction may be carried with profit; 5343. It is possible that from Bristol to Lancaster (extreme length of railway) a third-class passenger could not go and return same day; such a state of things as that a third-class passenger upon any part of Southern and Western railway could not go to and from Ennis same day should not exist, as it tends to check traffic. Midland issue third-class day tickets at a reduction of 25 per cent. from double fares; these are much taken between country places and market towns; would be to interest of railway companies in Ireland to do the same. Has been for some years trying to get the same system adopted from all places in England to all places in Scotland, but has not yet succeeded; 5344-5356. Has tried to establish a low scale of third-class fares in purely agricultural districts. Result of an experiment made to abolish second-class carriages and only have first and third, and how long it took to recover itself; 5358-5374. If Irish railways were purchased by Government and leased to a company, they would be willing to wait with greater patience for result of experiment than could be expected from present boards of directors, though that would depend very much upon the terms of the lease; 5370-5374.

BAGOT, MR. JOHN. (*Analysis of his Evidence.*)

Is a merchant in Dublin; 6992. Great complaints from merchants of inequalities in the charges, and also of the through rates being most injurious to Dublin trade; how they affect commercial travellers and customers from country towns. Mentions a case where great inconvenience was occasioned from insufficiency of third-class trains from Dublin to Tralee. Goods can be delivered in Carlow *via* Dublin from Liverpool nearly as cheap as from Dublin to Carlow, in consequence Carlow customers are driven from Dublin to Liverpool. Specifies particular charges upon certain articles. Formerly certain goods were delivered from Dublin to Bagenalstown for 7s., but in consequence of arbitrary classification are now charged 8s. 6d. to 18s. 6d. Company refuses to supply classification lists, and Great Southern and Western and Midland Great Western do not keep tariff of prices; 6993-6999. Difference in the rates for corn, seed corn, and seed, leads to people marking goods improperly. Difference in rates for ginger cordial and ginger wine, although both same value. Inequalities in

BAGOT, MR. JOHN.—*cont.*

the rates for small parcels, and method adopted in order to make parcels up to luggage weight, and thereby save expense. Can get no explanation of these inequalities in Ireland. Would like to see penny postage system carried out for parcels, that is, same rate for any distance, or might be divided into 50 or 100 miles. Same charge on same railway for a hamper of soda-water for 25 as for 51 miles; 7000-7011. 7018, 7019. Has heard that railway companies give preferential rates; this may be the reason why they will not give tariff of prices. Should not be allowed. Complains also of the break in railways. Inconvenience felt from this cause by a person wishing to go to Derry. In consequence of high rates contract tickets are seldom issued; 7012-7017. In some cases parcels rates have doubled on Dublin and Kingstown railway; not many goods sent; line too short. Carry market parcels and market baskets free. Four-horse coach running by side of railway, which carries cheaper than the railway; 7020-7025. General good that would arise from serious reduction in rates would completely outbalance any small evil that might be done in other respects. Would like people to be able to carry their fish to all parts of the country inland. Gives rates for herrings from Arklow to Dublin; high rates do not prevent them being eaten by the people there. Difference in charge might be appreciable in consumption. Reason why generally obliged to pay half the carriage of goods to most of the customers; 7026-7031. Can send goods to Cork cheaper than to such places as Templemore and Mallow; also sends goods to Londonderry by way of Liverpool cheaper than direct from Dublin. Gives difference and insurance by water; 7031-7039. Would propose as a remedy to present state of things that Government should take possession or control of railways, so that people should be able to travel for $\frac{1}{2}$ d. per mile third class; thinks it would pay; 7040, 7041. Customers would transact their business in person instead of by correspondence if they could travel cheaply. Mentions a case of store cattle being driven 60 or 70 miles in consequence of the high rates; would have cost double if sent by railway. Thinks a less reduction than 50 per cent. would induce them to be sent by railway. Fat cattle are also sent by road for a shorter distance; 7042-7048. Is not prepared to enter more fully in detail into nature of great movement that should be made for reduction of rates; differs *in toto* from gentlemen connected with railways who say that if a penny is taken off it cannot be made up; 7049.

BARRINGTON, JOHN, Esq. (*Analysis of his Evidence.*)

Is Lord Mayor of Dublin; as such presided at meeting held to consider subject of Irish railways. Has heard much about the subject, and has a general knowledge of the position of the country with regard to it; 7104, 7105. Some alteration required in system, but very hard to suggest a remedy. Result of meeting was the receipt of 18 letters, consisting mostly of complaints of what are considered excessive charges, and how they militate against shopkeepers in the country, by parties living in the neighbourhood round these country towns finding it more advantageous to go and buy direct in Dublin. Reasons which may induce them to go there; 7106, 7107. 7124-7130. Not sufficient inducement to labouring classes to travel. Fares are too high. Experiment tried last week or two on Midland Great Western line of running an excursion train at single fares for third-class passengers; the receipts increased 1,000%. It was the artisan class who chiefly made use of these trains; 7108-7110. Railway companies have objected to carrying people at low fares, thinking the better classes would avail themselves of them, and not travel first or second class; does not think they would. No reason why the rich should not enjoy low fares. Midland Great Western has got into different hands, who are trying a reduction of fares. Great Southern and Western lines are running excursion trains at a single fare for the Exhibition. Has been informed that they rather lost by it; 7111-7120. No difficulty in organizing excursion trains in Ireland for want of facilities for amusement and entertainment of the people. At Killarney, hotels, &c. are very good; not so good at Connemara, but no difficulty in getting anything to eat there. Hands in a letter headed "Irish Railway Reform Movement. Statement as submitted by the Right Hon. the Lord Mayor of Dublin to the Royal Commissioners on Railways, showing causes of complaint on Irish lines;" 7121-7123. Is a soap manufacturer in Dublin; sends products all over the country. Has been put to disadvantage in consequence of different rates charged between Liverpool or other towns in England and towns in Ireland, as com-

BARRINGTON, JOHN, Esq.—*cont.*

pared with the rates between different towns in Ireland. Has been obliged to ship goods over to Liverpool to be taken to Sligo. Cheaper to send them by that route; now sends them by railway, and allows customer 10s. per ton; nearly half the profit. Does not know cost by either route. Goods going from Liverpool to Sligo go round the coast; go same way to Ballina. Natural difficulty of sea conveyance being cheaper than land conveyance might be got over by reducing land carriage; 7131-7137. If rates were lower would send an increased quantity of soap to Sligo and be able to compete with Liverpool men. Cannot send it from Dublin there by sea. Reduction would bring trade direct to Dublin; would be profitable to railway companies. Has repeatedly written to directors of Great Southern and Western Line as to a lower tariff from Dublin to Cork, but they will not consent to it. If rates were reduced one half could supply Cork market with soap. Hands in table, sent by Alderman Mackie, showing through rates from different towns in England to different towns in Ireland, the various relations of one to another, and how they affect his trade. Return defective in not giving charges from Dublin to certain towns in Ireland; 7138-7147. 7278, 7279. Thinks that if Commission were to suggest that a committee should sit in Dublin and go through country and see real position of railways some good might result from it. Long discussion as to whether fuller information could be obtained by so doing, and in the event of this being granted, whether people in England might not desire same thing; and also as to whether more information could be acquired by a committee in Dublin as to feeling in regard to proposed new tax; 7148-7161. 7257-7277. In case of some railways it would be very beneficial if Government interfered; might buy up some, or lend them money at a low rate of interest. General feeling that railway directors are not liberal enough with the public. Difference of opinion prevails as to whether Government should interfere. Mentions Mr. Galt's views, and states that there are many who think that Government, by purchasing railways at a certain rent, might benefit the people by reducing the fares, and that loss, if any, might be met by imposing an income tax for Ireland of 1d. in the pound. Has not ascertained the opinions of others, but thinks that plan would be generally acceptable. Would not mind an additional 1d. in the pound, benefit to the country should be looked to. Owners of landed property would not like it, but from increased prosperity of the country they might get higher rents, and there would probably be a demand for building ground. Believes that after a time traffic would so increase that there would be no necessity for the tax. Is of opinion that the whole community would receive a benefit from such a scheme; 7162-7178. 7198-7202. What addition it would be necessary to make to a certain resolution (handed to witness) before it would be carried at a public meeting in Dublin. Whole country has been benefited by construction of railways; benefits would be extended by a large reduction in the rates; 7179-7184. Discussion as to whether landowners whose land is held on long leases, owners of property held on perpetuity leases, and absentees, would receive a benefit equal in value to amount they would have to pay in income tax; 7185-7202. If Government once took up the railways, they could not go back to old system; would have to make new lines. Saving that would be effected in management. If a large reduction were made gain to the public would be a great deal more than the loss; 7203, 7204. If old lines did not pay with reduced rates, new lines would increase loss; 7204-7207. An extension of railways in a district already supplied might improve it even still more, and much more than amount of tax they would have to pay. Could not be extended without consent of Parliament. If Government did not think it would pay, they would not make line. No railway should be constructed with the intent of making it remunerative by imposing high rates, but inhabitants should wait until country sufficiently populated to make it remunerative. Parliament might take a case of this kind into their consideration; 7208-7216. Rates by Bianconi's cars. If Government were to take possession of all existing railways, it would be necessary for completion of scheme that all future ones should come into their hands. Parliament might either prevent new railways being made, or give authority to private speculators to make them upon condition that after a certain time they should be handed over to Government. Reads a letter from Mr. Goodbody, a large miller at Clara in the centre of Ireland, who states that if coal could be carried for $\frac{1}{2}$ d. per ton per mile, it would come into more general use and be a fruitful source of revenue. Many who get

BARRINGTON, JOHN, ESQ.—cont.

their living by making and saving turf and selling it in the towns would obtain employment in other ways; some might suffer. Objection made to the introduction of coal; same was made to introduction of machinery; 7217-7228. Getting coal into interior of the country, and making it available for working machinery, would provide a much more profitable employment than cutting turf; number of population that used to cut turf diminishing. From Clara it is 80 miles to nearest port; does not know charge for coal by railway; Mr. Goodbody states it is 1*d.* a ton per mile. If there should be a large demand at the port, price would slightly increase; would soon equalize itself. A reduction of one-half upon this distance would make a difference in the price of coal to extent of 3*s.* 4*d.* per ton; reduction would be about 25 per cent. on present prices. It would probably bring coal into use in places in the neighbourhood of which turf is obtained. Facilities for unloading coal in port of Dublin defective; movement in Dublin to empty the ships by machinery will make the price uniform throughout the year. Is aware that in most parts of England the railway comes down to the landing place, and that coal is unshipped at about 2*d.* or 3*d.* a ton. In Dublin it costs 3*s.* 6*d.* An Act has been passed this session to lay down tramways along the quays; will make coal cheaper in Dublin, and people in interior will also get it; would be a great inducement to a poor man to use coal if he could get it for 2*s.* or 3*s.* a ton cheaper; 7229-7249. Discussion as to whether people at such places as Clara are not in a better position for obtaining coal than people in south of England; 7250-7254. If Government took railways, and average loss for first two or three years was a million per annum, but afterwards from increased traffic there was no loss at all, people of Ireland would not wish for a further reduction; 7255. Is not aware that rates for third-class passengers in India average $\frac{1}{8}$ ths of a penny per mile; 7256. Reads two letters, one complaining of railway charges for conveying cattle and sheep, and their result; and the other of railway arrangements in connexion with Wicklow Copper Mining Company. Hands in a letter received from one of the directors of this company giving a full account of the different rates charged. Refers to district between Dublin and Bray and Kingstown, which shows that low fares encourage the people to go about. Scarcely fair to compare this district with others, it being a pleasure district; 7280, 7281.

BEWLAY, MR. THOMAS. (Analysis of his Evidence.)

Is a merchant in Dublin; 6901. Arrangements made by English companies for transmission of goods by Irish railways detrimental to mercantile interests of Dublin, and invariably made for interests of English lines, and not with regard to Irish traffic. Gives three illustrations showing difference in rates charged from Liverpool and from Glasgow to certain places *via* Dublin, and to same places from Dublin; reason why difference made. If Midland railway can afford to carry at low rates through Dublin, they ought to carry at lower rates from Dublin, and not charge more. Does not know freight from Liverpool to Westport. Must allow steamboats something to induce them to take the goods. Is rather a benefit to people at places where difference made. Would have Midland reduce rates, raising them would send traffic by sea; 6902-6918. Is not aware that in many cases Irish railway companies charge Great Western and London and North-western companies a local rate upon Irish portion of line; 6919. Mentions inequalities in the rates charged for manufactured and pig lead (the ores being obtained from Wicklow mountains) sent from Dublin to Belfast and from Dublin to Newry; 6920-6923. Important to commerce of Ireland that there should be a considerable reduction in rates. Reduction would not materially increase produce of ores. How and in what quantities ores are sent to Newry; 6924-6929. Should be a reduction in rates charged for coal into interior of the country. Turf has become a costly article of fuel. Would be a great boon to peasantry if coal could be carried for $\frac{1}{4}$ *d.* per ton per mile, and consumption would greatly increase. At what price obtained from Kingstown, and cost when brought to smelting works; might be delivered at any railway station into interior for about same rate. Means of unloading and placing on the railway should be much cheapened; for 50 or 60 miles would have same effect as reducing rates one-half. Has an agreement with Great Southern and Western Company to carry anthracite coal for 1*d.* per ton for any distance exceeding 30 miles. This coal is not used at smelting works, but principally for lime-burning. Price at pit's mouth, and at a distance of 30 or 40 miles. Distance of mine from railway, and cost of cartage. Not sufficient traffic to

BEWLAY, MR. THOMAS—cont.

warrant a branch railway being made. Consumption not large, and if it were to go to any considerable distance would come into competition with Welsh anthracite coal, which is landed at all the ports from Waterford to Cork at about 7*s.* per ton. Is not suited for domestic purposes. Gives imports of coal into Dublin for 1850-1852 and 1860-1862. Is certain that a large portion of coal goes into the interior of the country. Is carried for 1*d.* per ton per mile. If rate were reduced to $\frac{1}{2}$ *d.* per ton, quantity carried would be enormously increased; 6930-6951. Has heard that present charges on merchandise repress and prevent traffic being carried on, comparing value or market price of goods, at one place and another. If a very large reduction took place, in a very short time increase of traffic would bring up income to an amount greater than at present. A reduction of 75 or 80 per cent. would be sufficient. Would like to see deficiency made up by Legislature guaranteeing something like present rates. Would prefer that deficiency should come out of general funds of United Kingdom, but would be willing to make a special tax for Ireland. If England and Scotland were taxed, would be ultimately benefited in a far greater proportion. Reason why experiment should be tried in Ireland. Gives number of first and second-class passengers carried by five daily trains on Great Southern and Western for the half year, and number of third-class passengers carried by three daily trains on same railway and for same period. If experiment tried as suggested and increase of traffic did not make up for reduction, there would be heavy pressure put upon State to continue low rates. Does not imagine such a contingency would arise; illustrates matter by mentioning number of passengers carried from Cork to Macroom by two opposition cars; gives fares, and states traffic remunerative. Cars very general over south and western parts of Ireland, and as far north as Sligo. Mr. Bianconi ran them until driven off the road by railways. Thinks railway not yet opened from Macroom; 6952-6972. High rates in some districts due to lines having been made in unremunerative districts. Roman Catholic places of worship erected at Dublin and elsewhere by the pennies of the poor and not from legacies or donations; furnishes an analogy to what might be expected on railways were rates low enough to enable the poor to use them; 6973, 6974. May be some who travel third class in Ireland who in England would travel second, but thinks generally people like to associate with their own class; 6975. Reason for reducing first-class fares. Very little pleasure traffic in Ireland. Companies occasionally run excursion trains; should have them every day in the year; 6976-6978. Gives an instance of persons travelling by omnibus and by steamer in consequence of railway being dearer; 6979-6981. Knows instances of cattle being driven along the road, and mentions case of a gentleman driving 65 miles in consequence of the high rates; 6982-6986. Relates a curious circumstance showing disadvantage under which peasantry in Killybegs labour from not being able to bring produce to market; would be a great advantage to have cheap lines of railway carried to such places. Would impress upon Commission that there should be a very large reduction, believing that the greater the reduction the greater will be the success; illustrates this by the penny newspaper and postage stamp, and from the 6,000,000*l.* derived from tobacco, being principally consumed by the lower classes, comparatively little being derived from cigars; wishes to show that income is derivable from the million, and that they are the true source of income. Would not give an opinion as to whether, if tobacco duty were reduced one half, revenue would be the same; 6987-6991.

BIDDER, GEORGE PARKER, ESQ. (Analysis of his Evidence.)

Is a civil engineer and director of the Great Eastern Railway; 4213, 4214. Has been often consulted by railway companies both upon financial and engineering questions. Has paid attention to position of Irish railways generally; 4215, 4216. Whole of railways in Ireland should be amalgamated and placed under one management; 4217, 4218. Suggests a scheme of which the first step would be to obtain an Act of Parliament authorizing Government to buy up all the railways; management of them should then be placed in the hands of a limited company, by having a contract let to them, subject to conditions that there should be facilities given to the public, and low rates for coal, cattle, dairy produce, &c. Explains particularly the scheme; states rates that should be charged, and how the three descriptions of stock should be dealt with. Long discussion thereupon; 4219-4231. 4246-4254.

BIDDER, GEORGE PARKER, Esq.—*cont.*

4259-4271. 4280-4282. 4322-4328. 4356, 4357. 4367-4372. 4393-4400. 4404-4439. 4450, 4451. 4462, 4463. Reduction of rates will stimulate industry of any country; 4232. Thinks there would be a large passenger traffic in Ireland; one train a day at $\frac{1}{4}$ d. per mile would pay this company. It is only by applying a low rate continuously that extent of traffic can be ascertained; 4233, 4234. A large amount of traffic can be carried in a purely agricultural district; cites the Great Eastern; 4235. If rates for coal in Ireland were same as by the Great Eastern there would be a great increase in traffic; the coal owners finding the waggons, the terminal charge being $\frac{1}{2}$ d. The rate from Peterborough, 100 miles, is 108 farthings. If Irish cottagers could get coal they would use it. Consumption both for manufacturing and domestic purposes would increase. Thinks it could be delivered at stations in central parts of Ireland for $\frac{3}{4}$ d. and $\frac{1}{2}$ d. for terminals; price at Dublin quays. Unless under 20s. the Irish poor would not use it; 4236-4245. 4364-4366. 4440, 4441. Is of opinion that Government would receive offers from proposed company, as undertaking would be profitable. Terms of lease might be considered every 10 or 14 years, and readjusted upon net revenue of railway at that period; how to meet objection that by such plan it would not be for the interests of the lessees to stimulate traffic beyond a certain point; 4255-4274. How extensions of railways in Ireland should be dealt with under scheme. Discussion thereupon; 4256-4258, 4319, 4358-4362. If Government bought the railways they would have to pay more than market value; 4272-4274. There might be loss for a year or two if scheme carried out; but saving in management, greater economy in working, better use of rolling stock, and stimulus given to traffic by reduction of rates, would ultimately relieve the State from loss; 4275-4277, 4293, 4294. Has no doubt that the terms offered to State would cover interest of debt; 4278, 4279. Reasons why his scheme preferable to plan either of allowing existing companies to borrow money upon the security of the State at a reduced rate of interest to pay off their debentures, or having compulsory amalgamation between leading companies. If companies were divided into two systems, it would be an improvement upon present system; 4233, 4234. Would object to laying any charge upon the State in order to benefit Ireland. State can confer a benefit upon companies by borrowing at a low rate of interest and accommodating them with capital so obtained. If Government had supplied debentures at $4\frac{1}{2}$ per cent. they could have raised the money for 3s, thereby making considerable profit; 4285-4291. The answer that the contract has been made for a certain number of years would relieve the Government from any pressure put upon them to get new companies to work at unremunerative prices; 4292. All the large English companies have consolidated themselves into great systems without State interference, but many years must elapse before the same rule would work in Ireland; thinks State might step in and hasten operations; 4295-4299. Advantage of concentrating all the railway companies into one would be felt in England as well as in Ireland. Does not think amalgamation in England yet complete; 4300, 4301. In some respects everything said as to Irish railways is applicable to English. Great convenience to several English railway companies if Government would take the debentures; 4202. Scheme applicable only to Ireland. In England could only deal with preference capital and not interfere with management; 4303-4305. Irish railways in same condition as English when Manchester and Liverpool and London and Birmingham were separate lines. Market value of shares would be likely to rise if there were an expectation of scheme being adopted. Value should be taken at announcement of scheme; 4308-4310. If railway traffic increased between first proposal of scheme and adoption, dissatisfaction would be felt by shareholders, but any terms would be an advance of present value; 4311. Any company prepared with requisite capital and security should be allowed to compete for lease of Irish railways. The most eligible terms should be accepted. It might be necessary to appoint a board to receive and judge of tenders. Should not be an Irish board, though Irishmen might be members; 4312-4317. If scheme carried out there would be many dissatisfied, having lost their influence; 4318. Thinks that localities not now served by railways would have no difficulty in getting power to make them, provided they had a legitimate *locus standi*; 4320, 4321. Mineral traffic in Ireland ought to be quadrupled; if rates were reduced one-half the traffic should be doubled; wherever low rates are intro-

BIDDER, GEORGE PARKER, Esq.—*cont.*

duced a fresh source of traffic springs up; 4330-4332. Whether traffic be at low or high rates it is made up by quantity, and comes to this, that the normal earnings of a railway are 5s. a train mile, and normal expenses 2s. 6d.; 4330-4333. If coal were carried for $\frac{1}{2}$ d. instead of for $\frac{3}{4}$ d. as at present, it would not require three times existing traffic to make up for reduction, as goods trains would then be filled; 4334. Increase on English railways and also on continental lines mainly due to their long leads; would be modified when lead only 60 miles, though partly met by terminal charge being the same for 50 as for 60 miles; 4335, 4336. How demurrage upon a waggon is regulated; by consolidating systems it is got rid of; 4337, 4338. Cannot have so long a through rate between any two points of a country which is narrow. When lead is short reduction in charge for conveyance of certain articles depends upon reduction of rate; in coal, if rates were reduced from 1d. to $\frac{1}{2}$ d. in a lead of 50 miles, the saving would be 2s. 6d. per ton; 4339-4341. If passenger fares were reduced to $\frac{1}{4}$ d. a mile the requisite increase would be obtained from more people travelling, and by trains taking goods from station to station on their way; 4342, 4343. Working expenses of Irish railways as compared with Great Eastern are nearly the same per-centage; the former gets an advantage in wages, and from not having to pay Government duty. Chief difference in miscellaneous charges. Charge for permanent way in Ireland not yet up to its full amount; 4344, 4345. 4374-4377. Not acquainted with Great Western amalgamation basis; previously there was as great a division of railway interests in Wales as in Ireland; basis upon which they are being combined; 4346-4352. Difficulty in dealing with amalgamation of railways in Ireland upon same basis; 4353. Amalgamation in England has greatly tended to a gradual reduction of the rates; 4355. Explains the case of the London and North-western Company, giving rates for coal that would not admit of witness sending them to London; 4363. A large saving would be effected by consolidation of Irish railways; 4373. Thinks rolling stock of Irish railways sufficient; 4378. Discussion as to expediency of carrying coal at $\frac{1}{2}$ d. per ton per mile. Gives gradients on certain lines; 4379-4390. It is possible that a company might be found to buy up whole of railways in Ireland, but thinks scheme suggested would be preferable. Companies could not borrow on such easy terms as Government; 4401-4413. In order to develop traffic unequal mileage rates must be adopted; 4442, 4443. States amount set apart for permanent way, engine power, and carriages and waggons, and gives duration of rails and sleepers; 4444-4449. Under proposed plan there would be an inducement to increase traffic. No company would lease railways unless they expected a greatly increased traffic; 4452, 4453. Irish gauge would be no obstacle to working witness's proposal; 4454-4458. The London and North-western and Great Western Companies might be represented in leasing companies. English companies would not get possession of Irish railways to work them to the detriment of all other companies without the sanction of Parliament. They would view it as a mercantile speculation; 4459-4461. Thinks through traffic would be better developed if lease were in the hands of London and North-western Company than in the hands of a mercantile company; 4464, 4465. Cannot state saving in management since Great Eastern amalgamated; 4466, 4467. Reasons why railways should not be in the hands of parties connected with the district; 4469. Local traffic of Great Eastern has been much developed since amalgamation; 4470-4472.

BOILEAU, MR. JOHN GEORGE. (*Analysis of his Evidence.*)

Is a wheat merchant of Dublin; 6802. Has for a considerable time directed his attention to system pursued upon Irish railways. Is of opinion that the proper development of the commerce of the country can only be effected by cheap rates both for passengers and goods. Trade in white paint seriously inconvenienced by Great Southern and Western line charging 20s. per ton, whereas it can be brought by steamer from Liverpool and Bristol for 10s. Present through-rate system organized by London and North-western line, and co-operated with by Irish railways, has proved most detrimental to traders of Dublin; gives an instance. A person leaving Dublin for Belfast will have to travel over three or four different lines whose interest should be identical, but whose operations are antagonistic, and consequently traffic in every way suffers. States that the express train from Dublin arrives in Belfast just one hour too late to catch steamer which sails each evening for Scotland. This accounts for letters taking nearly two days to go from Dublin to Scotland.

BOILEAU, MR. JOHN GEORGE—cont.

How delay may be obviated. Dublin trader suffers from carriage to such towns as Armagh, Enniskillen, &c., being so high that the shopkeepers there cannot come to Dublin, but are confined to Belfast. Great complaints of the high rates charged by Midland Great Western Company. Dublin merchants in sending goods to west of Ireland very frequently ship them by steamer to Liverpool, and thence by steamer to Sligo and Westport, and save considerably by so doing. Dublin and Kingstown Railway have reduced fares, owing to opposition caused by river steamers and by omnibus. Frequent changing of time-table on the Dublin and Wicklow line has been loudly complained of. Has frequently to make a reduction off the carriage paid, or correspondent would transfer his dealings elsewhere. If traders could get their goods as cheap from Dublin as from English outports, much of their business would be sent to Dublin. In consequence of expensive mode of conducting railways, directors cannot venture such experiment as reduction of rates. Has prepared tabular statement, showing charges on articles in large daily consumption. Gives evidence obtained from firm of Alexanders and Co., wholesale druggists, who complain of the high rates charged for goods and small parcels. Inconvenient arrangements made by Midland Great Western line for goods traffic; quotes rates paid for parcels; 6803-6805. If Midland line reduced fares from Dublin to Galway (126 miles) one-third, poor people who now walk would be induced to use the railway. Thinks such reduction would pay the company; 6806-6811, 6816. This railway company have made a special rate for harvest men; but they only did so when they were compelled; 6812-6815.

BRADY, MR. THOMAS F. (*Analysis of his Evidence.*)

Is secretary to Special Commission on Irish Fisheries, and late inspector of fisheries in Ireland; 3182, 3183. Is acquainted with state of all the Irish fisheries. Describes the best coasts for sea fisheries, and enumerates their products; 3184-3186. Since 1844 population employed in fisheries decreased; 3187, 3188. Extension of Irish railways has not led to any increase in produce of fisheries; facilities of transit are insufficient; 3189, 3190. Before extension of railways chief market for fish taken on west coast was in the interior, but now it is sent to Dublin, and from thence to all the principal towns in England. In seaport towns there is a falling off in the demand for fish. Supply in Dublin unequal to demand; 3191-3194, 3275. High rates tend to depress the trade. Better facilities for getting fish away since introduction of railways. States cause of decrease in the trade; 3195-3200. Jolters or hawkers buy the fish at the boats and send it to Dublin. Price of fish risen in consequence of great demand for English market; gives route by which it is sent, and price at the market, and also price paid by hawkers to fishermen. If greater facilities were afforded, fishermen could send their fish direct to factor in Dublin; 3201-3223, 3231, 3232, 3245, 3246, 3248-3257. Quotes rates for fish by certain railways. Midland Railway charge unequal rates in proportion to mileage. Complaints made of inequality, but there has been no alteration. Discussion as to how far a reduction of rates would affect the price of fish. Reasons why fishermen do not send their own fish to market, and thus do away with the middlemen's profit; 3224-3230, 3233-3244, 3247, 3263, 3266-3269. Great many middlemen make large profits. There are no markets where fish is caught, it is sold on the strand in bulk. In some cases there is competition; 3258-3262. Custom of this class of people to sell goods to agents; 3264, 3265. If the fish is spoilt on the journey, profit of middlemen considerably reduced; 3269-3271, 3310-3314. Railways have not benefited the fisheries to the extent contemplated; 3263, 3274. Except at Galway the fisheries on the west coast have not suffered from a trades-union system. A fishing company was established there, and was well supported by the fishermen, but it failed from mismanagement, and not from any obstructions by the people or the railway company; 3276-3282, 3284. Want of private enterprise is the root of much of the evil existing in Ireland; 3283. Railway company at Galway afford every facility; quantity of fish carried by that line in 1852, and where collected; 3285-3291. Reduction of rates would increase quantity sent from Sligo and Ballina, as it has to be carted 16 or 18 miles. Salmon sent from Ballina round north coast by smacks at much less expense than by railway; 3292-3296, 3298-3301. Interviews between Irish Fishery Commissioners and directors of Irish railways; 3297, 3330-3332. No uncertainty in the fishing trade. Galway train starts at 12 o'clock at night, and the boats are all in before that

BRADY, MR. THOMAS F.—cont.

time. A similar train from Sligo or Castlebar would be of great advantage. In some places coarse fish are packed in ice. In such case a few hours' delay is not of much consequence; 3301-3305. Large take of fish at Kinsale last year. There is a good supply in Dublin Bay, but these are not affected by railway carriage. City of Dublin badly supplied with fish, as it is sent off to English market. Reads extracts from Reports of Commissioners, in which they state that moderate rates, especially for small parcels, and quick transit, would benefit the fish trade in certain districts, but that in 1855 the rates were increased from Cork and Dublin. Discussion upon this increase; 3305-3310, 3315-3329. Encouragement to fishermen on western coast, if a reduction were made in freight, and facilities of transit increased. The Great Southern and Western line make up a train when they have large packages of fish. Witness would have trucks attached to ordinary trains to carry the fish. There are no special trains for fish. It is a long time reaching the market, being generally sent by goods train at inconvenient hours. Fish caught at Castlebar on Monday does not get into Dublin market till Wednesday morning, there being no mail train; 3333-3343. General complaints made of want of accommodation on the Great Southern and Western line; 3344-3346. Insufficiency can hardly be attributed to fact, that being a poor country with limited traffic, companies cannot afford to run cheap trains. How requirements of Castlereagh district could be met. Reason why there is no night train from Castlebar to Castlereagh; 3350-3356. Difficulties in getting from place to place by trains not running in connexion with one another. This would be remedied if there were not so many opposing interests; 3357, 3358. Third-class accommodation very bad in Ireland. In consequence of the delay it costs a passenger in the end more to travel third-class to the Dublin markets than if he had gone first-class; 3359-3362.

CAWKWELL, WILLIAM, Esq. (*Analysis of his Evidence.*)

Is general manager of the London and North-western Railway; 5053. Acquainted with Irish railways generally, especially those in connexion with and going through Dublin. Has connexions through Fleetwood and Belfast with northern railways of Ireland; 5054. Had through booking for passengers between principal stations on North-western and Great Southern and Western lines; tried to get it for goods, but only partially succeeded. Have had great difficulties in bringing through booking into operation even with Great Southern and Western. States system of through booking for goods, and arrangements made with that company; 5055-5059, 5079, 5081-5085. Scarcely any through booking from Cork *via* Dublin in consequence of a differential rate of 20 per cent., which throws traffic upon the water. None from Greenore. An Act has been obtained for a railway from Dundalk to Greenore, and for the construction of a port at Greenore. Arrangements the London and North-western Company have made for the traffic; discussion thereupon; 5060-5064, 5090-5095. Between Dublin and Limerick Junction the rates by railway or by sea route are the same. Gets a larger proportion of the traffic between Limerick Junction and Dublin, but does not get heavier traffic between Limerick and Waterford and down to Cork; 5065-5068. Is of opinion that railway traffic of Ireland has not yet been half developed. Steam packet interest in the way of trade being effectually developed; 5069-5072. Irish boards so mixed up with steam packet companies that railway companies do not get the advantages they should. In all divisions of traffic Irish companies have their local rates out first, and other companies have to sacrifice a portion of their receipts on the English side. Irish rates not lower than those of the London and North-western; 5073, 5074. How through booking rates divided; 5075, 5076. English rates for cattle in many cases lower than Irish; 5077. Some of the Irish railways managed with a view to profit steam packet companies rather than railways. Discussion as to liability to sea risk; 5078-5080, 5156, 5157, 5250-5260. When a board interested in steam packets the traffic rates will be fixed to favour their port; 5087, 5088. London and North-western have expended money in Dublin to secure a position upon the Liffey when traffic can be shipped and carried by steamer to Holyhead; has not spent money in Greenore; 5088-5095. Has never seen a letter (*handed in*) from Mr. Stephen Brown addressed to chairman of London and North-western Company respecting Dundalk and Greenore railway scheme; 5096-5098. Has through rates with the Midland Great

CRAWKELL, WILLIAM, ESQ.—*cont.*

Western from all the principal stations, and with Dublin and Drogheda; also with Ulster, by way of Fleetwood, upon condition that sea risk is taken. Mentions arrangements with the different companies as to through booking, and states that company has to pay the Dublin, Wicklow, and Wexford Railway Company 50 per cent. higher fares than are charged for the local traffic between Dublin and Kingstown out of the through fare, and pay station rent in Dublin and expense of clerks; 5099-5116. 5136-5141. Steam packet companies divide the traffic between Dublin and Holyhead as against Liverpool and Dublin. London and North-western authorized to run steamers between Holyhead and Dublin and Kingstown. Cannot put on boats to Greenore; 5117-5120. Carries cattle from Dublin to Manchester by way of Holyhead. Reason why they are not sent through Liverpool; through rate same by both routes. Not same rate from Holyhead to Manchester by railway as from Liverpool to Manchester. Carries traffic between Liverpool and Manchester to satisfaction of steam packet companies and the public; 5121-5134. By way of Holyhead the steamers and railways belong to London and North-western Company; by other route, the steam packet companies are paid, and difference charged on the railway; 5135, 5136. Traffic in goods from Ireland does not much increase. No reason why cattle traffic in Ireland should not be carried on as in Scotland, notwithstanding transhipment necessary to bring in traffic to England. Facilities afforded by Midland Great Western Company, and at Holyhead for sending this traffic to London; 5142-5145. If rates were materially reduced goods traffic would increase considerably; but companies would not get so large a profit as now. Great benefit would result from amalgamation in Ireland. Tried to make arrangement with respect to a group of railways which lie about Dundalk, but did not succeed owing to the different values of the properties; 5146-5149. Difficulty in putting a value upon non-paying dividend lines; might be assisted by borrowed money with regard to their loans; 5150, 5151. Irish railway companies cannot work together, and make their through arrangements as in England; 5152. Absence of through arrangements beneficial to steam packet companies; 5153, 5154. If traffic fairly dealt with between steam packet and railway interest does not think that either would be damaged. Is not aware of any case in England where traffic is encouraged in some particular direction by offering advantages to persons so to send it. Railway companies have a legal right to make their own rates and develop traffic in their own way; 5155-5161. Parliament could not compel companies to give equal rates for goods whether carried by railway or steamboat, unless they guaranteed them a reasonable dividend; 5162. If Irish railways were amalgamated under one company they could not be properly managed; might be divided into three or four systems; 5163, 5164. 5195. 5206. States length of system, gross receipts upon traffic of London and North-western and whole of Irish system. Reason why latter more difficult to manage; 5165-5169. A connecting link in Dublin between all railways that come into Dublin would materially facilitate general management; an Act has been obtained for the purpose, but scheme languishes for want of capital. It would even be to interest of London and North-western to contribute to have link supplied; 5165-5173. If railways could be under one management shareholders and the public would be much benefited; 5174-5179. If Government took Irish railways in hand they would find English companies ready to work them, and by allowing them 50 per cent. of the gross receipts they would have an interest in developing traffic; 5180. 5246-5249. Reasons why it is not advisable to lease lines to a limited liability company. Question discussed; 5181-5185. 5189-5194. 5198-5204. 5207. Upon amalgamation Irish railways would reduce their rates and develop a trade which does not now exist, and at same time secure a gain to the companies; 5186-5188. If all the southern railways were amalgamated into one company it would not be to their interest to carry all the traffic to Dublin so as to have the longest mileage; 5196, 5197. Thinks traffic from south of Ireland to Scotland is nearly all taken by sea; 5205. Beneficial results have followed where Government have assisted railways in agricultural countries in Europe. Does not see any objection to Governments proposing reduction and bearing loss until traffic increased; there would be no ultimate loss; 5208-5210. Irish system of management not satisfactory, and the mere conversion of the railways into two or three systems would not be attended with any important benefit unless there was some alteration made in the boards or some control by Government; 5211-5216. Has

CRAWKELL, WILLIAM, ESQ.—*cont.*

found it difficult to make arrangements, as boards of directors adhere to system of exacting local charges, cartage, &c. If Government appointed good commercial men as directors on Irish boards, matters would be improved; 5217-5221. Discussion as to whether goods can be shipped cheaper from Dundalk through to Manchester, or consigned to an agent at Liverpool to send on to Manchester; 5222-5236. At present there is no through arrangement with respect to coal; company is about to establish a trade by joining some of the Lancashire coal owners in making low rates to Liverpool for the purpose of shipping coal to Ireland. Coal owners have no shipping trade from Liverpool; is principally down to the northern ports. London and North-western Company have applied to Parliament for authority to make a line from Wigan to St. Helen's to join the St. Helen's railways, which will give an access to Widnes and Garston, considerable places for shipping purposes; 5237, 5238. No communication in Dublin between railways and wharves; if connecting link made it will come down to the quays; Bill before Parliament to make tramways along the quays; 5239. If arrangement with Lancashire coal owners carried out coals will be much cheaper in Dublin and in the interior of Ireland, and a large trade will be established; 5240-5245.

CLANCARTY, THE RIGHT HON. THE EARL OF. (*Analysis of his Evidence.*)

Has been for seven years director of the Midland Great Western Railway of Ireland, has regularly attended meetings of the board, and has taken great interest in all their proceedings; 6283, 6284. Moved resolutions for reducing fares to what they were in 1861, when they were raised 10 per cent. Quotes rates for passengers, and receipts, which show that up to 1861 there was a steady increase, but from that time receipts began to decline. Produces a return showing the falling off in 1st and 2nd class passengers, and also in the receipts. General depression in the country about this time, but does not attribute falling off to this circumstance, but the raising of the rates; 6285-6305. 6313-6316. Directors cannot lower rates without appearing to run in rivalry with Great Southern and Western. No attempt made to amalgamate the two companies. Proposed to try as an experiment a reduction of 10 per cent. on portion of the line from Althone to Galway, and guaranteed the company from loss, but board refused; the fares in consequence have fallen off considerably. Reason assigned was, that as there was to be an International Exhibition this year, higher rate of fares might be more productive, an expectation which has not been realized; 6306-6311. 6318-6325. Cannot venture to say in how long a time a reduction of 30, 40, or 50 per cent. would recoup itself; but states that upon first joining board, fares were moderate and traffic increasing, when rates were raised the reverse was the case; 6312. Considerable emigration from west of Ireland; 6317. Would amalgamate all the Irish railways and put them under Government control. Private enterprise in Ireland connected with railways almost extinct. Much depends upon facilities given by railways for transmission of manufactured goods. Is not aware of any special manufacturing or other establishments of any kind which have been got up in consequence of introduction of railways; 6326-6329. Evils that would have been prevented if railways had originally been in hands of Government, and benefits that would accrue by their being under such control. Mentions condition of Irish North-western railway, and states that on many railways, in order to make good dividends money is appropriated to capital which ought to be appropriated to revenue; 6330-6337. 6339, 6340. 6358. A board of directors not prosperous in way of earning revenue, much tempted to starve a line and postpone necessary repairs and expenditure which ought to be carried on every year in order to increase the permanent revenue; 6338. Was one of a deputation to Chancellor of the Exchequer to propose that 1,000,000. should be advanced at 3½ per cent. to replace debentures bearing interest at 5 per cent., the profit to go entirely towards reduction of rates, but the proposition was declined. Better plan would be to leave debentures as they are, and for the share capital to be taken up by Government, who would then become the absolute owners of the railways. The experiment might be first tried in Ireland, as it would develop resources of the country. Small permanent board with two subordinate boards would be sufficient to manage the railways. Would be less danger of abuse if patronage of appointment of officers were placed in the hands of a board presided over by a member of the administration. As to Govern-

CLANCARTY, THE RIGHT HON. THE EARL OF.—*cont.*

ment patronage in Ireland; 6341-6350. Similar boards have been appointed to carry out great works in Ireland, but have not been very successful; instances board for improving drainage of the river Shannon; 6351-6354. Scheme of taking over Irish railways by Government would be sanctioned by the Legislature if they desired the welfare of Ireland. Would be best to tax Ireland by a special rate to make up for temporary loss rather than scheme should not be tried; would do away with any jealousy that might exist in the sister country; 6355-6357. Basis of purchasing Irish railways laid down in the Act of 1844. Government would be paying too low for them upon those terms, as even from present unfavourable circumstances dividends will rise; 6358-6361. The most important matter would be lowering the rates so as to develop resources of the country. Directors are afraid of lowering cattle rates, thinking that if they did not answer they would not be able to go back to the old rates; and in consequence cattle are driven by the road. Government could make better regulations, especially in parcels traffic; could also regulate the mail trains, and do away with the necessity for carts, cars, and foot messengers; 6362-6364. Government would not be strictly borrowing the money for purchasing railways, it would merely be a conversion of railway shares into Government stock. The annual charge for the interest upon capital advanced would be necessarily considered as one of the ingredients in the charge upon railways. Government should become possessed of the railways, and should not lose by the arrangement: might be done with benefit to present shareholders and to the public, and would lead to a reduction in the rates; 6365-6375. Has not formed any opinion whether it would be better for Government to work lines or grant leases. Hands in memorandum of comparative statement of weekly receipts from passenger traffic on Midland Great Western for year ending January 1865. A small reduction made this year in carriage of cattle, and a steady improvement has taken place in the traffic; 6376-6378. Wages increased in west of Ireland during last few years owing to emigration. Hands in table headed "Abstracts from half-yearly reports of "Midland Great Western Railway;" 6379-6381.

COOPER, MR. JAMES C. (*Analysis of his Evidence.*)

Has been engaged privately in cattle trade, and paid attention to transit of animals by railway in south of Ireland; 3648, 3649. If greater facilities were afforded, trade would increase; facts in support of this opinion; 3650, 3651. Reckons that whole stock of farmer travels once a year. If rates were lower, a large proportion would use railway that now travel by road. Does not agree with opinion that railways carry the greater part of cattle in vicinity of the line; discussion as to how much the cattle travel; 3652-3666. Complaints made of high rates, and opinion that a reduction of one-third would materially increase traffic; 3663, 3664, 3690. Rates nearly equal on all the railways; lowest on Waterford and Limerick, on which there is a great traffic; does not know rate on Midland line; 3665-3670. Almost all fat cattle go by railway; for distances under 8 miles they would go by road; 3671-3674. A reduction would not induce farmers to fatten more beasts; the increase would be in store cattle; 3675-3678. Calves are enumerated as horned cattle; 3679. Delay in movement of cattle in large districts where there are no railways; in those counties cattle are raised to be fattened in dairy counties, so that one of the journeys would be partially made through districts where there are no railways; 3680-3682. Points out certain places where store cattle are driven from 50 to 100 miles, although in the vicinity of railways; discussion thereupon; 3683-3689. 3697-3699. Compares rates on certain of the English and Irish lines; 3691-3696. 3700-3704. Thinks that only a small portion of the cattle driven along the road are disposed of on the way; 3705. Gives cost of driving cattle from western part of county of Limerick to Ballinasloe fair, compared with railway charge; 3706-3710. How calculation made that railway companies could reduce one-third; 3711-3713. Reasons why three-fourths of the pigs are sent by railway; 3714, 3715. Quotes certain rates for corn and hay, and states that if rates were reduced, corn would be sent by railway and not round the coast. Mentions certain complaints made by drovers against the companies; 3716-3729. Condition and weight of animals much deteriorated by sending them long journeys on foot; number of miles per day fat and store cattle should be driven; reasons why store cattle are sent by railway although driving by road is cheaper; 3730-3743. Unequal charges for turf and parcels on same line; there is a considerable expense at the stations

COOPER, MR. JAMES C.—*cont.*

for turf, and charge would be proportionately high for short as compared with long distances; gives examples; 3744-3751. 3756-3758. The Waterford line publishes lists of charges; has never compared them with the English; 3752-3754. 3759.

COTTON, JOHN EDWARD, ESQ. (*Analysis of his Evidence.*)

Is manager of the Belfast and Northern Counties railway; 7783. Works the Derry and Coleraine line at a mileage rate: states rates and limit to number of carriages; all expenses are included in the rate except renewal of the line, which is to be done by Derry and Coleraine Company. How renewal provided for; 7784. 7876-7885. 7898-7905. Contradicts evidence given by Mr. Roe, who states that when Northern Counties Company took up Derry and Coleraine line in April 1861 they increased the fares; they were increased 5 per cent. over whole system in December 1863. Hands in table showing the fares in 1861 and now. Reads a statement made by Mr. Garrett (ticket clerk at Derry) stating that no alteration was made at that time. In several instances increased facilities were since given to the public. Long discussion as to whether the increase has not checked traffic and reduced receipt. Increase was only carried out upon the long distances, and witness believes that company made the whole of the 5 per cent. increase. Has not heard that increase inconvenienced the public. Population throughout Derry and Coleraine line decreased since 1863; 7785-7788. 7818-7823. 7829-7873. Cannot find that in Mr. Roe's time fourth-class fares for harvestmen and others existed; reads an extract from a letter written by Mr. Hamilton upon this subject; 7789. Hands in a time table of Mr. Roe's and one of last month, showing the increased accommodation; 7790. Explains certain statements respecting fares and management of the railway, and mentions the advantage that has arisen from having certain lines worked under one management; 7791-7793. Reduction of receipts attributable to state of country and other causes, and not to advance of rates as stated. Receipts have considerably increased this year. Gives receipts of the Derry and Coleraine line in each year from 1860, and explains cause of decrease; 7795-7808. 7814-7817. Is mistaken in supposing that Mr. Roe included in his receipts the profit on the coal traffic carried on the line; 7810-7813. Believes that on business lines a reduction in rates would be followed by a diminution in receipts. Fares cannot be too low for short pleasure lines. Issue tickets to certain watering places in summer time at very low fares; also market tickets at single fares; cannot find that there was anything of the kind in Mr. Roe's time. Gives rates per mile for each class, and states that low wages prevent the labouring classes from travelling. Their position is improving; 7824-7828. Only closed two small stations upon taking the railway from Mr. Roe; the earnings were very small; was advised by that gentleman to close these and one or two others; 7874, 7875. Number of trains have been reduced on whole system since 1863; 7886-7889. Gives number of passengers the carriages will convey, and the width of gauge; 7890-7892. Does not know whether Mr. Roe made a profit of the line after paying a rental of 10,000*l.* a year; considers that their company lost money by working it; felt most the renewal of the line, which required new rails and sleepers; 7893, 7894. Explains how receipts of line are disposed of; is not sure whether the balance this year will pay the bond-holders; ordinary shareholders will get nothing; thinks they do not expect anything; 7895-7897. With one restriction Derry and Coleraine line may alter the rates; 7906. With what lines witness's railway is connected; not with any to the south. Line being constructed from Antrim to Lisburn, which will connect the Ulster and all railways as far as Dublin, will be an advantage to Belfast. In consequence of there being a shorter route, Northern Counties line would stand no chance by running trains direct from Dublin to Londonderry. Bill passed last year for connecting lines at Belfast. Shares are not yet issued; 7907-7915. 7932. Has had some experience in railway competition; in Ireland there is not sufficient traffic to support competing lines; is different in England. Reason why having a second communication between Belfast and Londonderry is of no advantage to either place; is a benefit to those who live between Omagh and Dungannon. Although no advantage to public living at the terminal towns from the competing lines, has injured both the Derry and Coleraine, and Northern Counties lines; 7916-7928. If two companies competed in an Irish rural district, they would

COTTON, JOHN EDWARD, ESQ.—*cont.*

half ruin one another, and then combine and raise the fares; 7929, 7930. Scheme before Parliament last session for making a line from Cookstown to Armagh; 7931.

DARGAN, WILLIAM, ESQ. (*Analysis of his Evidence.*)

Is a contractor; is now chairman of the Dublin and Wicklow Railway, and was for several years a director; 5453-5455. Has paid much attention to Irish railways generally; 5456. Fares will not admit of reduction unless companies are aided. Most Irish railways are in debt. Fears reduction of rates would be attended with permanent loss to the companies. Founds his opinion upon absence of population. If all the railways were finished for which powers have been obtained, Ireland would be well supplied; 5456-5459. 5483-5488. Quotes rates for passengers and the four classes of goods; all the Irish railways adopt same classification. Minerals are charged less than first-class goods. Explains that there is much work to do for this traffic besides haulage; calculates expense of extra work at about 1s. 3d. per ton. Haulage is expensive, in consequence of the bad inclines and short distance; 5460-5467. 5622. 5631-5636. Return tickets at a fare and a half are issued to third-class passengers, and third-class carriages are run by every train. Passengers (chiefly artisans and labourers) are carried twice a day to Dublin, Kingstown, and Bray for $\frac{1}{2}$ d. a mile. Carrying passengers on that portion of the line answers, numbers being much greater. Low fares have been in operation for 12 months; no increase in the gross receipts, but large increase in traffic; very little additional expenditure. Other places of importance on line, but no difference made; 5468-5482. By amalgamating several small companies into one, a considerable saving would be effected. Thinks Irish railways at their present rates might be worked for a little over 40 per cent. of the gross receipts. Average cost of working English railways 50 per cent.; explains how saving would arise; 5489-5492. 5609-5615. Thinks amalgamation could be carried out at some future time without Government or Parliamentary interference. No difficulty in whole of Irish railways reducing themselves into two or three systems. The directors would consent to any scheme that would put their property in a better condition, but the officers would object unless they received compensation; 5493-5503. Has considered proposition of Government purchasing Irish railways. If Government brought to their aid their better credit, and obtained money at a low rate of interest, great good might be done; Government ought not to sustain a loss. If Dublin and Wicklow Company were assisted in this way to the extent of a million and a half, they would not object to reduce rates 30 per cent. on certain traffic. Good security would be given. Peculiarity of this railway; 5504-5511. 5655, 5656. If extensive reductions made, there will be permanent loss; reduction of one-third would cause temporary loss. Could not reduce to this extent without Government help. Thinks it could be proved that Government would incur no risk in making advance; money would be employed in completing line and reducing interest upon money borrowed; 5512-5517. Quotes dividend paid and amount of capital. Cannot say how the Government by guaranteeing new preference capital would relieve companies from any amount of interest; 5518-5525. How railways paying no dividend should be dealt with; 5526. About 26 millions already laid out upon Irish railways; believes the whole could be bought without compulsion for about 22 millions; data upon which estimate formed; 5527, 5528. 5551-5557. Upon amalgamation there would be a saving of one-fifth in the working expenses. Does not think any company would refuse to sell to Government if a fair offer were made; 5529-5534. Amalgamation would not interfere with further extensions. There are bills now before Parliament for the construction of railways; justification for applying for those lines in county of Wexford. Very few districts that would justify a railway being made; 5535-5540. Shares of insolvent companies have a nominal price in the market; some of them are as low as 15 per cent. Is sorry that rule laid down has been abandoned, that parties applying for a Bill should prove their capability of making the line; discussion as to how solvency should be proved; 5541-5545. 5548-5550. Where new and old lines have come into competition they have damaged each other; 5546, 5547. If Government purchased railways, a special board might work them. Leasing them to any private company would not be an improvement as regards the country. Does not understand how such a board would be subject to political influence. How it should be constituted. Would rather place railways

DARGAN, WILLIAM, ESQ.—*cont.*

under private management if conditions could be inserted in lease to protect the public, and the property and interests concerned; 5558-5567. 5576. If Irish railways became the property of Government, some of the great English companies would become competitors for the lease; they might meet a little loss upon Irish side, but recoup themselves on English side. Whether a benefit would accrue to Ireland would depend upon conditions of lease. Would work well if parties applying for lease were to tender to work lines under certain maximum rates fixed by Government; the lowest offered should be taken; 5568-5572. Dublin and Wicklow is a line of 120 miles; has equal mileage rates both for passengers and goods, with exception of working people's train; 5573-5575. 5648, 5649. Certain landholders have made advances to promote construction of railways in parts of Ireland; 5577. Landholders and agriculturists would be greatly benefited by an extensive reduction, but would not be willing to give any security to carry out scheme; 5578-5582. If companies could not find security to justify Government in applying funds of United Kingdom, cannot suggest how Irish people could assist themselves. Objection might be made if a Government subsidy were granted to Irish railways and not to railways or other industrial undertakings in England, but exception should nevertheless be made; 5583-5592. Very little coal wanted for manufactures in Ireland, except in the north, there being plenty of water power. Manufacture of wool and flax would not be much affected by a reduction of rates; 5593-5602. Peasantry are not likely to do injury to railways, if property of Government; 5603-5605. If matters left as they are, amalgamation will be very slow; 5606-5608. Average cost of keeping up permanent way in Ireland about 80%; more in England; upon Dublin and Wicklow line about 85%; 5616-5621. Is supplied with a large quantity of traffic from mines at Vale of Avoca; increase since accommodation afforded; rate charged fairly remunerative; mining companies pay high dividend; not a fair test of charge to reckon rate as a per-centage in value upon goods carried; 5623-5630. A partial reduction might be made without loss; Dublin and Wicklow would be better pleased to get one-third of the assistance required, and reduce rates 10 or 15 per cent., than to have full amount and reduce 30; reason why this railway is in a peculiar position to test principle; 5637-5639. 5650-5652. Rate reduced within last two years, but not much benefit has accrued; 5640, 5641. Parcel rate low; season ticket holders get theirs carried for nothing; is not a good system, being open to abuse; parcels are not delivered by company; number carried by season ticket holders; 5642-5647. 5650. 5653, 5654. Doubts whether third-class fares could be so low as to take away inducement to walk. Irish labourers have no occasion to travel, small shopkeepers do. There would be a great advantage in reducing third-class fares; 5657-5662. Purchase of Irish railways by Government should be voluntary on company's part; a few might stand out, but traffic might be so worked as to force them in; Government offer should be conditional upon all the railways accepting it, otherwise small companies might stand out. Some precautions would be necessary to prevent impediments being thrown in the way of traffic being worked over lines of those railways holding out; 5663-5675. Midland Railway Company leased their line at one time, and their rolling stock and permanent way were allowed to get into bad condition. The public were served properly. There were clauses in lease to prevent deterioration, but they were found to be defective; companies leasing a line would look more to present than ultimate profit. There would be no difficulty in securing owners of railways against injury; 5676-5687. Leasing company should have a maximum fixed, but should be allowed to reduce as much as they liked. Maximum should be lower than present rates. Would make an uniform charge per mile, and allow a terminal charge that would regulate it; there would be a higher rate per mile for a short distance than for a long; 5688-5699. Would have a fixed terminal charge at a particular place; cartage and labour should be separate. Terminals include only loading and unloading at stations. Should be a maximum rate for terminals. Would allow companies to carry any particular description of traffic at any rate they pleased, but they should not carry between same places at different rates for different persons. Not fair to carry at a less mileage rate into one district than over line generally. A discount might be allowed for quantity. If all railways were in the hands of one company Board of Trade should prescribe and equalize rates. Special rates could not be prohibited. All rates should

DARGAN, WILLIAM, Esq.—*cont.*
be published; 5700-5718. If railways in hands of one company, and they found upon one part of their system they could get traffic at 1d. per mile, whilst upon another it could not be got if charge more than ½d., they should be left free to act, provided they did not exceed maximum, and treated all alike; 5719, 5720. System of discounts places small traders at a disadvantage; allows a differential rate upon a single waggon, so that it does not affect the poor man so much as it did; 5721-5724.

DELAHUNTY, MR. JAMES. (*Analysis of his Evidence.*)

Is managing director of the Waterford and Kilkenny and Kilkenny Junction railways; 5011. As far as Waterford is concerned there is great difficulty in approaching the interior of Ireland from want of railway communication. Complains of want of accommodation from Great Southern and Western Company not running trains from and to Kilkenny at convenient hours; gives instances and suggests a remedy; 5011-5014, 5018-5026. Passengers from Waterford and Dublin cannot go by way of Kilkenny and return same day. Great Southern and Western the only line from Dublin to Waterford. This railway has always opposed any scheme for connecting the North Midland Railway of Ireland with Waterford; nevertheless an Act was obtained in 1860 for making a line from Kilkenny to Maryborough; constructed as far as Abbeyleix, and traffic of the district in eight weeks has increased 33 per cent. Object of the Great Southern and Western in opposing; 5015-5017, 5027-5032. London and North-western and Great Southern and Western have lately entered into an arrangement with Mr. Malcolmsen (a large steam-packet owner in Waterford), for the steamers, and Limerick Railway Company allowing them 30 per cent. of all monies received for traffic brought by Dublin to allow it to go by Dublin, although they may do nothing to earn it. Hands in heads of arrangement, and shows how it has the effect of diverting traffic of district through England by Dublin and Holyhead, and injuring communication between southern parts and England. There should be some tribunal to prevent railways diverting traffic, and a large company subsidizing a small one; 5033-5047. Mr. Malcolmsen is a resident of Waterford, and has a large interest in the railways and steamers. Thinks the London and North-western must have entered into arrangements with him, not alone in connexion with Waterford interest, but in connexion with their other interests; 5048-5050. Arrangement, though not illegal, is exceedingly injurious to the public interests. Reads a resolution adopted at a meeting of merchants, traders, and citizens of Waterford; 5051, 5052.

ENNIS, JOHN, Esq., M.P. (*Analysis of his Evidence.*)

Is chairman of Irish Midland Great Western Railway; 4011. Was its originator, and has been for 20 years connected with railway and paid much attention to its affairs; 4012, 4013. Question of reduction of fares has often been submitted. Thinks traffic in Ireland a limited quantity, and that any reduction would not bring a compensating receipt in money. Admits that his company do not carry all that could be carried; 4014, 4015, 4066-4068, 4212. No experiments have been tried, the fares being low. For many years harvest labourers have been carried at ½d. per mile; a great many still walk or go by car; gives distance and rates by the cars. If a large reduction were made in fares, the receipts might recover in four or five years, but shareholders would not like to go without a dividend for that time; 4016-4024. Would not pay to charge such fares as are charged on some of the excursion lines in England; 4025, 4026. Not aware that low fares have been tried on the Londonderry and Coleraine line. In Ireland passenger and goods rates nearly uniform. When a railway is subsidized low fares can be introduced, as shareholders do not suffer; 4027, 4028. Third-class passenger fare is ½d. and one-tenth per mile; is not in excess of the Act. Parliamentary trains are run one each way daily at 1d. per mile; 4029-4032. Harvest men are generally carried by ordinary train; sometimes sent by special; this traffic has increased; gives number carried in three half years. Reason why they are not taken by fast train. Doubts whether ½d. a mile would pay. Could take them for half-price if a certain number came in a day or week; 4033-4035, 4072-4081. Number carried during latter half of 1864. Third-class passengers increasing; attributes this partly to emigration; 4036-4039. Cattle traffic at a standstill; arises from scarcity. No reduction of fares would increase traffic; considers rates reasonable; has lately made a small reduction. Reasons why fast cattle are sometimes driven; gives

ENNIS, JOHN, Esq., M.P.—*cont.*

number of miles they go, and states that injuries received in trucks are not comparable to wear and tear along the road; could not drive cattle so far in summer time; 4040-4049, 4053-4059. If rates were reduced there would be an increase in store cattle traffic, but doubts whether it would be profitable. Facilities at every station for putting cattle into trucks. A great number of store cattle still travel by road. Quantity carried regulated by number of trucks possessed; at Ballinasloe fair the supply deficient, but at other fairs, when supply ample, do not get all the traffic; sometimes borrows rolling stock from other companies; 4050-4052, 4060-4063, 4069-4071. Does not know proportion that travel by railway and by road, or proportion of the whole cattle that travel in a year; 4064, 4065. In 1860, at the suggestion of Mr. Forbes, passenger fares were advanced 10 per cent.; receipts considerably increased; does not know whether the passenger traffic diminished. Last half year revenue fell off; ascribes this to impoverished state of the country; 4082-4085, 4094-4099. Return tickets are issued from market town to market town. A considerable number avail themselves of them. Principal market towns on line; 4086-4088. All persons who will travel by these harvest trains are treated in the same way. Women and children would not be refused if they came. They are all through passengers; 4089-4093. Would like to see amalgamation tried, as it would diminish expense of management; 4100, 4101. Gives length in miles of Midland Railway proper, and names small lines rented, &c. by that railway. Equal mileage rates over whole line; 4102-4105. Lord Clancarty was so persuaded that low fares would be remunerative that he proposed to try a reduction between Athlone and Galway, guaranteeing the company against loss. Difficulties in the way that caused proposition to be declined. Discussion as to responsibility of grand jury of Galway in consequence of Loan Act of 1849; 4106-4116. Where there is an increase of tonnage and receipts for coal and coke it must be attributed to wet years and difficulty in getting turf; 4117-4122. Dissents from opinion expressed by Mr. Forbes that by reducing rates for coal to ¾d. per ton per mile it could be delivered to all parts of Ireland for 16s. or 17s. per ton, as that is the price paid at Dublin. Gives price at the quays, cartage paid, and cost of delivery to certain places; 4123-4133, 4139-4142, 4146, 4147. Proportionate consumption would not increase by reducing to ¾d. per mile; 4134, 4135. Cheaper for witness to burn coal than turf. In wet seasons the latter is worthless; 4136-4138, 4148-4150. Reasons why the masses could not use coal; 4151, 4152. A full train load consists of 40 or 50 trucks: one locomotive would take about 120 tons of coal. Trade in coal does not exist, the quantity required being small, and use of it opposed to habits of the people; 4153-4159. Groceries, wines, and spirits are the leading articles of the goods traffic. Carries a good deal of corn, but trade variable. Does not carry turf, it is taken by the Royal canal, which is owned by the Midland Great Western; they do not interfere with the traffic on it, but leave that to option of freighters and private enterprise; may charge any rates it thinks proper. The Grand canal are empowered to charge from 10 to 15 per cent. lower than the railways, and the freighters may charge what they like; 4160-4180, 4210. As soon as company possessed the canal (about 18 years since) they reduced the rates in order to secure traffic which before was sent by road; there was a large increase in traffic and receipts, which continued until company ceased to be carriers on the canal, and threw it open to public competition. From that time the tonnage receipts have not increased; 4181-4183, 4186, 4187, 4190-4197. Does not obtain an income from canal equal to interest parted with in price paid for it, but was enabled to make part of railway on banks of the canal. Expense of keeping canal in repair small; 4184, 4185. Has an agreement with Mr. Wallace to receive and deliver goods in Dublin, Galway, Sligo, and Athlone; 4188. Cannot state relative rates of charge for cartage and by railway conveyance; 4189. There are no mills in neighbourhood of line of railway. Offered some time ago to take minerals at a very low rate, but in consequence of difficulty in getting them to railway they were not sent. Has had no other application for special rates; 4198-4203. Fish traffic an advantage. Valuable fish travel by night trains; inferior is taken at very low rates. Explains why Galway fisheries are totally neglected. Unproductive state not owing to want of facilities by railway companies. If English fishermen went to west coast of Ireland they would not be allowed to fish; 4204-4209. Has an arrangement with Great Southern and Western Company by which

ENNIS, JOHN, ESQ., M.P.—cont.

steamers are prohibited from plying upon any navigation; 4211. If low rates and fares were tried, it could only be done at expense of shareholders; 4212.

FEARNLEY, MR. BENJAMIN. (*Analysis of his Evidence.*)

Is secretary of Newry and Armagh Railway Company. Traffic is very seriously interfered with by competitive measures of certain companies with which this railway is connected. Mentions companies which divert the traffic. Through rates have been refused by these companies. Business communications and trade with port of Newry lies in Monaghan and Clones districts; chiefly inward coal traffic; a great deal of traffic in grain and bread stuffs in that district and some extensive mills, also a traffic in slates, timber, and agricultural produce; 4965–4970. Companies desire equal rates by both routes to Monaghan, and division of traffic. Difference in distance in favour of Newry and Armagh getting passenger traffic; 4971–4975. Doubtful whether Monaghan district would be better provided for by amalgamation with Ulster company. Newry and Armagh a local company; chiefly English capital; 4976–4979. Thinks the Cardwell Act does not meet evil complained of, but has not tried its efficiency; discussion thereupon; 4980–4983. 4991–4998. 5005, 5006. If a through rate were established, there would be a great traffic in grain and minerals. Where grain sent to, and for what purpose; 4984–4987. When railway made, expected to be able to make arrangements with other companies. Why company did not form a station at Armagh; 4988, 4989. When section from Gorah wood opened, has had no through rate since. Population of district lying between Gorah wood and Newry is denser than any other part of known world, except China; 4990. 4999. Quotes fares for third-class passengers between Newry and Armagh (22 miles). Gets all the direct passenger traffic. Reason why does not get all goods traffic; 5000–5004. Amalgamation would not cure all the evils of present system; it would then be the joint interest of companies to get as much traffic as possible upon each railway, but not to develop all the ports equally. A powerful port like Belfast would very likely have a greater interest in a long route than a small port like Newry. Reads and hands in correspondence received, illustrative of the inconvenience of not having through rates. Has complied with every request made for exchange of through rates; 5007–5009.

FORBES, MR. WILLIAM. (*Analysis of his Evidence.*)

Has been engaged 20 years in the management of railways in England and Ireland, and until recently was manager of the Midland Great Western and the Great Northern and Western lines; 1453–1456. Is familiar with all the systems of railways in Ireland. Present rates are prohibitory of any development of traffic. Irish rates, both for passengers and goods, are as high, and in some cases higher, than English rates; if they were lower there would be a large increase in traffic, and the country would be greatly benefited. Has proposed to the directors a reduction of 50 per cent., but as there would be a temporary loss of dividend, they did not accede to the proposition; 1457–1463. The rate for coal is double what it is in England; rates for coal and grain stated; 1464–1475. Thinks coal could be carried all over Ireland at a rate of $\frac{3}{4}$ d. per ton per mile; if so it could be sold for 16s. or 17s. per ton; 1476, 1492. Coal traffic very limited. The Midland Great Western system extends over about 330 miles, and the traffic in coals is only 200 tons a week. The gradients upon that line are very fair, but near to Dublin the curves are bad; 1477–1482. Believes that if coal could be had for 1*l.* a ton, it would supersede turf and be more economical. Discussion as to how present rates prevent this result; 1483–1485. 1537–1548. The gradients on the Great Northern are as adverse for some short distances only as those on the Midland Great Western. The cost of carrying coal depends very much upon the gradients; 1486–1488. Recommended the directors to reduce the rate upon coal from $1\frac{1}{4}$ d. to $\frac{1}{2}$ d. per ton per mile; they made it $\frac{3}{4}$ d., and the traffic increased 25 per cent. without creating any loss. Anything short of $\frac{3}{4}$ d. per ton would be of no use; reasons for this opinion; price of coal in Galway, Dublin, and Cork; 1489–1514. 1524–1527. 1549, 1550. A uniform rate of $\frac{1}{2}$ d. per mile would be remunerative to the companies; they would get full train loads, one engine taking about 315 tons; 1515–1521. The directors refused to make a general reduction in the tolls, being afraid of a loss of income. Opening a new piece of line at a reduced rate would create dissatisfaction; 1522, 1523. It is a common opinion among the Irish directors that there is a

FORBES, MR. WILLIAM—cont.

fixed quantity of traffic, and that no reduction of rates will increase it; 1528, 1529. Witness calculated that if the rates were reduced to $\frac{1}{2}$ d. per mile, the coal traffic would have increased ten-fold; 1530–1534. Suggested to the directors to become coal merchants, but they refused; 1535, 1536. If a reduction were made of 50 per cent. there would only be loss for two or three years. Reduction could not be made piecemeal for passengers. There would not be the same loss upon coal; but in the case of passengers there would not be such an increase as would recoup the loss until after expiration of two or three years; 1551–1560. Considers that the entire traffic of the country might be increased by a reduction of rates; 1561. Coal is a very important article of traffic. If rates were lower, cattle might be carried by railways. Gives present rates; 1562–1568. On the Midland Great Western the profits from passengers and from goods are about equal; 1569–1573. Has been told that if the rates were reduced $\frac{3}{4}$ d. a waggon per mile (50 per cent.) all the store cattle would be put upon the railway. This would be worth the companies' while for a distance of 20 miles; 1574, 1575. If experiments were made there would be a loss for some time upon the general traffic. Does not think the directors are to blame in not acceding to such a reduction; 1576–1580. Proposes that the earnings of a full waggon should be $\frac{3}{4}$ d. per mile. Gives calculation as to expense of conveying loaded trains. States that this sum would be remunerative to the companies. Discussion thereupon; 1581–1616. 1626–1633. Midland Company have a canal of their own running alongside the line from Dublin to Mullingar, and to Longford. A little coal and turf is carried upon it, but the company ceased to work it, because there was not sufficient traffic for both; 1617–1622. The Great Southern and Western Company compete with the Grand Canal. Competition had the effect of lowering the rates, but in the last two or three years they have come to an agreement and work on differential rates; 1623–1625. About 10 loaded trucks go daily through from Dublin to Galway. Thinks the number would be doubled by a reduction of 50 per cent. At a moderate rate, they would carry an enormous quantity of potatoes into Dublin, and also for the English markets, and there would be a great increase in agricultural produce generally, and in manufactured goods from England; 1636–1638. 1641–1644. The grain that is consumed on the Midland Great Western line comes from the districts about Sligo, and from up to Longford; 1639, 1640. Through rates to a small extent between manufacturing districts of England and ports of Ireland upon almost everything but cattle have been in existence for a year and a half upon the Midland Great Western. Companies will not agree to a mileage division of rates. Gives some particulars; 1645–1650. The reason why there is no through rate for cattle on the Midland Great Western and Great Southern and Western lines is that they have to make good any loss that may arise, whereas steam packet companies are protected by their bill of lading, and will not join the railway companies in the risk. Railway companies have not had to pay a heavy sum under this system; 1651–1658. Great Western Railway passes through a limestone district, but there is no traffic in lime. In Cavan there are some minerals which could be worked at a moderate rate, if coal could be got to them. On some of the northern railways a considerable quantity of coal is carried; 1659–1666. The third-class passenger traffic is capable of the greatest increase by adopting low fares. There are no third-class return tickets issued by the Great Southern and Western and the Midland Great Western. The latter runs a train on market days at a single third-class fare. Third-class return tickets are issued by some of the English railways; 1667–1669. 1683. Excursion trains have been tried on the Midland Great Western to a very limited extent. Excursion tickets, in connexion with English railways, are issued at single fares; 1670–1673. No passenger duty in Ireland. It is 5 per cent. in England; 1674–1676. Second-class carriages until recently better, and more generally used, in Ireland than in England; 1677–1680. Third-class fare in Ireland 1 d. per mile. There are no regular express trains; 1681–1684. States plan adopted by Mr. Bianconi to make his cars pay; 1685, 1686. Average speed upon Irish railways less than upon English; 1687, 1688. Two months before and after harvest time a large number of men are carried from Ireland to England at the rate of $\frac{1}{2}$ d. per mile; 1689, 1690. If a charge of $\frac{1}{2}$ d. per mile for third class were universal, travelling would be considerably increased. Season tickets have been tried, but without result. There is a large traffic from them on

FORBES, MR. WILLIAM.—*cont.*

the Dublin and Wicklow line; 1691–1694. Companies do not run a sufficient number of trains for the accommodation of passengers. Has recommended the directors to put on more, but they refused; 1695–1698. Population of Athlone and Castlebar small, the intermediate places of importance are Roscommon and Castlereagh; 1699, 1700. Has never heard of any attempt to create a traffic in milk; 1701, 1702. No parcels traffic of any great importance; 1703. There is only one passenger train from Castlebar to Athlone per day. There should be at least three; 1704–1706. In consequence of the number of interests, railway reforms difficult in Ireland. There are 18 boards to control 1,700 miles of railway, earning 1,520,000*l.* a year, whereas the London and North-western, with 1,200 miles, earning 5,300,000*l.*, has only one; 1707, 1708. Thinks Irish railways would work better if they were all amalgamated in one company. Traffic in England better developed in large enterprises than on smaller lines; 1709–1713. 1724–1726. Does not know the amount of capital expended in Ireland. Discussion as to working Irish railways; 1714–1723. If a law could be passed to compel companies to reduce their rates a guarantee should be given to them for the loss that would arise. States mode by which this might be done. Discussion thereupon; 1727–1729. 1733–1748. Government should not assist companies in carrying traffic below cost price; 1730–1732. The manufacturing industry of Ireland is principally in the north, near the seaports. There would be little railway traffic with regard to it; 1749–1751. By the establishment of facilities you might create a manufacturing population. If Galway was the seat of manufacturing industry the trade of the port would be considerably increased, as well as the wealth of the place, and the receipts of railway companies; 1752–1759. Midland Great Western Company paid last half-year 2 per cent.; has paid 5. Diminution from increase of working expenditure, and renewals of the permanent way, and not from any great falling off in the traffic; 1760–1767. The line from Athlone to Castlebar is only worked by the Midland Great Western. If more trains were run between the two places the dividend would be increased; 1768, 1769. Increase of agricultural traffic must arise from increase of production; 1770–1773. Difficulties in the way of transit and transport prevent an increase of manufacturing industry in Ireland; 1771–1784. If moderate rates were established it would lead to an increase of fish traffic. Gives reasons; 1785–1793. Poultry and vegetables are mostly brought into Dublin by railway; 1794–1797. Railway companies very reluctant to reduce fares unless they think such reduction will be accompanied by an increase of traffic; 1798, 1799. Believes there will be no change unless Parliament interferes. Gives an idea as to what that interference should be; 1800–1802. Thinks the directors would be repaid in about a year for any reduction they might make upon coals. It is not so much loss of dividend as an aversion to change. Could carry treble the quantity with the same rolling stock; 1803–1808. Through rates in connexion with English railways would develop traffic, and would be equivalent to a reduction of the local rates; 1809–1811. Universal complaints of mismanagement of Irish railways. Principally of the high rates; 1812–1814. 4*d.* per mile is the ordinary cartage rate, but no analogy exists between carting and railway carrying; 1815–1819. Terminal charges in Ireland considerable lower than in England. The companies do not cart, it is done by agents who charge what they please, sometimes as much as 75 per cent. of the railway charges; this state of things would not exist were there through rates; 1820–1828. Is in favour of the amalgamation of Irish railways. In consequence of loss of patronage, &c., the directors are opposed to the system. Does not agree with Mr. Dargan as to the sum that would be saved by the amalgamation of all the Irish lines; 1829–1837. Average working expenses of Irish railways 49 per cent.; by better management could be reduced 5 to 7 per cent. About 50 per cent. in England; 1838–1844. Want of competition injurious both to the country at large and to the railway interests; 1845.

FOX, EDWARD, ESQ. (*Analysis of his Evidence.*)

Is a stockbroker in Dublin. Has been engaged in that capacity for 20 years. Has had extensive opportunities of becoming acquainted with value of Irish railways. There are 26; 14 pay an average dividend of 3½ per cent. and 12 none at all, equal to dividend of 1½ upon the whole. Net receipts of Irish railways about 770,000*l.* upon a total of 24,000,000*l.*, or about 3 per

FOX, EDWARD, ESQ.—*cont.*

cent., including debentures, but excluding Government loan, which would reduce average. Does not know extent of Government loan; 6561–6571. Strong desire of the shareholders and the public that Government should purchase the railways. If so disposed, commissioners should be appointed to negotiate with present directors. Boards of Directors would be willing to dispose of railways upon equitable terms. Government would receive warm support from non-paying dividend lines. How value of these railways might be estimated, and what per-centage of original capital offered. Shares are not likely to rise under any system that shareholders would have it in their power to see enforced. Compulsory sale could not be carried out; 6572–6589. 6685–6688. Public complain very much of bad working of Irish railways; 6590, 6591. Could give average price of shares of non-paying dividend lines, and in most cases average price of debentures for a particular year. No great difficulty in estimating value from interest actually paid. Mentions market value of shares and interest paid by certain non-paying dividend lines; discussion as to amount Government should pay for these and for those paying a dividend; 6592–6626. Great disinclination to invest money in Irish railways. Explains why some new schemes are brought forward. Latterly all efforts have failed to induce Irish public to absorb the capital of these companies; have been entirely worked out through instrumentality of railway contractors, who are tempted by the high prices for the works. These schemes are financed in the City of London; no market found for the shares. Much higher prices are paid to the contractor than if company had had the capital and been free to enter into contracts. Contractors paid in shares and bonds. System greatly enhances cost of railway. Recommends, nevertheless, that nominal cost of each railway should be groundwork for determining price. In case of non-paying dividend lines Government might give 50 per cent.; 6627–6640. Railways have been beneficial to Ireland; 6641. Many of the companies in Ireland have had recourse to Lloyd's bonds; how they appear in the accounts; 6642–6647. Government could relieve Irish railways by assisting in financing upon their higher credit. Thinks Government could purchase whole of railways for about 18,000,000*l.*, and could borrow the money at about 3½ per cent.; this, taking last year's return of receipts, would give them a clear profit of 140,000*l.* They would lease lines to one company, themselves keeping perfect control; should be worked with greater regard to public interest and with reference to postal arrangements; there should also be a fixed rate for merchandise and passengers; would reduce maximum fares 50 per cent.; there would be more traffic at these fares. Present directors will not enter upon such sweeping reforms unless aided by Government. In five or seven years the company would recoup itself. Benefits that would arise from such reduction; 6649–6654. 6709–6722. Makes provision in plan for Government purchasing railways out of present receipts; 6655, 6656. If Government purchased railways for 18,000,000*l.*, 12,000,000*l.* would represent the preference shares, debentures, and original stock of railways paying a dividend at par, and six millions would represent the original stock of those lines paying no dividend, being a reduction of 50 per cent. upon original capital invested; discussion thereupon. It would not be quite equitable to take as a standard of value the market price of shares at a time of depression. Great Southern and Western included in those at par. The largest preference stock in Ireland belongs to this railway; is 4 per cent. perpetual, and sells at 94*l.*; 6657–6683. 6702. 10 per cent. upon price quoted would not be sufficient; 6684. Would not be liberal to take present value as real value; 6689, 6690. In one particular instance market value of shares above real value; 6691–6693. Irish shareholders have no privileges in travelling; only advantage they obtain or expect is a dividend, and yet a share to which a dividend of 5*s.* per annum is attached sells for 16*l.* If an average for a certain period were taken of dividend paid to ordinary shareholders and interest paid to preference shareholders and debenture shareholders, and Government were to add a sum somewhat in excess of this, shareholders would be satisfied, as they would be glad to receive a fixed Government rate of interest, even if it were a little lower than they have been receiving. There would be no difficulty in ascertaining payment of past years. Difficulty with the railways that pay no dividend. Shareholders would be satisfied with a small annual payment. Would not do to take average receipts of last five or ten years as a basis for valuation, as those receipts have not admitted of any dividend. If Government came in they would create a market for this property, and

FOX, EDWARD, Esq.—*cont.*

consequently the parties ought to be dealt with upon very liberal terms. Generally speaking, the dividends have been decreasing year by year; therefore if Government agreed to pay a sum equal to average receipts of past years, they would be paying a larger dividend than the shareholders now receive, this of itself would be sufficient bonus; 6694–6708. If Government purchased Irish railways nothing unreasonable to ask Irish public to guarantee them against loss; does not think there would be any, as there would be a large indemnity found to start with, and a great saving effected in management by amalgamation; if there were, might be met by increasing income-tax. Company would probably require the lease for 21 years; 6723–6725. 6727–6731. Amalgamation of any of the small companies with larger ones would not be of much benefit; 6726.

GALT, WILLIAM, Esq. (*Analysis of his Evidence.*)

Is author of a pamphlet published in 1843, entitled “Railway Reform.” States purport of his evidence given before a Committee of the House of Commons appointed in 1844 to investigate subject of railway management; upon recommendation of such Committee a Bill was introduced by Mr. Gladstone, and after very strong opposition, passed, recognizing the expediency of Parliament at some future time considering the question of purchasing the railways. Quotes extracts from speeches made by Mr. Gladstone and Sir Robert Peel upon the introduction of the Bill; 7336–7340. 7346, 7347. In consequence of certain erroneous opinions then prevalent the Bill did not receive much support from the public generally; 7341. Gives mileage and capital invested in railways in 1844 and 1865. Dividend of 8 or 10 per cent. was paid in 1844; 7342–7345. Until recently the Act has not engaged attention of public; 7348. Meaning of “Railway Reform”; 7349. Passenger fares not more than half what they were formerly by coach, but much higher than on the continent; delivers in table showing fares in different countries. Does not know whether less numbers travel in this country; 7350, 7351. 7479, 7480. Fares should not be regulated by those on the continent; 7352. Delivers in table showing how expense of conveying passengers can be calculated; 7353, 7354. Proposes that passenger fares should vary from 2d. down to 4d. per mile by express trains; hands in table giving proposed fares by all trains, including excursion trains, which are generally about one-third of the ordinary traffic, and also tables showing fares on the principal railways in the United Kingdom; discussion thereupon; 7355–7357. 7371, 7372. 7457–7468. 7481–7489. Accounts for the great difference in fares by various companies; former system of calculating them not followed now to same extent; 7358–7360. In 1844 witness arranged and classified several cases, showing the very little variation made in the charges by each company; instances the Glasgow and Greenock line, and effect the alteration had upon the dividends. Mentions the case of four railways running for a short time (in consequence of competition) at extremely low fares, and influence such reductions had upon the dividends. Doubts whether one of the companies would ever have recovered their expenses. These experiments not a fair trial of the low fare system. Amount of traffic between two places diminishes rapidly in proportion as the distance increases; 7362–7364. 7490–7496. No probability of proposed tariff being adopted under present system; quotes from Mr. Gladstone’s speech upon this subject; 7365. Reasons why it is desirable that the fixed effect of a low tariff should be ascertained, even though the railways were not purchased by the State; 7366–7368. Upon what lines and through what districts the experiments might be tried; Government should guarantee the companies against loss. Discussion upon the question as to whether it would be possible to find a line upon which the experiment could be fairly tried, in consequence of the lines being so intermixed with one another; 7369, 7370. 7469, 7470. 7573–7580. Would reduce annual and season tickets one-half of present average; 7373. Belgian railways belong to the State; their present financial position; 7374, 7375. Amount paid last year for passenger and goods traffic in the United Kingdom; 7376, 7377. In most cases charges for goods are excessively high; gives authorized charges for four classes of merchandise, and believes that in many cases they are enforced; the actual cost of conveyance is about 1s. 4d. per mile for 100 tons; 7378–7381. Rate at which coal brought from northern counties to London could be sold. In reality there can be no competition between railway and shipping; 7382–7384. High price of coal

GALT, WILLIAM, Esq.—*cont.*

prevents London manufacturers competing with those in the north; affects also the steamers that take in their supply in London or any of the southern ports; reads a letter from the firm of Harrington and Co., upon this subject; 7385, 7386. Gives annual supply of coal, and quantity carried by railway; 7387, 7388. Reduction for conveyance of merchandise should not be same as for passengers; principle which ought to govern the fixing of the rates; 7389, 7390. Considerable reduction should be made in parcel and package rates; should be uniform throughout the kingdom; question discussed; 7391–7395. If proposed rates were carried out public would pay about one-third of present prices; 7396, 7397. If railways belonged to the State, there would be a great improvement in postal matters; quotes a discussion which took place in the House of Commons in April last, upon the imperfect postal communication between certain places; 7398, 7399. Act of 1844 comes into operation on 1st January 1866; is not desirable or even possible to carry it out by compulsory means. Shareholders would be very glad to part with their property on good terms; are not satisfied with their present position. Dividends have improved within the last year or two; 7400–7407. 7413, 7414, 7440, 7441. Promoters of new lines have very great advantages over proprietors of old lines. No restriction upon State with regard to granting competing lines; 7408–7411. Course to be pursued if proprietors refuse to sell to Parliament; if consenting, how they should be paid; provision made in the Act for calculating the value of the property. Proper test of the value of a railway, what it brings in the market. Bonus that should be given to the shareholders; 7412–7419. 7442, 7443. Class of directors who would favour or oppose the carrying out of the Act. English people generally opposed to Government interference or to system pursued by continental Governments in such matters. The State should have the supervision of all railways; 7420–7424. Does not charge the directors with having abused the trust reposed in them by the Legislature, or with having broken faith with the public; thinks they are bound to do the best they can for their shareholders; 7425. Not much competition between the companies, but only a division of monopoly; difference between railway competition and competition between rival lines of steamers. Free trade in the construction of railways would not destroy the monopoly; 7426–7429. If the amount paid by the public to railway companies be about 36 millions, reducing the rates to one-third would be tantamount to a reduction of 24 millions in taxation. By guaranteeing a certain dividend to companies, inducements to economy and good management would be taken away. Profit that would accrue to State if Act were carried out; would make up any loss consequent upon reduction of rates. Large increase to national debt would not affect the national credit; 7430–7434. 7571, 7572. Reform proposed analogous to a certain extent to that of Post office; 7435. At present time country not prepared for such a change; how it could be brought about; thinks there is now an indication of a change; 7436–7439. 7568. Annual interest on purchase money of railway should be paid out of general taxation. All railway property should belong to the State, and leased to companies on certain conditions, the lessees paying the Government a rent equal to the interest paid, which would be about equal to the dividend now received by shareholders. If Government could not get anyone to lease them, they could be put in commission; how commission should be constituted; question discussed; 7443–7456. 7497–7511. Doubts whether the traffic of the great staples of the country would double or treble in any very short time. There should not be an absolute reduction in rates for merchandise, but that each case must be dealt with as necessity arises. Commission would make a reduction for the public good; 7473–7476. Travelling and everything else should be as cheap as possible; 7477, 7478. Thinks the poor man would be the greatest gainer by a reduction in the rates; 7512–7520. The company leasing the railway would be bound to keep up permanent way, rolling stock, &c., but State should undertake improvements and rebuilding of stations; 7521–7528. 7538, 7539. 7554–7556. Companies would expect to make a profit; 7529. Politics would have nothing to do with the letting of the lines. The highest bid should be taken, provided there was proper security. Railways have great patronage, but companies would be quite independent of the Government. Discussion as to whether Government would interfere for political purposes; 7529–7536. 7540–7552. Would be preferable to divide England into

GALT, WILLIAM, Esq.—*cont.*

four sections, as there would be very little competition if the whole were put up. The responsibility of each would be about eight millions. Lessees should have 5 per cent. allowed for profit. Does not think that the practical result of this would be that the saving in management would be absorbed in indemnifying the lessees; 7557–7567. If Government tried the experiment of low fares on the Blackwall railway, it would ruin the omnibuses, or if coals were brought at low fares from Newcastle, the collier trade would be destroyed; would be a hardship in each case, but does not think either should be recommended; 7581–7585. Has not considered the result of Mr. Gladstone's scheme upon further extensions; if it were fully carried out, would put an end to all private enterprise, but not to extensions. Mr. Gladstone contemplated a reduction to one-third of the average charges; 7586–7590. New lines should be constructed by new companies and afterwards bought by the State at a valuation; how value to be determined; 7591–7593.

Further examination.

Corrects former evidence wherein he assents to proposition "That if Government paid a bonus to the shareholders, the interest would be about equal to dividends they now receive;" his answer should have been "No, the profits would have been divided between shareholders and Government, the former having one-third, and the latter two-thirds;" gives an illustration; 8413, 8414. Discussion as to the correctness of Table No. 1, "average fares per 100 miles," wherein it is shown that lowest fares are demanded in Belgium, and highest in United Kingdom. Cannot dispute certain conclusions drawn by the Commissioners; is prepared to correct the table. Correction materially disturbs proportions previously given; 8415–8440. Taking into consideration that in Belgium very few return and excursion tickets, and no season tickets are granted, and a charge made for luggage when taken care of by administration, fares are rather less in this country; discussion thereupon; 8441–8463. Think answer to question 7632, given on previous examination, explains Table No. 6, which was made up to show that large deductions have been made in charges on certain important lines with very small diminution of dividends; 8464–8470. Has directed his attention to subject of Irish railways; their construction of more recent date than English ones. In 1837 a commission was appointed to investigate subject of railway construction in Ireland; made a report (popularly called Lieut. Drummond's report), recommending that Government should take steps for the purpose of having railways made there; reads an extract from the report; 8471–8474. In 1844 the first movement was made for their construction; the Great Southern and Western Railway Bill passed in that year, and in the following year Bills were passed for making the principal main trunk lines. States present financial condition of the Great Southern and Western Company; 8475–8477. Cause of management of fares not being popular in Ireland; are higher in Ireland than in England or Scotland; gives instances; 8478–8481. High fares materially affect public travelling; taking population into account, there is an enormous disproportion between number of people travelling in Ireland, as compared with England and Scotland. Reads a letter from a merchant in Coleraine, detailing certain grievances under which the people there labour, and suggesting certain rates for passengers; 8482–8486. 8532–8540. There are a great many independent lines, having separate managements; reasons why they do not amalgamate; 8487, 8488. Tried last summer to get up a feeling to carry out Act of 1844; 8489, 8490. Has prepared a detailed scheme for purchase of Irish railways; divides them into three classes, and states how each should be dealt with; discussion thereupon; loss, if any, should be made up by imposing a tax upon Ireland; 8491–8507. How the railways should be managed when Government acquired possession; 8508. 8517. States fundamental error of our railway system; gives an instance; 8509. Would be exceedingly desirable that benefit of system of low fares, and use of national credit, should be applied also to England and Scotland. Thinks if experiments were made on a few lines of very low fares, the result would be satisfactory. Fares might be advantageously reduced upon London and Blackwall, and Liverpool and Manchester lines. The former not supported by the poorer population; 8510–8513. 8527–8531. No injury in trying experiment first in Ireland. Should be allowed to adopt system there as an institution; as the people are willing to bear any loss. The greater benefit would be in large towns, such as

GALT, WILLIAM, Esq.—*cont.*

between Edinburgh and Glasgow, Liverpool and Manchester, &c.; 8514–8516, 8541–8543, 8566–8569. There might be a loss for two or three years, but that revenue would recover itself; 8517. Experiments could only be made by Government taking whole of Irish lines. There is no line that does not more than pay its working expenses; 8519–8526. Present high rates prevents full development of the mineral resources of Ireland. Copper from mines of Wicklow and Waterford is carted alongside the railway. Cattle are driven along the roads instead of being carried by railway; 8544–8556. Must be an Act passed compelling companies to sell the railways upon certain conditions. Should be a uniform tariff for passengers, and for goods a tariff according to necessities of each case. Reason why witness does not think that if railways were under Government management, there would be any difficulty from the different interests of the several parts being brought to bear upon the Government; 8557–8565, 8571–8574.

GRIERSON, JAMES, Esq. (*Analysis of his Evidence.*)

Has been for last two years general manager of the Great Western Railway Company; was formerly goods manager; 5905, 5906. Nature of through-booking arrangements made by company with Waterford and Limerick Company. Most important traffic between the two places. Traffic between Waterford and Bristol, but no through-booking arrangements *via* Bristol to Waterford; 5907–5912. Waterford traffic comes to Milford Haven. Arrangement with Waterford and Limerick Company satisfactory. If through-booking carried on *via* Dublin it should also be carried on *via* Waterford, and to all parts of south of Ireland. Great Southern and Western refused to give through-booking arrangements; 5913–5917. Waterford and Limerick do not charge as part of through-booking rate a local rate; are negotiating with the Great Western Company in order to obtain some better arrangement. Deposited a Bill in Parliament this session with a view of bringing about a closer connexion between Great Western and their line. Great Western have decided to take no part in the matter; 5918–5921, 5924. Has traffic for passengers and goods on Waterford and Limerick Railway, but former not large, the boats being unsuitable; 5922, 5923. Would be advantageous to Great Western Company to have control over Irish railways so as to get all the through traffic over their system. Their interest to work lines so as best to develop traffic; 5925–5928. If Irish railways amalgamated, could be worked efficiently as one line. If Great Western Company leased lines, would give further facilities for through traffic. Rates from Waterford to Limerick very low; could not say whether company would lower rates; most desirable when there is a prospect of increase of traffic; 5929–5934. Amount of income guaranteed to Waterford Company in addition to proportion of mileage rate. Large traffic in bacon and butter, and in cattle, horses, and pigs, but not in passengers. If better boats were put on, Milford to a certain extent might compete with Holyhead; 5935–5944. A project entertained some years ago to establish in North Wales a rival port to Holyhead. Great Western Company have obtained an Act to make a line to Fishguard; intended by independent parties to make a harbour there and run boats to Wexford; will be able to compete with route to Holyhead, the distance being rather less. Act obtained last year to make a railway on Irish side of channel to Roslea; 5945–5949. If all the Irish railways were amalgamated under one company it would require strong clauses to be framed to prevent concentrating all the traffic to one Irish port to injury of others. Might not always be best to take traffic by shortest route; 5950–5954. Places to which company has through-booking arrangements, and natural routes of those places; 5955–5964. An equitable arrangement might perhaps be made by striking a line across England and allowing Dublin to have all the traffic north of it and Waterford all south. Such an arrangement was made by Great Western and Midland Companies. It might be considered equivalent to closing up one route in each direction for the benefit of a particular port, and for the benefit of the two companies. Would work well in the interests of the public. Would be so far disadvantageous as it would enable railway companies to charge high rates, and up to maximum fares. At present all traffic brought to any local station goes by route favoured by company. Great Western Company desire that traffic should take its natural route; there are four points with which they interchange traffic with Ireland. Same rate to same place *via* Holyhead or Milford. Only book through to Cork *via* Bristol, cheaper route when time is no object. Nothing to prevent booking through

GRIERSON, JAMES, Esq.—*cont.*

between Bristol and Waterford; 5965-5977. Witness explains arrangement entered into with certain companies, whereby it is agreed that certain portions of traffic shall be considered as going *via* Waterford, and other portions *via* Dublin; discussion thereupon. Amount of rebate paid to Messrs. Malcolmsen. Arrangement prejudices trade of port of Waterford, but benefits Great Southern and Western Company; 5978-5992. Receives Irish traffic at Liverpool; expects that all the traffic from north of Ireland will be done through Birkenhead; Great Western do not contemplate putting on steamers to Birkenhead; 5993-5995. Reasons why it is desirable that all the Irish railways should be amalgamated into one. When amalgamation took place between Great Western and West Midland companies, a large additional traffic sprung up, and though rates were considerably reduced; increase of traffic more than compensated for the reduction, and greatly benefited the public. Adoption of similar arrangements in Ireland would lead to similar results. There would be a reduction in working expenses and general charges, and considerable economy in material, if all the railways in Ireland were amalgamated. Arrangement between Great Western and Vale of Neath Companies; reduced coal rate to London to about 1s. 5d. per ton; traffic 20 per cent. higher than it was; does not entirely arise from reduction; 5996-6007. The fewer separate railways in Ireland the better for the country. If nothing can be urged against Irish railways being put into one system, should not be put into two or three. Total mileage of Ireland about same as London and North-western and Great Western. Mileage of some of the French systems much more. Irish train mileage much less than on such a line as London and North-western; 6008-6015. One board could develop traffic in Ireland satisfactorily. Frequent complaints that local traffic has been neglected, but has never known a case authenticated. As far as possible members of railway boards in England are selected to represent different local interests. Local traffic of every railway most important; if directors of Irish railways consulted their interests they would cultivate it. How such traffic could be looked after; 6016-6023. Other things being equal, one extensive system can be better worked than a number of small systems. Mentions undesirable way in which Irish lines are worked, and traffic diverted. If railway in the hands of one company, should be prevented from falling into same error. Should not be tied up so as to avoid local connexions and influence, as a local director is often of great value to a company; but directors should look to general rather than to individual interests; 6024-6031. Thinks Irish railways are in good condition; rolling stock not so good as on best English lines; permanent way, with one exception, in good order; trains seem punctual; 6032-6036. English companies would have no objection to amalgamation of Irish lines if company entirely independent of existing English companies, or directors in it to represent them; 6037, 6038. Working of railways not much cheaper in Ireland than in England; circumstances which tell against them; 6039-6043. Amalgamation or absorption of small lines into large ones has, as far as Great Western is concerned, had the effect of raising rates of wages; higher wages are given with a view of getting a better class of men; this is the best economy; 6044-6053. Large railways have a town and country rate of wages; same under similar circumstances; how men are promoted; 6054-6056.

HANCOCK, W. NEILSON, Esq., LL.D. (*Analysis of his Evidence.*)

Was formerly professor of political economy in the University of Dublin, and professor of political economy and jurisprudence in Queen's College, Belfast; 7594. Has been engaged in collecting statistics on various questions relating to Ireland; 7595. Has directed his attention to Irish railways; describes their financial condition, and mentions those companies that do not pay all their dividends on their preference shares, those that do not pay on their ordinary shares, those that pay a dividend less than the rate of interest in the funds, and those that pay more than the funds, but less than what the shareholders believe to be true commercial interest; gives also the mileage of each class. Dublin and Kingstown Railway shares at a premium; is leased to the Wicklow Company on a perpetual lease; 7596-7604. Coincides with proposition stated by a Committee of the House of Lords in 1864, that where companies were not able to pay their ordinary shareholders, they were not in a satisfactory condition for developing traffic, or to work the thing successfully; describes how

HANCOCK, W. NEILSON, Esq.—*cont.*

the public interests are affected by such a state of things; quotes from the report showing that the commercial system breaks down where there is not commercial profit; 7605-7607. 7749-7753. Gives an instance where the shareholders suffered a serious loss; 7608, 7609. Thinks one cause of lines not paying is that solvent companies are afraid of carrying out extensions; these are then taken up by speculative companies, who pay their contractors in shares; reasons why it is objectionable to pay contractors or landowners in shares; discussion; 7610-7615. No line should be commenced unless it is a *bond fide* commercial company, and has its capital subscribed; if such is not the case shareholders will most likely suffer loss; 7616-7622. Attributes present state of things in Ireland to many lines having been made which never had a prospect of yielding a remunerative return; 7623-7625. County roads in Ireland are made out of local taxation; 7626. Railway defects in Ireland cannot be remedied by competition; mentions a case where it was injurious to the company, though beneficial to the public. Is in favour of competition; names several competing lines in Ireland; competition generally ends in a compromise. Effects of competition diminished where number of competitors restricted; not possible as a permanent arrangement; 7627-7631. 7704-7708. States why amalgamations go on very slowly in Ireland. Certain non-paying dividend lines may nevertheless represent a commercial value. If there were a general amalgamation of railways, and whole traffic worked on uniform plan like the Post Office, a much larger sum would be made, but scheme would create dissatisfaction in the different counties. Would be a great jealousy if any large portion of Irish lines were amalgamated with English companies; 7632-7636. 7700-7703. Present state of money market will put a stop even to legitimate extensions; 7637, 7638. Unprofitable condition of Irish railways not attributable to state of the country; since 1862 the country has steadily improved; 7639. Takes a hopeful view of the future prospects of railway traffic in Ireland; reasons for so doing. Railway returns much better this year than last. Dublin exhibition has of course made a difference; 7640-7642. 7756-7760. Emigration has not affected the traffic, as wages having increased, the people have been enabled to travel more; 7643. Gives two reasons why the coal traffic will increase; varies much in different years; 7644, 7645. Proposes that bankrupt lines and lines that have been stopped should be taken by the Government, provided that the traffic would pay cost of completing them, reckoning the money to be advanced at 3½ per cent. If the traffic would not pay at that rate, and localities would not guarantee portion of cost to make up that amount, the Government should not interfere, as no part of loss should be borne by national exchequer. If traffic produced more than enough to pay Government, residue should go to proprietors to make good money expended before Government took possession. Discussion as to when the Government should take possession; 7646-7661. 7709-7711. Lines which pay no dividends, either on preference or ordinary shares, should have the traffic valued, and purchased by the Government at 3½ per cent.; 7662-7664. Would not interfere with lines paying less than the funds or with those paying above unless the companies were desirous of selling; 7665-7667. How traffic should be carried on, and extensions and new lines made, when possession was taken by Government; in all cases they should control the rates; 7668-7670. 7729-7731. Does not think traffic would rapidly increase if fares were reduced; reason why it would be better to try experiment on those lines purchased by Government; 7671-7674. Experiment should be tried by reducing third-class passengers' rates, but not below the actual cost of conveyance; 7675, 7676. Calculation as to how to get maximum net receipts out of railway when purchased. Fixing such a rate as will induce people to travel will pay best in the long run. If Government advanced the money to make the railway, fares should be regulated so as to pay the interest. If they purchased a railway for 100,000*l.* which cost 500,000*l.* fares should pay part of interest on the sum actually paid; discussion thereupon; 7677-7696. Unlimited nature of liability in case of accidents one impediment to reduction of rates. Should be a fixed sum for each class of passengers. In Ireland proportion that sums paid for compensation bear to passenger receipts small. In some instances it has materially affected the dividends; 7697-7699. If Government became the proprietors of all the railways, they should work them like the Post Office, appoint certain of the officers, and fix fares; believes that under such an arrangement there would be the necessary vigilance to seek and promote traffic in the

HANCOCK, W. NEILSON, ESQ.—*cont.*

highest degree. Is not aware that the Irish Post Office does not pay; 7712-7721. Should not necessarily be one uniform rate of charge over line everywhere; does not know whether such a plan would create dissatisfaction; 7722, 7723. Discussion as to whether political influence would be brought to bear in particular localities in order to reduce the rates; might be neutralized by making parties in that district bear any loss from such a reduction; 7724-7728, 7737-7739. Gives a speculative opinion that where lines are not paying a commercial interest they are not well administered by the directors; 7732-7736. Shareholders of lines paying a very moderate rate of dividend averse to speculation; 7740, 7741. Solvent lines are well managed in Ireland; interest of directors to keep them in good repair; 7742-7744. Government would be better fitted to judge what would ultimately be profitable to lines than individual shareholders. Thinks they would not be too rash. Government establishments in England are managed as prudently as some public companies; 7745-7748. Government would not be under a disadvantage in having to make the experiment on bankrupt railways, as if they were bought at a price that the traffic would warrant they would be no longer bankrupt; 7754, 7755. Mentions several of the bankrupt railways which the Government should first take; discussion as to whether it would not be advantageous to amalgamate some of these lines, and work them in connexion with the Great Southern and Western Railway. Where lines are in the hands of preference shareholders they would be opposed to amalgamation; 7761-7766. Discussion as to whether one reason of railways not amalgamating in Ireland is because almost all are connected with special seaports, and also whether the making of unprofitable lines are of benefit to the public; 7767-7782.

HAUGHTON, WILLIAM, ESQ. (*Analysis of his Evidence.*)

Was deputy chairman for several years, and chairman since 1860, of the Great Southern and Western Railway of Ireland, and member of the board since opening of the railway; 4473-4475. Question frequently before board whether measures could be adopted to make railway more profitable. A reduction of rates would be too hazardous an experiment; 4476-4479. Railway running through an agricultural district, the increase of passengers following a reduction of fares would not make up deficiency in receipts. In England low fares in such districts do not produce any considerable increase in traffic; 4480-4482. Only change of fares since opening of railway was an advance of 10 per cent. about nine years ago on first and second class. Cannot say whether change was satisfactory to company; 4483-4488. Third-class traffic large. No special facilities to passengers on market days. Frequently run excursion trains at low fares, to which third-class carriages are always attached; 4489-4492. Hands in tables showing places between which excursion trains are run, times at which portions of the railway were opened, and receipts to present time. When communication effected with Cork, traffic decreased; discussion thereon; 4493-4510. Local traffic very small. Hands in a return showing goods traffic between certain stations for years 1856-1858; quotes receipts between Hazlehead and Carlow; discussion as to great increase in goods traffic between Tullamore and Cork in those years. Has no similar return as to passenger traffic; very little between second-rate towns and generally from one to the other. Considerable traffic between Limerick and Dublin; 4511-4520. 4580-4584. Competed for two years with Grand Canal Company. Hands in a table showing between what towns the competition existed, and that upon reduction of rates for grain and flour from 7s. 6d. to 2s. the tonnage considerably increased and receipts decreased. Revenue paid working expenses. Quotes dividend paid since opening. Raised rates and came to terms with Grand Canal Company. Traffic fallen off along line of canal. Has not tried any experiment since; 4521-4530. 4585. Gives passenger fares, and states that whilst traffic of first and second-class passengers from 1860 to 1864 remained almost stationary, the third-class traffic considerably increased; 4531-4538. Great increase of coal traffic in 1860 as compared with 1859; attributable to scarcity of turf; has always been an increasing traffic; 4539-4542. Railway charges 1d. per ton per mile without terminals, and provides the waggons. More coals are carried from Cork than from Dublin. Thinks it hopeless to expect a traffic for the consumption of the poor; 4543-4547; Railway communicates direct with shipping at Cork. Coals, but not ordinary goods, can be put at once in the trucks; 4548, 4549. Mentions with what English com-

HAUGHTON, WILLIAM, ESQ.—*cont.*

panies railway has through booking arrangements. How terminals are arranged between companies; are not charged to public; 4550-4562. The cartage is undertaken by Mr. Fishbourne, who acts in Dublin as Messrs. Pickford do in London; the railway company settles with the shippers of the goods; it is an additional expense of 2s. per ton. From Cork to Dublin it is 2s. 6d. a ton for goods; 4563-4569. Special rates have frequently been given to individuals, but in no case has quantity promised been sent; instance cited. The ordinary rates are published; vary according to distances; same inwards as outwards; 4573-4579. Repeated proposals to amalgamate Great Southern and Western with Waterford and Limerick; negotiations came to nothing. Amalgamation only a question of time. Great Southern and Western are absorbing small lines; these were made cheaply and well. Difficult to get lines of railway for their value unless Government interfered; 4586-4590. Public suffer inconvenience from small lines not being amalgamated with large ones, there being no through rate. Complaint against Great Southern and Western that third-class passengers cannot conveniently go and return same day. Reasons against issue of third-class return tickets. Has not tried them for market days; 4591-4595. Cattle traffic increasing until last year or two. Store cattle are not driven along the road for long distances. Number of trucks of cattle carried at Ballinasloe fair; has no branch there. Tried cheap rates for cattle for a year in opposition to Midland Company, but it was a failure; 4596-4600. There are several small railway companies within Great Southern and Western district, which are not amalgamated, and which do not work over by agreement; are no hindrance to traffic; run trains in concert, and work amicably with them. Great Southern and Western system complete throughout all the district; 4601-4605. If Waterford and Limerick were in their hands, communication between Limerick and Dublin would be more conveniently worked; through trains would then be run to Limerick. Inconvenience felt by public in consequence of not being able to return from Dublin same day; 4606, 4607. Received a proposal to send minerals, but it was found that traffic would not pay half working expenses. Gives rates offered, and distance it would have travelled over line. No fixed quantity promised. Traffic to be remunerative must be continuous; 4608-4616. Traffic in south of Ireland, so far as the Great Southern and Western are concerned, is fully developed. Thinks there would be a slight increase of traffic if rates were reduced. Corrects a statement made by Mr. Longfield; 4617-4620. Some of the minor lines are in a state of bankruptcy; this is owing to having cost too much, or to insufficiency of traffic; instances the Wexford and Bagnalstown line; 4621-4623. 4625, 4626. Thinks Ireland is in a poor condition; cannot expect any great increase in passenger traffic; 4624. Has no new railway projects before Parliament; mentions some bills that have been passed; never opposed any lines; 4627-4629. Outstanding bonds. How debentures on Government loan were paid off; 4630-4634. Rented a line to Cork with the intention of purchasing it; has a large passenger traffic, but no goods traffic, because there are either no stations or very badly constructed ones. There would not be much traffic if stations were good. Cheaper to send by lighters to port of Cork. Explains how the trade is carried on; discussion thereon. Large grain traffic between Dublin and Cork, which goes principally by sea; reasons why railway cannot compete with the sea; gives rate by sea and distance by railway; 4636-4642, 4647-4654. Grand canal has an advantage over railway. Railway company take all orders they can get; 4643-4646. Explains why railway cannot carry grain; 4655-4664. If there were a large and continuous quantity of grain, 6s. per ton would pay, but rates to Cork now very low, in order to compete with water communication; 4665-4671. Thinks that no measure in connexion with railways could stimulate industry of Ireland, unless Government is prepared to risk a large sum of money. Public expectation in Ireland; 4672, 4673. Would not recommend to proprietors any reduction of rate as it would reduce dividend. Cannot imagine any number of years in which deficiency would be made up; 4675-4678. Low fares on Great Southern and Western have never had a fair trial. Difficulty as to trying a reduction on part of a line. A reduction of fares would not be followed by a great increase of traffic, as there is nothing to induce travelling from town to town in Ireland; 4679-4682. New lines in progress in south of Ireland; others projected; declines to give an opinion as to motive for promoting new lines when old ones unremune-

HAUGHTON, WILLIAM, ESQ.—*cont.*

native; 4683-4685. Great passenger traffic to Killarney in summer time, though less than might be expected. The large hotel there, although terms reasonable, does not pay; 4686-4688. Gives quantity of butter sent between Cork and Dublin, and rates charged, also passenger fares between Cork and Limerick, Cork and Killarney, and Dublin to Kilkenny, and distances. Does not consider that many passengers are carried through to Killarney from London and North-western system; 4689-4694. Reasons why he thinks it doubtful whether there would be competition between Wexford and Dublin if a line were made to Waterford and Wexford; 4698-4701. Desirable that London and south of Ireland should be connected together; 4702, 4703. There would be no material saving in working expenses effected by amalgamation, the advantage would be greater convenience to the public; 4704-4711. All the engines and carriages are repaired in Dublin and Cork; does not repair those of other companies; 4712-4714. Within certain limits increase of passenger traffic might be worked without increasing rolling stock; 4715. Many lines are irretrievably ruined, as far as regards the public advantage, in the course of 10 or 15 years, and some of them in half that time, the rails and sleepers will have to be renewed. There is not a single line in south of Ireland whose capital is not irretrievably gone unless traffic of the country increases; 4716-4720. Corrects a mistake made by a previous witness as to saving effected in rate for coal by bringing railway in Dublin down to water side; 4721-4723. Majority of directors think that no reduction of rates could be made without ultimate loss; 4724-4726. Majority of shareholders Irish. The railway meetings are always in Dublin; 4727, 4728. Has a considerable fish traffic; it is carried in goods vans attached to passenger trains; is not an increasing traffic; goes principally to England. Gives through rates to England per cwt.; 4729-4733.

HEMANS, GEORGE WILLOUGHBY, ESQ. (*Analysis of his Evidence.*)

Is a civil engineer, and has been for 25 years engaged in construction of railways in Ireland. Enumerates the lines; 3760-3762. Irish gauge an impediment to working lines economically. Advantages of traffic as great as in England. Carriages accommodate four abreast, same as on English narrow gauge, although much heavier. An advantage in constructing locomotives; 3764-3766. 3780, 3781. English narrow gauge preferable. Impossible now to alter Irish gauge; 3767-3769. Expense of working greater, increased by cost of coal and dead weights. Rolling stock also dearer. Cost of running a train per mile not quite so much in Ireland as in England. Irish gauge does not make much difference in the construction of a line; 3770-3775. Cost of carrying a given number of passengers or goods rather greater upon an Irish than upon an English railway. If carriages were filled the working expenses would still be heavier in proportion to number of persons carried; 3776-3781. Few night trains diminishes cost of keeping up lines, wages, &c. being less. Cost of keeping up permanent way less in Ireland than in England. Goods trains are run at night; 3782-3788. In comparing working expenses on English with those on Irish lines not fair to take the English great lines, but branch lines made through thinly-peopled rural districts; 3789. On Sundays a train is run morning and evening. Sunday trains do not pay on long lines; 3790, 3791. Gross traffic receipts on Irish lines appear stationary; 3792, 3793, 3827. A few years since hopes were entertained, which have not been realized, that there would be more prosperity in Irish lines; many railways were started, the contractors being paid principally in shares, thus throwing an immense amount of debt upon the lines; found extremely difficult to get contractors to take up the work upon these terms; discussion as to amount of money wasted; 3794-3811. Goods traffic has diminished, cause; 3812-3816. If rates were lower there would be more cattle traffic: grass-fed cattle are frequently walked 20 or 30 miles; 3817, 3818. If rates were reduced one-half there would be a temporary loss, but thinks in five or six years the present net revenue would be realized. Comparative cost of working lines proportionately less as carriages are better filled; at present they would take 50 per cent. more third-class passengers; 3819-3825. Dividends have decreased, reduction in some cases attributable to expense of renewing permanent way; 3826, 3828, 3829. Is of opinion that steamboat traffic across Irish channel is not in a satisfactory state; 3830. Amalgamation of small boards with larger companies would reduce fixed

HEMANS, GEORGE WILLOUGHBY, ESQ.—*cont.*

charge in favour of proprietors; small boards often act in an obstructive manner; 3831, 3832. Discussion as to how Ireland should be divided into districts in the event of amalgamation of railways; 3833-3839. States cause of nonpayment of dividend in some railways and reduction in others; 3840-3848. Points out how saving would be effected by amalgamation, discussion thereupon; 3849-3856. Gives reasons why he thinks no favour would be shown by railway companies either to amalgamation or purchasing lines. Holders of stock would be glad of any measure that would ensure them a modest dividend. Thinks when shareholders opposed amalgamation they must have been influenced by the directors; 3857-3860. Amalgamation, with protection from monopoly, and a large reduction in the rates, would be popular with shippers of goods and cattle; how temporary loss could be met. Barony rate could not be put on; illustration; 3861-3869. 3871-3874. 3899-3902. Landholders and agriculturists derive considerable advantage from construction of railways. Would not agree to bear temporary loss; general feeling that it should be borne by United Kingdom; under such arrangement $\frac{2}{3}$ ths would be raised by Great Britain. Irish railways pay no passenger duty; 3870, 3875-3884. Some method should be devised of trying the experiment of reducing fares without sustaining a loss. Conditions upon which a guarantee fund might be raised; 3885-3887. Reasons why directors in Ireland object to amalgamations. Amalgamations numerous in England; 3888-3892. If Irish railways were amalgamated, and the country divided into three systems, thinks it would not be possible that working could be satisfactorily carried on by a few boards unless Government appointed a referee who should have full power to do justice to every line; 3893, 3894. Whole system could be vested in hands of one or two companies. Dublin should be the chief centre of railways, and at Belfast there should be another centre; 3897, 3898. Has not estimated what the effect would be of reducing rates 50 per cent.; thinks traffic would come gradually; at the end of 10 years the loss would probably recoup itself. After a time third-class passengers would use railway, second-class passengers would be induced to travel first class, to those who now travel first class the reduction would not be material; 3903-3911. Does not think third class would use railway unless fares were reduced one half; 3912. Increase of passengers would not add to working expenses, but until traffic doubled there would be a diminution in gross receipts; 3913-3916. Low charges will tend to gradual establishment of manufactories in Ireland, but merely as an agricultural country it would pay to reduce rates; 3917, 3918. In England low fares have led to considerable increase in passengers in agricultural districts. Want of money prevents Irish people using railways; 3919, 3920. Introduction of coal into centre of the country becomes more important every year. Has observed a tendency to discontinue use of turf. If coal was cheaper, and the empty cattle trucks returned laden with same, the consumption would increase; 3921, 3922. If railway companies make a large reduction in cattle rates, and bring back coal from Dublin for $\frac{1}{2}$ d. a ton per mile in the same trucks, it would pay in the end; 3923. Cannot tell the net receipts on Irish railways, or amount of capital invested; 3924, 3925. Turf cannot be used so economically for steam engines as coal; all attempts to compress turf into a small compass have commercially failed; three times the bulk of coke or coal. By the time good turf is dug, dried, kept, and sent to market it is not a cheap article; only burned on railways to light the fires; is possible, if you get an engine established near a peat bog, to drive it with turf at a low rate; 3926-3932. Flax mills and cloth and woollen manufactories would be established if rates were reduced. Manufactories in England have been established near to where fuel is produced. A good deal of water power would come in aid of Irish manufactories; where there is large water power and auxiliary steam it ought to be able to compete with steam power. Thinks manufacturers in Ireland using water power could compete with English manufacturers using steam power; 3933-3937. One engine would not take more than 210 tons of coal. Gradients are equal if not superior to many of the leading lines in England; gives them upon certain lines; 3938-3948. Putting on powerful steamers by railway companies in connexion with Irish ports would be beneficial. The London and North-western is the only company that has power to expend capital in that way, and they had considerable difficulty in getting sanction of Parliament; 3949-3954. Railway companies participate in property of steamboats between Fleetwood and Belfast

HEMANS, GEORGE WILLOUGHBY, ESQ.—*cont.*

and between Morecambe and Belfast. Not so well managed as they would be in the hands of railway companies; 3955, 3956. If Great Western Company had power to put on steamers between Waterford and Milford, the service would be better. Does not know if they applied to Parliament for power to put on steamers; general impression that it is difficult to obtain such power. Shareholders can stop companies from embarking in such undertakings; 3957, 3958, 3985, 3986. Would introduce competition between railways and independent steam ship companies; private companies must either improve their accommodation or succumb. The Waterford Company, with their numerous fleet of steamers, and also the Dublin Company, would be able to hold their own against any railway companies' boats. Places to which Waterford Steam Company ply; 3959-3967, 3983, 3984. Not sufficient sea service between Waterford and Bristol, 3967, 3968. An efficient service similar to that which exists between Holyhead and Dublin would stimulate the export trade all over the country, 3969-3982. Would make steamboats between English and Irish ports a combination between English and Irish railways, so as to work together; 3970. In some cases it might be advantageous to lease Irish railways to English. Irish goods should be booked through in every direction to England; 3971. English companies should be able to put on steamers in connexion with Irish railways, so as not to give an exclusive monopoly to any one line; 3972. Might be profitable for a railway company to put on steamers when it would not pay a private company. Is not aware of any difficulty in the way of through rates between Waterford and Wales; 3973, 3974. Places where it would be advantageous to establish steamers in connexion with railways where they do not exist, or are insufficient; discussion thereon; 3975-3981, 3989-3992, 3994. Difficulties in way of companies indirectly establishing boat communication; 3993. Thinks Midland Company are only interested in the boats from Morecambe to Belfast; 3995, 3996. Would establish a system of through booking from every port in Ireland to every port in England. There is booking through Dublin and may be some in the north, there is some also by Waterford, but service is not good; 3997-3999. Passage from south of Ireland to Fishguard; 4000, 4001. Compares difference in point of time and distance, supposing there was a good sea service between Waterford and Milford, of a journey from London to south of Ireland with route by Holyhead and Dublin; 4002-4006. Could hardly expect boats of equal power and speed to those running between Kingston and Holyhead; 4007-4010.

HILL, FREDERIC, ESQ. (*Analysis of his Evidence.*)

Has been for the last 14 years assistant secretary to the Post Office; 7933, 7934. His attention has been directed to questions of railway management and legislation; 7935-7937. Explains difficulties in obtaining postal facilities, and the tendency on the part of arbitrators, if matters are referred to arbitration; 7938-7943. Not obtaining reasonable terms very much diminishes use of railways. In Belgium and France a more frequent communication between town and town than in England. In France, unless special trains are required, State pays nothing for transmission of letters by railways; 7944, 7949, 7950. In some cases cheaper to send mail by horse and cart; 7945, 7946. Has to pay more where trains are required to be run at certain hours; 7947, 7948, 8091, 8092. Parliament might compel new lines to carry the mails gratuitously; thinks service would be better performed by paying companies a remunerative price; 7952-7955. Difficulties in the way of Post Office availing itself of ordinary trains; mentions an instance where it had to pay very highly for sending a very light mail; 7956-7961. Impossible to substitute a fixed invariable payment for system of separate arrangement. In the case of new railways, a mail tariff, varying according to certain circumstances, might be introduced into the Act. Post Office have frequently represented to the Treasury the want of such a measure, and some years ago a Bill was prepared, giving Post Office power of sending mails at certain fixed charges, but in consequence of an intimation of a very strong opposition, the Bill was not proceeded with; 7962-7986. Desirable that State should become the proprietor of the railways; should not be purchased; a fixed dividend should be guaranteed to the shareholders, the risk (if any) should fall upon the State. Reason why witness thinks there would be no loss; the Government will gain other advantages. Such a price must be offered as would induce shareholders voluntarily to surrender their in-

HILL, FREDERIC, ESQ.—*cont.*

terests. Power should be given to the majority to bind the whole; 7987-8001, 8026-8028. Would put up line to competition, and let each railway upon lease, imposing certain conditions as to rates, &c.; permanent way should be left to leasing company; 8002-8005. Should be frequent inspection of line; 8006. Believes the rent would cover payments for debentures, and for ordinary shares. As the debentures fell in, Government would be able to re-issue them on much more favourable terms; 8007-8010. Would be desirable to create a special small department for managing the railways. Government should buy them up gradually; 8011, 8012. If purchase by voluntary means only, does not follow that Government would become possessed of all the worthless lines, as they need not purchase unless they thought proper. Proprietors of improving railways would be willing to part with them at a given price. For what cases compulsory powers should be obtained; 8013-8017, 8097-8099. If Parliament thought any new line would benefit the country, they should sanction its construction; if it should be an injury to companies having a 21 or 30 years' lease, lessees would have claim to have rent re-considered; 8018-8022, 8036-8038. By witness's system the State and the proprietors would both gain; 8023-8025. In what way saving would be effected if State purchased the railways; 8029-8035. Thinks force of competition between those offering themselves as lessees would bring about a large reduction of the fares. Under present system effective railway competition impossible; 8039-8041. Puts in paper headed "Summary of opinions held on the subject of railways;" 8042. No essential difference between an annuity payable to a body of railway proprietors, and one payable to ordinary holders of consols; effect that Government borrowing money or paying annuities at higher rates of interest would have upon consols. Discussion upon the creation of these annuities; 8043-8067. No term of lease should be fixed. How packet tenders are framed. Thinks there is an analogy between entering into a contract for the conveyance of mails, and one for the entire use of a railway; discussion thereupon; 8068-8079, 8190, 8191. Lessees should have power to select their own officers, even though the railway were only let for one year; 8080-8082. Government should prescribe the trains to be run, but should reserve to themselves the power of preventing lessees of one railway throwing unnecessary obstacles in the way of the working of an adjoining one; 8083-8090, 8093. Would lease out each separate line as it was surrendered. Thinks that all the railways will gradually become the property of the State; 8094-8096. Believes lessees would be men of more administrative ability than present boards of directors. Has observed a tendency recently of private enterprise changing to joint stock companies; in many cases boards of directors of such companies will manage better than boards of railway companies; mentions the cases of Mudie's Library and Dillon and Co., where the existing management has been retained, and become the nucleus of the company; 8100-8110. If a particular railway were ably managed, lessees would be glad to retain manager. Very probable that managers themselves would become lessees, provided they could give security that terms of lease would be acted upon; discussion as to the security that should be required; 8111-8123, 8131. Would not allow lessee any per-centage upon his rent for profit and risk; 8124-8130. Upon termination of lease, or at any intermediate time, if either party desire it, the whole property should be assessed, and any falling off made good by a money payment. How to guard against insolvent companies undertaking a lease. Lowest tender not the only thing to be considered. Thinks political bias would not influence the contracts; not the case in Belgium and France; 8132-8143. Advantages that would arise if Government were to take possession of the railways. Is not for the advantage of the public to make as many railways as can be made; cases in which competing lines are an advantage, and the reverse; mentions two instances in which lines have been unnecessarily multiplied; discussion as to whether such lines should be sanctioned by Parliament; 8144-8177. Great difference in the railway communication if State had purchased the railways 20 years ago; 8178. Discusses question as to whether it would be expedient to have one line for passengers and another for goods; 8179-8189. Power of lessee to make engagements with third parties would cease with his own term; all engagements extending beyond must have the sanction of Government; 8192-8196. Reasons why securities against accidents, assaults, robberies, want of punctuality, and irregularities should be provided for in the

HILL, FREDERIC, ESQ.—*cont.*

terms of the lease and not by Act of Parliament; 8197–8209. Amount paid to vessels carrying mails depends upon the penalties imposed; 8210–8214. Adjusting the working of different railways so as to make trains of every line coincide at terminal points with those of neighbouring lines would be done better in a lease than by Act of Parliament. Believes that in many cases the want of correspondence is intentional; 8211–8220. Government might find it beneficial to have only one gauge; would have to pay for the alteration, but if traffic largely increased it would tell upon the rent. Could not be altered without Government interference. Broad gauge only exists in a very limited district. If profitable to Government to change gauge, not necessarily so to Great Western Company. Mixed gauge upon that line must be very inconvenient; 8221–8231. Question whether it is sound commercial policy for State to purchase railway property at more than its market value; 8232–8240. Would propose a moderate tariff for the conveyance of the mails, reserving the power as now of requiring trains at certain times and at a certain speed; 8241–8245. Post Office worked at considerable profit. Can have every facility by paying for it. Under a lease very much greater facilities could be obtained for a moderate additional payment. Post Office makes a profit in spite of railway system; would not greatly exceed its means if there were no railways. Pays more per ton per mile than was paid formerly to old coach proprietors; work is done now cheaper by stage coach and mail carts than by railways; 8246–8253. If scheme carried out there would be greater competition between railways and canals; might seriously injure the proprietors. Discussion as to whether this would not be a great hardship. Government would take over every collateral obligation which railways would be under with respect to the canals; 8254–8262. Is not aware that in Austria and Italy the Governments have sold all the railways; not bound to follow their example. The French Government have not sold theirs; 8263–8267.

JONES, WILLIAM BENCE, ESQ. (*Analysis of his Evidence.*)

Is a landed proprietor in the county of Cork; has resided there more than 20 years; 6461, 6462. Whole of traffic of West Riding of county of Cork, with a small exception in the northern part, depends upon one line of communication; main line of communication from Cork to Bandon; 6463, 6464, 6505. When line opened. Cost per mile. Difficulties before railway was opened. At first taken up by preference shareholders; is now managed by first preference shareholders. Mentions directors' names, and where resident. Not necessarily required to hold original shares; 6465–6470. First preference shareholders have always received their dividend, but second not so regularly. Amount of loan capital, and interest paid. How much represented by first and second preference shares, and by original shares. Original shareholders have received nothing since line opened. Market value of these shares; 6471–6476, 6489. Bandon district capable of producing a considerable quantity of traffic. Amount earned by railway. If fares were lowered, it would be beneficial to the public, but cannot say whether it would be profitable to company; 6476–6479. Real difficulty is that present managers of railway being interested only in preference capital, upon which they receive a dividend, have no interest in developing traffic. Were company solvent, would promote extensions; all traffic from extensions must pass over the line. Company do not stand in the way of extensions, but cannot promote them for want of money. An extension partly finished, called West Cork Railway. Describes the favourable nature of the country for making this railway. Originally intended to go to Skibbereen (32 miles). Completed 17½ miles out of 18, and was obliged to stop for want of money. Has applied to Parliament for power to raise more. Line will cost considerably over 20,000*l.* per mile; engineer estimated that it could be done for 4,000*l.* Enormous increase of cost caused by there being only 10,000*l.* embarked in it. Whole done by taking shares into the market and getting rid of them at any price. Everybody, except labourers, paid in shares. Tried to get a *bonâ fide* contractor, but failed; got into the hands of people who carried on lines on credit; 6480–6488. Does not think the Cork and Bandon Company can be in arrear to Exchequer Loan Commissioners, as there has never been any statement that first preference shareholders did not receive theirs, and Commissioners would take precedence of preference shareholders. Interest upon mortgage loans also must have been paid, as that would be a first charge before preference shares; 6489–6493. Preference shareholders elect directors; 6494, 6514. If

JONES, WILLIAM BENCE, ESQ.—*cont.*

West Cork railway had been made for estimated cost, it would have paid a fair dividend; cannot say what dividend would have been paid on the other 14 miles. From arrangements made in Bill before Parliament it is pretty clear that preference shareholders will get something, and others none; such a system very discouraging; 6495–6497. How far witness's residence from station at Bandon; has property near Cork that would be benefited by railway being opened. Branch lines from trunk lines to Cork and Bandon would be an immense benefit to the country. Bandon line, bad as it is, has been of incalculable benefit to district. A little agricultural produce carried into Cork by carmen. If rates were moderate, this traffic would go by railway. Course adopted by the farmers to get their butter to the market; 6500–6504, 6506, 6507. Would suggest as a remedy for present state of things that Exchequer Loan Commissioners should have power to advance money wherever there was a *bonâ fide* traffic available; 6508. Would buy up preference shareholders. Does not know market price of preference shares; seldom sold; 6509–6513.

LANYON, CHARLES, ESQ. (*Analysis of his Evidence.*)

Is a civil engineer. With what railways has been connected; is now consulting engineer to Belfast and Northern Counties Railway. Attends the board and is acquainted with system pursued by directors, but duties of traffic attended to by manager; 6057–6063. Time railway has been open. Line from Belfast to Ballymena satisfactory, but dividends reduced since branch made from Antrim to Cookstown; 6064, 6065. Quotes fares, and states that third-class return tickets are issued by all the trains, except express; at all stations; market trains are also run at an average rate of ¾*d.* per mile. Four trains a day from Belfast to Londonderry. Trains same as when Londonderry and Coleraine line separate. Fair passenger trade. No variation in fares since railway opened, except giving third-class tickets, which had the effect of increasing the third-class, and depreciating the second; result profitable to shareholders; 6066–6076. Rate at which Londonderry and Coleraine line worked; formerly paid a rent of 10,000*l.* a year, which was an annual loss to company. Line previously worked by Mr. Rowe; is not aware whether it was profitable; traffic has changed. Thinks there has been no alteration made in the fares; 6077–6083. Names manager of railway. Is not aware that Mr. Rowe reduced the rates; cannot speak as to the receipts. Worked line for remainder of lease before altering agreement; 6084–6090. When competing line by Omagh and Dungannon opened, and effect it had upon the receipts. Second competing line opened from Londonderry to Belfast. Coleraine line a little shorter. Both companies charge same rate, competition between the two extremities only; 6091–6102, 6170. Same rate charged on whole of line between Londonderry and Belfast as on part between Belfast and Coleraine. Traffic in passengers and goods equal; is not considerable; 6102, 6103. Coal is much used for manufactories at Ballymena, and also for household purposes. Rate at which carried; 6104–6110. Up to last year was a considerable traffic in cattle. Reasons why a demand for coal inland would not materially increase if rates were reduced. Would be a large consumption. In towns near to railway stations consumption much increased. Demand increasing. Is not aware that in England 1*d.* per mile is a heavy rate, but having a long haulage would make a considerable difference. Gives gradients in Northern Counties line and loads drawn by one engine. Maximum train loads much better in England, because gradients are better. Description of coal consumed in North of Ireland, and price at Belfast; 6111–6128. Condition of Northern Counties line as to permanent way and rolling stock satisfactory, but line from Coleraine to Londonderry is in a very bad state. Not so intimately acquainted with railways in other parts of Ireland; believes some of leading lines well worked; 6129–6141. Question of lowering fares frequently came before the board. Third-class fares lower than average in Ireland. A reduction would largely increase traffic, but does not know whether receipts would be increased. Issue of third-class return tickets profitable to company. Will not say that market tickets were not so; traffic much increased; are issued for all classes; 6142–6159. If rates were lower shareholders would permanently suffer. Does not think many more would travel who now walk. Third class principally ordinary labourers and farmers; 6160–6167. Owing to there being a thin and scattered population, traffic could not be carried so cheaply in Ireland as in England. District round Belfast very populous and prosperous. Not too many railways in Ireland; competing lines should

LANYON, CHARLES, Esq.—*cont.*

not be allowed. Some of the Irish railways in a state of bankruptcy. Does not know why new lines are being constructed; 6168–6180. With exception of neighbourhood of Belfast, Irish people are less able to pay high rates than English; 6181. Rates should be high because population is not so dense, and people are so poor that they cannot pay high rates, are two things quite compatible as facts. Low rates should be charged if a railway company is to be of use to population. Does not know fares charged by Bianconi's cars. Rates (particularly third class) being lower in England than in Ireland where people are not so well able to pay high rates, is attributable to difference in numbers carried; 6182–6187. Difference between farmers and labouring class in Ireland and in England. On holidays a large excursion and pleasure traffic from Belfast among labouring class connected with manufactures; 6188–6191. Amalgamation of lines in north of Ireland most important in the interests of shareholders and the public. Great want of amalgamation between three lines from Belfast to Dublin. Difference in value has been the great obstacle in the way of lines being amalgamated in Ireland. Negotiations for amalgamating Belfast Junction and Drogheda lines failed; 6192–6197. Advantages that would arise from amalgamation of Irish railways; 6198. Great delays caused by necessity for consulting various interests. Dividends paid by Ulster, Belfast Junction, and Drogheda lines; 6199, 6200. Ireland might be divided into districts, whether two, or three, or more, would require great consideration. All lines under one management would not be desirable. Reasons why more difficult to manage than London and North-western Company or other large English lines; discussion thereupon; 6201–6212. Would have all the small railways merged into the larger ones; is quite in favour of amalgamation as a principle; shareholders would not offer much opposition; 6213–6215. 6280, 6281. In several districts traffic is still carried on by carts; necessary for railways to secure this traffic. As to what distance cheaper to carry by road than by railway. Northern Counties, by lowering fares, have absorbed all the road traffic with profitable result to company. Is not aware of any great traffic with cars in districts accommodated by railways; 6216–6229. Loans might be given to railways in Ireland at a less rate of interest than could be obtained in the market, as they have not same advantages as English railways. Points out in what way it would be an assistance. If loans obtained fares should be reduced to extent of saving effected. Reduction should apply to passengers, cattle, and minerals; 6230–6235. Carries large quantities of coal on Ballymena railway, owing to great facilities in connexion with Belfast harbour. Ulster railway has no communication with the harbour. Carries a very small quantity of coal, as canal runs parallel with railway, by means of which a great coal traffic is carried on into interior of the country at very low rates; 6236–6241. Amalgamation of smaller railways into larger ones must be by Parliamentary compulsion. Upon what basis compulsory power should be formed. Has not known an instance in which Parliament has been asked to pass a measure for compulsory amalgamation; 6242–6247. 6280–6282. If Government lent money to Irish railways, would have to do so to those English lines paying low dividends; 6248, 6249. Interest of shareholders should not be sacrificed to interests of public, and *vice versa*. Witness has just finished the Bangor line and the Larne and Carrickfergus line. Capital of latter found by shareholders, of the former principally by the contractor. Capital about 20 per cent. more in consequence. Gives amount subscribed, cost of making railway, price paid for land, description of the line and traffic upon it, and arrangement made with contractor; 6250–6279.

LONGFIELD, DR. MOUNTIFORT. (*Analysis of his Evidence.*)

Is senior judge of the Landed Estates Court in Ireland and director of the Great Southern and Western Railway; 2794. 2797. Has given much attention to Irish railways. Thinks passenger traffic would increase upon reduction of rates, but the profits would diminish. Reasons; 2794–2799. Company tried a 4d. parcel rate, but it did not pay. There was no perceptible increase in number sent. Probably reduction was not well known; 2800–2808. If fares were reduced the increase of passenger traffic would not be so great as in England. Agricultural does not admit of same increase as commercial traffic; 2809–2811. Considerable fat cattle traffic on Great Southern and Western. Reasons why store cattle are not sent by railway; 2812–2814.

LONGFIELD, DR. MOUNTIFORT—*cont.*

2818. Doubts whether a rate that would tempt a grazier to send store cattle by railway would be remunerative; 2812–2815. Attributes decrease of dividend to bad harvests diminishing the wealth and population; 2816, 2817. Is sure all traffic would increase upon reduction of rates; 2819. Proposals holding out the prospect of an increase of traffic are frequently made to the board; 2820, 2821. No material increase upon any description of cattle within last few years. If rates were reduced the ultimate result would be favourable to the companies; 2823, 2824. 2852, 2853. If proprietors of mines would supply sufficient traffic, and send full train loads, companies would be glad to carry at reduced fares, and if required would make stations and sidings; 2825–2830. Subject of reduced rates discussed frequently at the board, special inquiries made, and company guided by the result; 2831–2836. There must be a third-class train between Limerick and Nenagh, as the Act compels company to provide it. Is not witness's line, but has running powers over it; 2838–2841. Probable that first-class passengers could not get from Limerick to Dublin in a day, as they would have to pass over two different lines of railway; 2842–2844. Proposition made by board of directors to amalgamate with Waterford and Limerick Company, but shareholders refused. Would have facilitated traffic arrangements if they had done so. Thinks the terms offered were too high, as the earnings of that company have not been equal to the terms; 2845–2851. Gives reasons why the traffic in corn, coal, and third-class passengers would increase upon reduction; 2854–2861. If third-class was $\frac{1}{2}$ d. per mile, traffic would considerably increase. Class of persons who would travel; 2861–2864. Has never attempted to develop third-class traffic in vicinity of market by issuing return tickets at low fares. Discussion upon this question, and as to how loss upon general reduction should be made up; 2866–2871. 2875–2883. Thinks an experiment might be made by empowering Government to nominate an official director on any line, who should have power to consult the books and vote as other directors, and be allowed to make experiments, guaranteeing the company against loss, and Government receiving half the gain, if any. Scheme discussed; 2872–2874. 2884–2898. 2932. Mentions certain railways and places with which there are through rates; 2899–2903. 2909–2913. There are not many excursion trains. They interfere with the traffic. Would rather have all trains cheap. No reduction to reapers; 2904–2908. Traffic sometimes regulated by other considerations than those of distance; 2914, 2915. The passenger traffic would not materially increase by railway communication with the water at Dublin; the coal traffic would. Coal traffic chiefly from Dublin. At Cork coals can be brought up very close to the railway. In Dublin they are carted at an expense of about 2s. a ton; 2916–2931. 2933, 2934. Hands in paper for Appendix; 2935, 2936.

LUCAN, THE RIGHT HONOURABLE THE EARL OF. (*Analysis of his Evidence.*)

Is chairman of the Great Northern and Western Railway Company; 2937. Railway from Athlone to Castlebar (72 miles), will be continued to Ballina (106 miles); 2938, 2939. Material interests of the North and West of Ireland have not benefited by railways as much as they should. Companies too poor to work traffic at prices attractive to the people. If companies would reduce fares 50 per cent., believes at the end of five years there would be a large dividend; 2940–2942. Fares nearly at maximum, and much the same as in England. Gives dividend paid, number of passenger trains running, and fares. Line worked by the Midland Company; 2944–2950. Travelling facilities greater since railway opened; more accommodation required between Castlebar and Castlebar; 2951–2954. Reasons why experiment of running trains at low fares has not been tried; 2955. Quotes rates at which the trucks travel. Midland Company find trucks and fix rates, subject to approval of the Great Northern and Western; 2956–2960. Line to Castlebar opened three years; slight decrease in traffic since January; never earned more than 7l. per mile per week; requires 8l. 10s. to pay a dividend of 5 per cent. States amount of paid-up capital, capital advanced by Loan Commissioners, and interest paid; 2961–2965. 2970. Commissioners are about converting loan into a 22 years' annuity; inconvenience that will arise to company in consequence; 2966–2969. 2973–2976. 3010–3017. Preference stock 5 per cent. Preference shares not worth more than 90 per cent. Irish credit low in London market; mentions as an illustra-

LUCAN, THE RIGHT HONOURABLE THE EARL OF—cont. tion an interview had with Governor and Deputy Governor of Bank of England; 2970-2972. Unless fares are reduced 50 per cent., traffic would not materially increase; quotes rates, and states that cattle, corn, and potatoes would then be carried by railway. In four or five years traffic would more than double; 2977-2979. 3039. Government should negotiate with different companies and buy up all the Irish railways; thinks whole of the ordinary stock could be bought at 50 per cent.; discussion as to the preference shareholders; 2980-2998. Strongly opposed to management of railways being placed under Irish government; 2999. Government should lease railways to large English companies upon condition that there should be maximum fares and minimum accommodation. Would have only three railway companies in Ireland (instead of 54 as at present), one for the North, one for the South, and one for the Midland district, with a board sitting in London. Temporary deficit consequent upon reduction of rates should be added to capital account; discussion upon the question; 3000-3021. No difficulty in getting English companies to lease Irish lines. Very few additional lines required; none should be constructed in future unless county find the land, as is done for roads; quotes cost at which lines could be constructed; 3022-3027. Course to be adopted in the case of lines in process of construction or for which Acts have been obtained. Not many new lines proposed this session. Great object for Ireland to reach the English markets. Dutch and Germans can send beasts to English markets cheaper than they can be sent from Ireland; quotes rates; 3028-3031. If heavy goods were sent for $\frac{3}{4}$ d. per mile, could successfully compete with the sea; 3032, 3033. Does not think a coal trade could be established in the West of Ireland, as it is cheaper to burn turf; gives illustrations; 3034-3037. Difficulty in obtaining back freight; 3038. Experiment has not been tried of reducing rates, as there would be a difficulty in getting the Midland Company to reduce; 3040-3042. Enumerates certain goods which would be carried upon reduction of rates; 3043-3050. Does not believe that store cattle would continue to be driven along the roads if the rates were lower; is certain that nearly the whole would go by rail; 3051, 3052. Witness's line would have the whole of the fish traffic if there were a night train; greater part of this traffic, which is considerable, is carried on by small smacks; 3053-3057.

MACAULEY, MR. JAMES HYNDMAN. (*Analysis of his Evidence.*)

Is manager of a bank in Coleraine; 7283. Mentions different railways between Coleraine and other parts of Ireland, and length of the lines; 7284-7287. Dissatisfaction often expressed at the differential rates charged. Are no fixed charges. Instances differences in rates charged for goods and coals from Portrush and from Londonderry to Coleraine. All heavy goods are carted from Portrush in consequence of the high rates by railway; quotes rates; 7289-7291. Coleraine people are now making application to Board of Trade for a loan to improve navigation of river; hopes in time to have it made navigable, so as to make Coleraine a sea port; will then be independent of the railway companies. Long journey from Londonderry deteriorates value of certain goods. There is a port both at Londonderry and at Portrush. Both the railways worked by same company; 7292-7299. 7311-7315. Similar differences in passenger rates; facilities are given to Londonderry people which are not given to Coleraine people. Has often been told that different rates are charged to different individuals on same line for same quantity of goods; 7300-7302. 7308-7310. Thinks rates for passengers and parcels have been increased on Northern Counties line between Coleraine and Belfast within last two years, but fares on Londonderry and Coleraine part of line have not been altered; 7303-7307. If Government purchased railways there would be regularity in charges and perhaps at lower rates. Rates now high; if lower, traffic would considerably increase. Rates from Londonderry to Coleraine very low; no goods go along the roads in that part of the country; 7316-7320. Different opinions expressed as to how loss should be met if Government purchased the railways. Unless railways could be made to pay, it would be unadvisable to make a change. If fares were all raised and re-arranged might be more suitable than some lines charging high and some low rates; 7321-7327. Coleraine has communication by river Ban, it is navigable up to Lough Neagh. Receives very few goods from Belfast by means of that river. Chief port is Portrush. Population has not much increased in Coleraine; it is

MACAULEY, MR. JAMES HYNDMAN—cont.

an improving town. Has only one linen manufactory; 7028-7032. Has known two instances where merchants have experienced much difficulty in recovering damages from railway companies for goods lost or injured; 7333.

MACFARLANE, HENRY JAMES, ESQ. (*Analysis of his Evidence.*)

Is a magistrate of the county of Dublin, and a member of the Council of Royal Agricultural Society; 6515, 6516. Has been brought very much in contact with the authorities on various railway boards in Ireland, principally in connexion with the annual shows which are held in each province alternately, and the conveyance of stock and agricultural implements of all kinds. Has not latterly experienced so much difficulty in making arrangements with managers of railways for these shows; describes nature of facilities afforded, and what has been done in consequence. A great desire on the part of many people to see them; a liberal reduction would largely increase passenger traffic. Would encourage holding them in towns where they have not been already held. Afraid to hold them in some towns, not knowing what the railway arrangements will be. Reasons why they should be held. General complaint of the arrangements made in Dublin. Greater facilities for sending goods from Liverpool to certain country towns in Ireland than from Dublin, and at lower rates. Gives an illustration, showing the facilities given by the North-western Company to go direct to England, and the impediments, on the other hand, which are thrown in the way of travelling from Dublin to the northern districts, and the heavy cost of the journey; discussion thereupon; 6517-6529. Facilities afforded to travellers from north-west parts of Ireland to Dublin are very bad. Explains how it is that a person cannot go from Omagh to Dublin, and spend a day there, without being absent three days. Was told by a director of Irish North-western line that if there were greater facilities between these two places there would be six times the passenger traffic. General impression that Irish North-western directors are attending more to financial questions than to development of traffic. Gives a curious illustration of the want of facilities for travelling on the railway, and states that since it was opened the accommodation afforded is much less than it was before; 6530-6544. Mentions the high rate charged for bringing potatoes from Omagh to Dublin; 6545, 6546. Coal and turf both used in Omagh. Rates for coal satisfactory. Reasons why he does not think that if coal could be brought into the interior of Ireland at very low rates it would supersede use of turf. There is not sufficient supervision over railways; instances the accident to the late Mr. Senior, and suggests a remedy to prevent similar ones occurring upon that line. Lord Campbell's Act is to a certain extent a sufficient safeguard or inducement to directors to take great care for the protection of life. Board of Trade or some Government authority should have a general power to compel railway companies to make alterations in their works for the safety of the public; at present time financial difficulties stand very much in way of what companies see ought to be done. A friend, in order to be in time to catch Cavan train, induced engine driver to put on extra steam. Reads a letter extracted from a newspaper, showing the inconvenience to which a passenger was put in consequence of Irish North-western Company having altered their times without giving sufficient notice; 6547-6558.

MALCOLMSON, WILLIAM, ESQ. (*Analysis of his Evidence.*)

Is chairman of several Irish railways, and director of four others; 3363-3366. Attention called particularly within last five years to Irish railways; present state not satisfactory to shareholders, but conceives public are fully inconvenienced; 3367, 3368, 3399. Suggests that Government should advance money at a low interest to those companies who can show an income beyond working expenses of the line; full discussion of this scheme, as to saving effected, interest to be paid, and whether the public would receive any benefit from such arrangement; 3369-3393, 3598-3606, 3610-3622. Railway companies would reduce charge if Government would make the advance; reduction would not be considerable; 3393-3395, 3421, 3422. Witness is connected with some railways which pay no dividend; Waterford and Limerick last paid 1 per cent.; fares on the line; 3396-3398. Public difficult to satisfy in matter of railway accommodation; 3400. Complaints made of want of facilities of going to and returning from one point in a day; thinks with third-class passengers it neither suits their convenience or wants; on short

MALCOLMSON, WILLIAM, Esq.—*cont.*

lines they can do so. Market tickets are issued at one-third fare; succeed well, but have not materially increased the receipts. Experiments made by issuing third-class return tickets, but abandoned as not being remunerative; 3401-3418, 3485-3490. Irish farmers do not use trains going less than from eight to ten miles from town; 3419, 3420, 3556-3559. All railways with which witness is connected have had loans from Exchequer Loan Commissioners; terms for which money lent, interest paid, and course pursued when instalments have to be paid; 3423-3437. There is a through booking system over Limerick and Waterford Railway with reference to England; 3438. Witness is connected with steamboats; to his interest to have a reduction of fares; 3439, 3440. Several new lines of railway in progress; reasons for constructing new lines when old ones seem unremunerative, that cattle and agricultural produce increase in value at least 5 per cent. by facilities which railways afford, &c. Landholders and others further benefited by a reduction of the rates; 3442-3448, 3494, 3495. If Government purchased railways, landholders, &c. would be willing to share loss consequent upon reduction of rates; 3449-3452. States that Mr. Ryan is partly incorrect in stating that by allowing a person with butter to travel free the traffic is driven into Waterford to the injury of Limerick; the arrangement was made in order to induce the farmer to sell his butter himself, thus doing away with intermediate party; was disappointed in the result as to number who availed themselves of it; 3453-3456. Very little local traffic between Limerick and Waterford; the great bulk of the Limerick goods traffic goes under what is called the through-rate system, either by Waterford or Dublin. Advantage lately in favour of Tipperary, as between Tipperary and Waterford difference is principally caused by terminal expenses; gives an example; 3457, 3458. Tipperary is competed with by several water routes to Waterford and to Dublin; there is also competition; 3459, 3460. Changes in the rates are left pretty much in hands of traffic managers; 3461, 3462. Cannot explain how impression has got abroad that rates are influenced to disadvantage of Limerick; 3463, 3525-3527. Has through booking rates with the London and North-western and South Wales railways; 3464-3467. Through-tickets are issued to Milford, or to London via Milford; 3468, 3469. Cattle traffic has been the best source of income; trade decreasing from scarcity of cattle. Present rates do not affect transmission, as railways carry nearly all the traffic; 3470-3474. There are slaughter-houses for pigs, but not for oxen, at Waterford; for last two years, dead meat, &c. has been carried to Milford for London; this traffic not so great as from Aberdeen, as butchers will not try it; 3475-3480. Has heard that animals are much bruised on the journey to London; not many fat cattle; principally store cattle which come through Waterford to be fattened in England; cattle less injured by steamer than by railway; 3475-3484. Names extensions applied for this session, and states number of miles; more than in any previous session; 3491-3493. New lines promoted generally by landed gentry, who, to a certain extent, find the capital; states course pursued by the contractors to raise money; discussion as to the issue of "Lloyd's bonds;" 3495-3506. The reason coal is carried from Waterford to Tipperary more cheaply than from Limerick to Tipperary, is, that the mileage is longer to Waterford, and though there may be a difference in favour of port of Waterford, it is done more to secure the traffic; 3507-3509. Through rates from Limerick and Tipperary do not give a preference to Waterford. How rate divided between ship-owner and railway company; 3510-3523. Difficult to say what the fixed terminals are at Waterford; 3524. Thinks no hardship arises from the fact that it takes a third-class passenger four days to get from Ennis to Dublin and back; 3528-3530. Delay at Limerick junction caused by Post-office interference; no perceptible difference in the traffic in consequence; 3531-3536. Considerable decrease in the receipts of Waterford and Limerick Railway Company in year 1863; rates were lower at Foynes end of line, but raised to equalize over whole system; result satisfactory to company; Limerick and Foynes does not pay a dividend; decrease attributable to trade falling off; 3537-3546. Increase in Waterford and Kilkenny line from having inconvenienced the public by arranging trains; hands in statement showing per-centage of third-class passengers on six lines; discussion thereupon; 3548-3554. Majority of shareholders in Waterford and Limerick line are Irish; in Waterford and Kilkenny, English; 3555. Proposals made to send timber, if the rates were low, to a shipping

MALCOLMSON, WILLIAM, Esq.—*cont.*

port. Has universal traffic from Birdhill on Castleconnel line; 3560, 3561. Bianconi's cars do not run in competition with witness's lines in same district; there are some in neighbourhood of Bruff. Believes that the railway carries all minerals produced in that district; more proposals made to company to bring back coal for smelting purposes than to carry increased quantities of minerals; the trucks now bring back Indian corn and breadstuffs; 3562-3568, 3609. Quantity of coal, though considerable, not increasing, as there are very few manufacturing in district; some small ones are being set up. Water-power conveniences for manufactures witness is engaged in, are quite as important as railways, and cannot be competed with. Uses both water and steam power; 3569-3573. Clonmel is the most inland town, in which witness has established flax manufactories; 3574, 3575. Decrease in coal traffic on Waterford and Limerick line in 1863 as compared with 1861; receipts show that railway benefited by the traffic; 3576-3578. Opinion of board that reduction of rates would not be followed by such an increase of traffic as would make up loss; 3579-3585. Application only made from Glasgow for special rates for sugar; 3586, 3587. Two years ago the cattle traffic was increasing; a general falling off since. The rates were advanced three years ago 10 per cent. on the Waterford and Limerick and Great Southern and Western lines; 3588-3592. Local rates sufficiently low to ensure bulk of traffic; 3593, 3594. By amalgamating the small lines some expense of management would be saved; shareholders averse to amalgamation. Have been negotiations for amalgamating Waterford and Limerick with Great Southern and Western; 3595-3597. Government advanced a large sum of money to complete Dublin and Galway railway. Does not know what dividend is paid by Dublin and Kingston railway; 3607, 3608. Would be glad to sell railways at 50 per cent. of original cost; thinks Great Southern and Western would not; 3623, 3624. Could carry more passengers without additional expense; thinks working expenses of goods traffic do not increase beyond a certain proportion. Goods trains are not heavy in consequence of indifferent gradients and curves; they are more gather-up trains, conveniencing stations along the line; 3625-3631. Does not think with present gradients that coal could be carried for $\frac{3}{4}$ d. per ton; is connected with a German company which carries at $\frac{3}{4}$ d. per ton, the gradients being good. Gradients on Limerick and Waterford line; 3632-3636. On English lines coal rate not more than $\frac{3}{4}$ d., companies finding the waggons; they are not found on the continent; on Cologne and Minden line, coals are carried into Holland at $\frac{3}{4}$ d. per ton at a profit; in Ireland the rate is more than 1d.; from Waterford to Clonmel exactly 1d., there being river competition; 3636-3645. No special rate to individuals; 3646, 3647.

MALLET, MR. ROBERT. (*Analysis of his Evidence.*)

Is a member of the Institute of Civil Engineers, London, and Fellow of several scientific societies; also Vice-President of the Institute of Civil Engineers of Ireland; 2134-2136. Has been long resident in Ireland, and from 1836 to 1856 concerned in all the large railway and other works, and is well acquainted with the industrial elements of Ireland generally; 2137-2139. Thinks railways are of more importance to Ireland than to any other part of British dominions; reasons; 2140. If coal could be obtained for 17s. per ton, it would be more economical than peat; 2141-2143. Peat is scarcely available for locomotive engines; states the best way of obtaining it; 2144, 2145. Limit of water power of Ireland; relative cost of water and steam power. Is very important to get coal into Ireland at a much cheaper rate; by establishing steam colliers, and low fares on railways, coal could be supplied at depôts along the stations for 10s. or 12s. per ton. The price at the quay at Dublin varies from 14s. or 15s. up to 22s. It can be delivered at one railway communicating with another at the port, but then cost of taking it along the railway must be added. Dissents from opinions of three eminent engineers that coal could not be carried profitably upon Irish railways at $\frac{3}{4}$ d. per mile with back freights, and $\frac{3}{4}$ d. if they came back empty, provided the run was 100 miles or more. Coals are carried in England at 1d. per ton, and pay a profit of 200 or 300 per cent.; the present price into the interior exceeds what it ought to be; 2146-2160, 2172-2177, 2181-2183. A large proportion of the cost of coal in Dublin is occasioned by want of steam colliers and mechanical coal-whipping; 2162-2164. Thinks that by proper arrangement, back carriage could be obtained for the coal trucks; discussion thereupon; 2165-2171. Will supply figures showing working cost of railways per ton per mile; 2278-2280.

MALLET, MR. ROBERT—*cont.*

Goods waggons carry from 5 to 10 tons, they should be quite as large or larger than those on the Great Northern; 2284, 2285. Describes particularly the class of manufacturing industry to which coal is chiefly applied; 2286–2291. Enumerates certain materials existing in Ireland, which might be obtained as back freight, if coal could be carried at $\frac{1}{4}$ d. per mile. Cause of failure of attempt to smelt iron with turf; 2191–2215. Trusts that the Irish Railway Act requiring all tramways to be of same gauge will be repealed. A permissive power to construct railways on a gauge not exceeding 3 feet would be of importance in many of the poor districts. For quarry purposes a gauge of not more than two feet would be desirable; 2216–2218, 2225. Would make railways in connexion with existing railways through a poor district as feeders; 2219. Having a narrower gauge for branch lines would involve a break of gauge, but that should not prevent its adoption in certain remote districts; 2221–2224. Discussion of the narrow gauge, and cost of transshipping minerals and coals from these to the ordinary gauge; 2225–2236. Additional lines are required in Ireland upon the broad gauge; reasons; 2237. Cattle trade of Ireland with reference to the improved means of transport; sufferings of the animals upon railway and in the boats, and proposed remedy; 2238–2241. Witness cannot say whether cattle fares are too high, but is clear that all the passenger and mineral rates should be considerably reduced; 2242, 2243. As to connexion between dairy farms in Ireland and the railway system; description of a patent for concentrating milk in order that it may be sent long distances by railway. Discussion whether a traffic trade in milk could be profitably established in Ireland; 2244–2249. Thinks Legislature should compel railway companies to try the experiment of reducing the tolls, as they are not likely to do so themselves; states how control should be exercised, and that guarantee should be given to make up temporary loss. Discussion of this scheme; 2250–2281, 2283–2290, 2295, 2296. First and second class fares should be reduced at least one third; they would then be on a level with fares in Prussia, Germany, and France; 2282. Diminution of the feeling (prevalent some years ago) that the absence of effective industry in Ireland results from the habit of the people relying upon the State; 2291–2294. Possibly if all the railways were amalgamated into one system, or into two or three large groups, capitalists might be found willing to lease the lines for a term of years, trusting to make them profitable by better management and an increased traffic from reduction of fares; 2297, 2301–2304. Witness thinks it very likely that if Government became proprietors of all the Irish railways, they could get a great company to work and manage the lines upon certain conditions; 2298. A great portion of the capital employed in making Irish railways is raised upon debentures, and it would be of great advantage to have the Government responsible for the interest of the difference between a high and low rate; 2299, 2300. A reduction of fares and uniform rates for goods and passengers would prove advantageous; 2305–2307.

MELDON, JAMES DILLON, Esq. (*Analysis of his Evidence.*)

Is a solicitor in Dublin and a large landowner in Galway; 6732–6734. Is in favour of Government taking all the railways and working them by a board of commissioners. Has prepared a statement showing number of lines, their average length, and number of separate boards of directors, solicitors, engineers, and secretaries. Remuneration paid to directors. A board sitting in Dublin, consisting of three intelligent business-like men, would be able to manage the railways; vast saving of expense would be effected by amalgamation and by traffic being fairly developed. Inconvenience that arises from want of unity of action between companies; 6735, 6736, 6747–6751. If fares were reduced one half, witness would be able to send about 3,000 tons each year of agricultural produce to Dublin, and example would soon be followed by the farmers. Trucks could take back manure. Uses a good deal of hay in Dublin, cannot have it from Galway owing to high rates. Could also send large quantities of turnips and mangold if rates were about 5s. or 6s. a ton. Same charge made by railway whether manure worth 3s. 6d. per ton, or guano worth 12l. per ton. Not one-twentieth part of the cattle at Ballinasloe fair are brought by railway, in consequence of high rates and insufficiency of rolling stock. If railways were amalgamated, rolling stock could be borrowed from another line in times of pressure. Companies do not now borrow from each other. If rates were reduced one half, would carry all the cattle of the country. Lean cattle sent to Ballinasloe fair are

MELDON, JAMES DILLON, Esq.—*cont.*

afterwards taken to Leinster and England to be fattened. Preferable to send them by railway even for a distance of 25 miles; 6737–6746. Reasons why it is hopeless to expect companies will amalgamate of themselves. Serious inconvenience for want of amalgamation of line between Dublin and Belfast. Relates an incident that occurred upon that railway three years ago. Same interest would not be opposed to proposition for selling railways to Government; matters would be in the hands of the proprietors; 6747–6755. Large companies whose preference and ordinary stock yield no return would be willing to sell at prices which fairly represent its depreciative value. How this could be done without cost to the Government. Would pay them a shade more than the market value; 6756, 6757. Discussion as to whether companies would hold back with hope of getting more if purchasing the railways were a matter of bargain between Government and individuals, and not compulsory. Might be necessary to pass an Act providing that majority of shareholders at a public meeting should bind the minority. How Government should arrive at value of shares; should be liberal. Having regard to enormous saving effected in management, thinks Chancellor of Exchequer would have a very large surplus at end of year, even out of present receipts, but under new management expects receipts would double; 6758–6766, 6784. Would require special legislation to meet case of those companies who refuse to come into Government proposal, and throw impediments in the way of traffic; 6767–6770. Power of accepting Government proposal rests with ordinary shareholders, but in some cases the consent of preference shareholders must be obtained; 6771–6781. If Irish railways in hands of one company, there would be some little difficulty as to extensions; how difficulty might be got over; 6782, 6783. How value should be determined in the case of lines paying no dividends; many would pay as soon as Government took them. Thinks Government would act fairly and liberally with the shareholders. Terms upon which they would be willing to sell. Present earning eaten away by salaries; 6789–6791. Shareholders have not the power to force directors to amalgamate; might turn them out and elect others; have never stopped their money; doing so would soon cause them to retire. Shareholders hold their half-yearly meetings, but directors always manage to secure sufficient proxies to control meeting; 6792–6798. A great deal of Great Southern and Western and of the Midland capital is held by English capitalists who will not invest in small lines; 6799, 6800. Does not know salaries of the 100 engineers employed on various lines in Ireland. A return of all paid officers could be easily obtained; 6801.

MULVANEY, WILLIAM THOMAS, Esq. (*Analysis of his Evidence.*)

Was for a considerable time a Commissioner of Public Works in Ireland. Since 1855 has resided at Dusseldorf, in Prussia, being part owner and sole manager of two collieries in Westphalia; 1047–1052. His attention has been called to the railway systems in Ireland and Germany; 1053–1056. In consequence of high rates coal could only be sent by railway about 50 miles, but a reduction took place, and it now goes about 500. States the difficulties that had to be overcome before reduction took place, which was finally effected by 32 collieries guaranteeing to deliver 25,000 tons in a year at Magdeburg at a proposed rate, subject to a penalty equal to the original freight in case of failure; 1056–1060, 1062–1065, 1082, 1083, 1237–1239. Witness sent as an experiment 10 tons of coal to Magdeburg (54 German miles), and had to pay for freight 2l. more than the coals realized, although they were equal to and purchased at the same price as English coal; 1061, 1073–1079. In consequence of State jealousies, the rates are not the same on all the railways. Reduced rate rather less than English rate, but in some cases there is a terminal charge of 3s. a waggon of 5 tons at each end of the system; 1066–1069. The result of the arrangement has been very satisfactory to the railway companies. The Dutch-Rhenish line, from having no trade in coal, had, last year, 147,000 tons from Germany alone; 1070, 1071. English coal goes chiefly by canal to Berlin; 1080, 1081. In Prussia a number of the railways belong to the State; 1084, 1085. The German unions of railways, consisting of various boards, fix all rates for the through traffic; 1086–1090. The system of carrying coal at the low rate is spreading. Statement as to the collieries in Westphalia; 1091–1097. Income much increased in consequence of the reduction. Reads from a report of the Cologne and Minden Railway, showing that every reduction in the rates, whether

MULVANEY, WILLIAM THOMAS, Esq.—*cont.*

in passenger or goods' traffic, has increased the dividend. Gives some particulars as to their earnings, mileage, and capital; 1098-1115, 1161-1164. Passenger fares lower in Germany than in Ireland. Gives average charges. A slight reduction has been made, but not to the same extent as for coal. A considerable reduction has been made in the rates for iron ores, &c., and matters essential for reduction of iron; 1116-1120. In Germany there are very few return and no season tickets issued. On the Rhenish Railway there have been reduced charges for excursion trains; 1121-1130. The German union do not permit special rates to individuals; the tariff is published. Thinks there should be variable rates; gives reasons. The Government approve the rates only upon those lines in which they have an interest; 1131-1138, 1165-1169. Coal could not have been sent to Bremen and Hamburg unless terminal charge had been reduced. There is an agitation for a like reduction in the intermediate towns; 1139, 1140. Companies find it to their interest to make sidings for the unloading of coals, otherwise they would not get the trade; 1141, 1142. The same rate should be charged by two different companies carrying the same distance, although one may have been put to a great expense in providing sidings; this question discussed; 1143-1147. There is very little difference in speed between the German and Irish trains; 1148-1150. In Prussia competition was prohibited, but the Government are now changing the law, and promoting railways and canals in order to produce competition; 1151-1154. Cost of obtaining a railway bill much less in Germany than in England; 1155. The construction of a railway in Prussia rests with the Minister of Commerce and Public Works; 1156, 1157. The monopoly guaranteed to certain railway companies, limited generally to 50 years, with the power of increasing it upon application of the whole company and with the sanction of the State. In the case of the Cologne and Minden Railway, concessions were made upon the understanding that after a certain period the Government should have power to take possession; 1158-1160. In Hanover, Brunswick, and Bavaria the rates are fixed more with reference to the interests of the public than the railway companies. It was represented that a reduction of the rates was essential in order to raise the interest of the trade of the country, and that such reduction would be profitable to the companies. The Government would not have sanctioned the reduction if it had not been for their benefit; 1171-1174. The management of railways an exceedingly difficult question. Competition is essential to success in almost all great commercial matters, but thinks it is not the province of Government to manage railways. Putting Irish railways under one management would lead to a monopoly. Complains that the railways are not joined together; none of those which come into Dublin go down to the harbour, owing to the want of meeting trains coming from Cork to Belfast; goods passing through the centre of Ireland take nearly a week, whereas if a suitable connexion were made they might go through in 10 hours; 1175. There is a great deal of traffic which might be developed in Ireland if rates were lower. Traffic small in comparison with what it might be; 1175-1182. Railway companies have nothing to fear from competition by sea. The rate for coal upon Irish railways is about $\frac{1}{2}$ d. per ton per mile; 1183-1186. If fares were reduced one-third, there would be a temporary loss, but the ultimate success would be certain; discusses this question; 1226-1235, 1240-1250. The district with which witness is connected is a vast coal field, and has enormous capabilities of production undeveloped. If rates were reduced, increase of traffic would not be so great in Ireland as in Westphalia, but the introduction of coal into Ireland, coupled with high rates, would greatly improve the country; gives reasons. A reduction of rates for travelling and carriage of agricultural produce would be beneficial; 1190-1194. Potatoes, corn, and agricultural produce are sent by railway from the agricultural provinces of Prussia into manufacturing districts of Westphalia and the Rhine at very low rates; 1195-1197. In Ireland there are ores rich enough to pay for working if coal were near. In Galway there is coal, but not so free as in Prussia, as there is always some difficulty as to title; 1198-1200. Railway companies have not run a branch into the Kilkenny and Tipperary districts. It may not pay to make branch railways to develop the Irish coal trade, but witness believes a reduction of the rate would very much increase the English coal trade; 1201-1205. Coal can be raised in Prussia better than in Belgium; 1206. At Cork the consumption of coal is increasing; it is cheaper in the eastern parts of Ireland than in Dublin; 1208-1212. Cannot explain why there are no facilities for unloading coal in many of the Irish ports; only partially afforded

MULVANEY, WILLIAM THOMAS, Esq.—*cont.*

in London; 1213, 1214. There is a great want of enterprise in Ireland; 1215. Does not know the price of coal at the stations, but at Kildare, by canal, it is 14s. or 15s. per ton; 1216-1218. Freight on railways ought not to vary according to the time of year, but fixed rates are inconsistent. Would fix a much lower maximum (which should not be reduced in all cases) than at present, and allow the greatest possible liberty to go below that maximum. Thinks that railways are intended not only to carry existing traffic, but to seek out and create new; 1219-1223. The profits of Irish railways have very much decreased. Considers that directors are in error in assuming that railways are constructed for passenger instead of for goods traffic; 1223-1225. The reduction in Germany is chiefly in the case of new traffic; 1236. There are special rates for Government purposes, and for their own service, but for the public everything is fixed and published. Is aware that in England and Ireland special bargains are made with individuals for the carriage of goods. Mentions an instance where the practice of having various rates has been attended with great advantage; 1251-1260. When the coal traffic was established between the collieries and Magdeburg, an arrangement was made between the producer, the carrier, and the seller. There is a special rate for coal, but not for other produce; 1261-1265. In parts of Ireland there is a large demand for coal, but not in the interior; 1266-1270. Scarcely any back carriage in the trucks which convey coal on the German lines; 1272. The railways do not amalgamate, they only unite for the purposes of through traffic; the principle being uniform rates and tolls only for the through traffic; 1272-1275. Passenger trains are frequent in the district with which witness is best acquainted; 1276. There is a feeling springing up in favour of a system of competition; 1277. The State has several lines, of which a report is published yearly, showing their cost, &c.; 1278, 1279. Coal could be carried to Paris, the distance being about the same as to Berlin, but English coal could not be laid down there as cheaply as witness could lay it down; 1283.

Further examination.

Wishes to show the impossibility of developing any system without a connexion with the various systems of railways that exist in Dublin; without that no system like that of the German unions can be effected. Sidings and branches to places that would afford trade should be made by companies without incurring the enormous expense of separate Acts of Parliament. In the German union, the waggon work is provided by the various companies, who furnish their quota for the purpose of through traffic, and arrange a tariff for the transport of goods, and fix rate for waggons passing over the lines of another party. Had difficulty in inducing the union to adopt a per-centage deduction from the rates for full trains running through from fixed station to fixed station. This system might be adopted to great advantage in Ireland. The organization of goods trains at fixed times has been found beneficial in Germany. The Irish fares are too high, and as a natural result the dividends are diminishing. New markets might be developed by low variable tariffs. Fixed rates, however low, may nevertheless bear a certain new traffic. German passenger rates should be adopted as a maximum in Ireland. Introduction of English coal into interior of Ireland would lead to development of the coal districts which exist there. States how present changes might be effected; 1847, 1848. Plan which exists in Germany for decreasing expense of making sidings and branches; 1849-1860. Level crossings (very prevalent in Germany) where the traffic is increasing, injurious; 1861, 1862. Circumstances connected with development of coal traffic not exceptional in Germany in consequence of the coldness of the country and the expense of fuel; the private consumption is a small matter. Before construction of railways wood was used for manufacturing and domestic purposes, although within a few miles of the coal pits. Increase of consumption of coal did not take place until the rates were reduced; 1863-1866. Discussion as to whether plan of raising money on terminable annuities would increase charges upon railways; 1867-1875.

MURLAND, J. W., Esq. (*Analysis of his Evidence.*)

Irish Great Southern and Western Railway permit persons to take their goods to and from the railway, thus saving the charge for collection and delivery. In calculating rates terminals are taken into account; 4568-4672. Concurs with Mr. Haughton in matters of fact, but not in opinion; does not take so gloomy a view of the prospects of traffic increasing in Ireland, though

MURLAND, J. W., Esq.—*cont.*

thinks it not so capable of development as the traffic of this country. If rates were reduced, traffic in cattle and in third-class passengers would increase; but there would be temporary loss to the railway companies. Would not advise a reduction; 4736–4738. Coal traffic will steadily increase. If rates were reduced 50 per cent., consumption would not materially increase. Conditions under which cattle traffic is conducted render it expensive to work; question discussed; 4740–4759. Reduction of rates would give rise to some traffic not now anticipated; that in grain would probably increase. Cultivation of flax would not be materially affected by a reduction; reasons; 4760, 4761. Has been nearly 17 years chairman of Dublin and Drogheda Railway Company, and for some years a director of the Irish North-western, which extends from Dundalk to Londonderry. Not so well acquainted with lines in that part of the country as with the Dublin and Drogheda and Great Southern and Western. In some respects there is much denser population on a portion of the Dublin and Drogheda line than there is on the Great Southern and Western. Has more third-class traffic (chiefly for short distances to the markets) in proportion. Interest to give third-class return tickets on that line. Proportion of return tickets to single tickets for short distances is as three to one; 4761–4767. No important towns between Dublin and Drogheda. Line extends to Oldcastle. Books through, with the northern lines, at same scale of fares. Belfast Junction Company issues third-class return tickets, but Ulster Company does not. Complaints in Belfast of communications being in the hands of three different companies. No discord between them; 4768–4775. Accommodation between Dublin and Belfast; speed of trains; class of passengers and fares. Great traffic between the two towns. Same carriages and waggons run through, but not same engines; 4776–4782. District between Drogheda and Oldcastle richer than average of district traversed by Great Southern and Western; is not the most productive in way of traffic; 4783, 4785. Does not carry near so much cattle as Great Southern and Western in proportion to receipts; 4784. Paid five per cent. dividend until competing railway opened between Dublin and Navan; that line has never paid a dividend. Effect competing line had upon traffic; decrease in 1861 attributable to bad harvests; is slightly recovering; 4786–4792. 4837–4840. Cattle traffic stimulated for a short time by bad harvest; 4793, 4794. Manufactories, such as those at Drogheda and Balbriggan add to traffic; 4795–4797. Has some coal traffic between Dublin and Clones and Oldcastle; 4798. Consumption has increased, and will continue to do so. Classes who consume coal; 4799–4805. Coals can be brought to Drogheda; there is a good fleet of steamers and small sailing vessels trading to it. Railway comes near the water. Mileage rates for coal and price at Drogheda and Dublin; 4806–4813. Traffic in district round Belfast much larger than in agricultural districts, but railway not more prosperous than those in south of Ireland. Quotes dividends paid by certain lines. Were not very expensive lines; 4814–4825. Traffic within a certain radius of Belfast is large. The Irish North-western paid no dividend; it now pays the interest on its bonds. Traffic fell off in 1862 and 1863; is slightly mending; railway made with economy; 4826–4834. Trade to Belfast has much increased, but traffic has not increased in proportion. Mentions change that has taken place in the linen trade. Carries a great quantity of flax. Reason why it is principally grown in Ulster; 4835, 4836. 4851–4873. Would make a through rate through any town between Dublin and Belfast for this traffic if it were demanded; discussion thereupon. Compared with present population traffic in Ireland has increased. Does not think railways have suffered from emigration; 4841–4845. New lines are being constructed in the North, although present lines are to a great extent unprofitable. Thinks the extension of unremunerative lines a matter of speculation; 4846–4850. It would be an advantage if three or four of the northern lines were amalgamated. Difficulty in the way of the Irish North-western amalgamating. Tried to bring about an amalgamation between witness's company, the Belfast Junction, and the Ulster, but failed. Reason of failure. Would not be a necessary part of amalgamated company to embrace the Coleraine line, it being to a certain extent independent, but the other four should be if the convenience of the public is to be consulted. There are eight lines between Armagh, Londonderry, and Belfast. A solicitor tried forcibly to amalgamate the Dublin and Drogheda and Belfast Junction, but shareholders almost unanimously rejected the proposition; 4874–4890. Lines paying no dividend will not be worked so well as paying lines. Wants of the

MURLAND, J. W., Esq.—*cont.*

public not so well supplied now; 4891, 4892. Shareholders would not submit to a loss unless they were sure of an ultimate gain; 4893–4895. No objection to transfer of return tickets; 4896, 4897. Thinks a gradual reduction in all classes of passenger traffic (particularly third class) and in goods would probably recover themselves in a few years; 4896–4900. Third-class fares should be reduced to $\frac{1}{2}d.$ per mile, but would begin at $\frac{3}{4}d.$, and wait and see effect on each class of traffic. There would be no disadvantage in decreasing rates gradually; 4901–4904. Has not known third-class fares raised, but sometimes lowered. Third-class receipts of Dublin and Drogheda Company bear an excessively small proportion to total receipts; this is rather in favour of reduction; 4905–4908. If amalgamated, an increase of traffic in populous parts would be a set-off against loss in sparsely populated parts. Experiments of amalgamating might be successful, but difficult on individual lines. A proportionate reduction should be made in first and second-class fares when third-class lowered; 4909–4913. All the Irish railways might be managed by a single company, and considerable improvements leading to increased development of traffic introduced. Saving in management would not be so great as expected; 4914–4919. Thinks there are no mines worked in the north of Ireland in district with which witness is connected as a director. There are some collieries near Dungannon accommodated by canal; 4920, 4921. A great many manufactories have been built in Belfast, and some large mills near there. Does not know of any manufactories having been established in consequence of the construction of railways in Ireland. The population of Portadown has increased from 1,000 to 10,000 since Ulster railway made; 4923–4928. Many of the railways have been made at an unnecessary cost, but too little of the money has been spent upon the road, consequently they are badly made, and the sleepers defective; instances the Cork and Youghal line; 4929–4936. Dublin and Drogheda line has no through-booking with Armagh and Newry line, except through the medium of other companies. Could not give tickets through from Dublin to Armagh by Newry and Armagh line; 4937–4939. No line in Ireland in as good condition as London and North-western line. A few of them are very good; 4940–4942. Return tickets on Sundays at single fares for all classes of passengers are issued on Dublin and Drogheda line; adds much to the traffic in summer time; same trains run in winter. States for how long return tickets are available for certain distances. Third-class will only avail themselves of excursion trains at holiday times; trains are then crowded, and financially satisfactory; 4943–4951. Would like to see experiment of reducing rates and fares tried, but not at expense of shareholders. If Government would purchase railways, shareholders would be willing to take a smaller dividend, and in this way they might have some margin which could be applied to reduction of fares; 4952. Lines, although not in first-rate repair, would bear a much larger traffic. State of repair an important question if Government were to purchase them up; 4953–4956. Shareholders of non-paying dividend lines would not be disposed to make the Government a present of their capital, many would sell at very moderate terms. There are some speculative people who would buy the shares of some lines at low prices, but with regard to others, purchasers could not be found. Line from Bagnalstown to Wexford does not pay working expenses. Interest paid by Dublin and Drogheda and Great Southern and Western Companies. Any line in good credit can get its debentures out at $4\frac{1}{2}$ per cent.; 4957–4962. Preference capital of the Dublin and Drogheda; 4963.

PARKER, MR. ALEXANDER. (*Analysis of his Evidence.*)

Is a merchant in Dublin; 6864. Railways of Ireland are in a very unsatisfactory position as regards the shareholders; have been for the most part very unprofitable speculations; directors unable to venture upon any experiment, such as a bold reduction of the fares and charges; might be attempted by Government without much peril to the Exchequer. This would induce great masses of the people to travel, especially the labouring classes. All Irish railways give too little encouragement to third-class passengers. Return tickets are granted to first and second class but denied to third-class passengers. How Lord Dunsandle, when chairman of Midland railway, by putting on fourth-class waggons induced harvest men to make use of railway, and although population much thinned by emigration, receipts from this source have increased. Facilities presented by extremely low

PARKER, MR. ALEXANDER—*cont.*

fares induced people to emigrate. A trifling reduction would not be of much use, but a large and telling reduction would bring out such numbers as travellers that in two years there would be no diminution in the revenue. Does not lay much stress upon a large reduction in price charged for merchandise, as he does not think that it would largely increase traffic. Would join in pleading for Government interference in order materially to reduce present passenger fares, and considerably reduce charges for merchandise; would be extremely popular and a political, social, and great commercial advantage. Is of opinion that it would be a benefit to the country if Government would buy up railways. Directors would make reductions if prepared to run a risk for 12 months. Suggests that Government might guarantee railway companies against any loss below that which they may at present be incurring; 6865-6872. 6878. Is certain that if fares were lower persons who now carry on their business by correspondence would do so personally; 6873, 6874. At meetings of Irish railway companies very little union amongst shareholders, and very little cordiality between them and the directors; are generally an occasion for clamour for reduction of freight or passenger fares, but suggestion generally comes with a local bearing; 6875-6877. Present through-rate system operates to disadvantage of local merchant. States that goods can be sent cheaper from Liverpool to Cork, or from Liverpool to Limerick or Athlone, or to any of the inland towns more than 100 miles distant, than from Dublin. Difference paid to London by a Belfast and a Dublin merchant. Discussion thereupon. Generally speaking, English railway companies and Irish steamboat and railway companies are parties to through rates; 6878-6889. 6894-6899. Reduced rate would materially affect consumption of coal. Turf never very cheap and always an uncertain fuel. A dearth of good turf is nearly as bad as a dearth of potatoes. Railways carry coal at a very reasonable rate as compared with other merchandise, but high as compared with England. Was not aware that London and North-western carried coal for $\frac{3}{4}$ d. per ton per mile; 6890-6893. The Commission will be furnished with statements of some of principal rates charged; 6900.

PERRY, MR. HENRY ROBERT. (*Analysis of his Evidence.*)

Is a grain merchant in Dublin; 6817. Has given railway system of Ireland, in connexion with corn and flour trade, his especial consideration. Has always found companies disposed to extract extreme rate of remuneration for services performed, and was only by having Grand Canal that they have been kept from advancing rates still further. In 1860 Great Southern and Western and Midland Great Western promoted a Bill to buy up this canal, but failed; is now worked by original owners with great advantage to the district. Result of an agreement, confirmed by award, between these two companies entered into some years since, by which rates and fares fixed and healthy competition precluded, prejudicial to development of natural traffic and trade of the country, and calculated to retard materially commercial enterprise. How award arose, and matters which arbitrators were called upon to settle; reads the award, the result of which is that each company agreed not to compete with each other, but divide traffic in certain proportions, the object being to do away with canal opposition; no branch lines were to be promoted in a district which each considered as its own; 6818-6827. Rates for freight unequal, and considerably higher than the trade can afford; a moderate reduction would speedily induce an increased traffic over lines of greater part of Ireland; instances the low rates ($\frac{3}{4}$ d. per mile) in operation in Westphalia, which, so far from being unremunerative, have developed a considerable source of national wealth, and largely increased profits of railways. Rates for passengers and facilities afforded are not such as to induce travelling to an extent remunerative to the companies, the poorer classes for this reason rarely use railway to attend market, fairs, &c. Midland Company have set a good example by issuing market tickets. Hardly any points to which a third-class passenger can go and return on same day; at some points he cannot make even direct distance in one day. Branch lines worked by small companies prove a serious obstruction to traffic. Great benefit would arise if railways of Ireland could be worked as one general comprehensive system, and rates and fares lowered to a point analogous to those on the continent. Is of opinion that to make railways fully remunerative, rates they receive must be fixed in proportion exactly to circumstances of the country in which they are situate; 6828, 6829. If rates were lower

PERRY, MR. HENRY ROBERT—*cont.*

trade in grain would increase. In witness's district rates have been advanced since canal competition. Result of canal reverting to original proprietors has been that they have made an arrangement by which they compete at certain rates without conflicting, and rates of railways have been increased 25 per cent. in every particular instance since that occurred; 6830-6833. High rates for grain do not prevent speculation. A reduction of one-third from present rate for grain would be fair, and that, after the lapse of two years, would pay company. Would not be such an increase in grain as in other articles if rates were lower. Reduction would make a difference of about 5d. on the quarter; is certain that this would lead to an increased growth; many mills idle by reason of rates of freight rendering them not able to be worked profitably. Mentions one at Athlone, and states in what way additional charge of 5d. per quarter prevents that mill from working. 5d. per quarter on oats would allow a profit to the grower. Has made out a table, which shows that charges generally are not equal on railways, governing point being contiguity of the seaboard; for instance, between Dublin and Cork rates are less than to many stations short of Cork, and from Dublin to Belfast (113 miles) the fare is 10s., and from Dublin to Banbridge (87 miles) 15s.; 6834-6859. On Great Southern and Western, fares have been increased for some of the shorter distances in considerably higher proportions. Passenger fares have also been advanced 10 per cent. during past 10 years on both the Midland and Great Southern and Western; 6860-6862. Many of the smaller companies are burdened with capital by reason of difficulties in construction, consequently a large portion of capital is lost, and original shareholders receive no dividend. Reason why Streamstown and Clara line is not used; 6863.

PIM, MR. JONATHAN. (*Analysis of his Evidence.*)

Is a merchant and manufacturer in Dublin; in some degree firm are general merchants, but chiefly Manchester warehousemen, and cotton and linen manufacturers; 7050, 7051. A large reduction in rates would be a great advantage to the country. Attaches more importance to reduction in passenger rates than in goods rates, the former is less expensive traffic. As upon reduction there would be a deficiency in the receipts for four or five years, would not be warranted as a director in risking property of shareholders. Reason why experiment should be tried in Ireland; if successful should be extended to England. English railway companies might adopt it themselves; 7052-7058. 7062. 7065, 7066. Thinks difficulty not insuperable of getting rid of paid directors, and uniting companies in two or three large companies; 7059-7061. Large reduction in rates for coal would not be so great a benefit as reduction in passenger fares, as that would enable lower classes to travel upon railways; 7063, 7064. Would reduce rates to about one third of present rates. It would rather take ten years than five to recover receipts. Would then be no necessity for return tickets and excursion trains. How want of concert between companies affects passengers and traders. All ordinary trains in United Kingdom should carry third-class passengers; 7067-7076. Is a director of Dublin and Kingstown railway; whole of working arrangements under control of Dublin and Wicklow; 7077, 7078. Has not thought much about railways being purchased by Government; all new Irish railways should be made at their expense under some general system. Reads passage from Quarterly Review for 1839, predicting present evils. Believes state of things existing in England is very much the effect of amalgamation of the great lines. Mentions railways out of Dublin, and difficulties that arise from want of concert. Has heard of some attempts being made to amalgamate; knows they failed. If there were two or three great companies, it would lessen present difficulties very much. Train from Belfast came into Dublin too late to catch train to Cork, so that passengers could not make the journey in the same day. Was a mere matter of accident, but where different interests, companies often pull very badly together; 7079-7086. Several railways which do not pay in themselves, but which greatly benefit country through which they run; if fares were lower would benefit country a great deal more. Why not worth the people's while to reduce rates. The floating debt would be a difficulty. Line from Athlone to Castlebar and Westport only partially completed; paid a dividend of $\frac{3}{4}$ per cent.; as a proprietor would advocate reduction. Many of the great companies could try it, but are not willing, believing it would not pay. As to loss that would be likely to arise if suggested rate were adopted; would be

PIM, MR. JONATHAN—*cont.*

a diminishing sum each year. Receipts of first two or three years would show probable result. If unsuccessful would have to be given up. Instances success of Post Office. Some of the London companies have been compelled by late Acts to carry working men at low fares at certain hours morning and evening. Parliamentary trains generally put on at inconvenient hours for fear it should be made use of by any except lowest class. If fares were reduced many would travel second class who now go third, and first who go second; 7087-7092. Does not complain of the terminal charges, but complains of through-rate arrangements. Certain kinds of competition which companies ought to be prohibited from entering into. Labouring classes would travel much more if fares were cheap; their so doing would be a great benefit to the country; 7093-7098, 7103. Cattle and horses are driven by the road in consequence of the high rates by railway; 7099-7102.

ROE, MR. PETER. (*Analysis of his Evidence.*)

Has been manager of Midland Great Western, and of the Derry and Coleraine Railway Companies; 5725-5728. Became lessee of latter railway under Loan Commissioners. Circumstances under which it fell into their hands. Time witness continued lessee, increase in receipts, rent paid, expense of maintaining permanent way, and by how much gross receipts exceeded working expenses; 5729-5737. 5768-5777. Lease was annual, but liable to be cancelled at a week's notice unless railway kept in good repair, and a portion of the rent paid every Monday. When line given up, rolling stock was valued at more than at commencement of lease; 5738. 5791-5797. Transferred interest in lease to Northern Counties Company; 5739. 5844. During lesseeship reduced passenger fares one-half, and there was a considerable increase in receipts. Made similar reduction for goods and coal, the latter increased from 1,500 to 5,000 tons in the year; 5740-5745. 5874. Population of Londonderry and Coleraine. Reduced rates on third-class, and on all classes of goods to Newtown Limavady (a good intermediate town), and receipts of that station doubled. The increase of third-class passengers was remarkable. Introduced upon Midland the experiment of carrying harvest men (fourth-class passengers); increase of this traffic, and by what trains carried; 5746-5753. While manager of Midland, directors lowered rates a little; the result was beneficial to traffic. Never tried market trains on the Midland; tried them in the north, and got a considerable increase; 5754-5756. Directors of Coleraine line last year (the lease having expired) raised rates upon passengers and goods (coal excepted); trains are now half empty. Local rates much higher than through rate. Gives an instance. Cannot account for their raising the rates. Line now worked by the Northern Counties Company, who have assimilated rates between Londonderry and Coleraine to those on their own line between Belfast and Coleraine; 5757-5765. 5835. New line opened, giving another route to Belfast, which has taken a little of the through traffic from between Liverpool and Belfast, and Glasgow and Londonderry. When rates were reduced on Coleraine line, there was no reduction made on line from Coleraine to Belfast; 5766, 5767. When first connected with Coleraine line, gross receipts were not equal to working expenses, plus the Government interest ($4\frac{1}{2}$ per cent. on 80,000*l.*); claim the Government had to the rental; thinks that after they had been paid there was sufficient to pay the bondholders. Bonds from being a drag in the market at 5*s.* in the pound, rose to 20*l.* No dividend to original shareholders; they never expect any; 5778-5784. Will supply reports giving statistics from year to year; 5785-5791. Directors of Irish railways not much disposed to lease lines; would be advantageous to shareholders. Can say from experience that three practical men would be able to give results from any of the Irish lines far beyond what they are now doing; 5798, 5799. Many of the Irish lines are not paying their expenses; 5800, 5801. If lines were amalgamated and placed under one general management, and then leased to a few intelligent energetic men, results would astonish shareholders; expenses would be greatly reduced. If witness was one of the lessees of all the lines, would propose reduction similar to that made between Londonderry and Coleraine. Reason why reduction should be made in Ireland; 5802-5804. Tried reduction for six months first upon one or two sections; result so satisfactory that he made it general. No additional expenditure incurred, consequently there was an increase of profit; 5405-5410. Similar reduction applied to whole system of Ireland would not be followed by any loss; 5811-5812. Manufactories in Lon-

ROE, MR. PETER—*cont.*

donderry and Coleraine; the latter has become an important seaport. Condition of working population; 5813-5818; arrangement witness made for agricultural labourers on Coleraine line. Accommodation that should be provided if rates low for third class; 5819-5826. 5879-5883. Would divide Ireland into three districts; it would be an extensive undertaking even for three to manage; 5827, 5828, 5843. Travellers going from west of Ireland to the north are stopped at Cavan, and compelled to rebook there, and wait three or four hours; 5829. Desirable to have a central station at Dublin. There is an Act for it; 5830-5832. No difficulty in getting persons to lease lines on terms remunerative to themselves and beneficial to shareholders; 5833, 5834. Receipts of Londonderry and Coleraine line fell off last year 2,000*l.* upon 10,000*l.* Loan Commissioners have been paid their debt. Railway now the property of the bondholders; 5836-5838. 5871-5873. No other company have tried the experiment of lowering rates metrically. Objects to plan of meeting loss in the agricultural districts by getting a very high profit in the more densely-populated part; 5839, 5840. Amalgamation would improve present value of property as far as shareholders are concerned. Working system under one management would be a great advantage, as there would be uniform rates and a continuous communication kept up; 5841, 5842. Explains why, when the Midland was once leased, the receipts were unsatisfactory; 5845-5848. Seven-eighths of the whole traffic from north to south of Ireland pass through Dublin. Reason why another communication is needed; 5849-5852. Has been engaged in agricultural pursuits since ceasing to lease the railway. Has found as a merchant great cause of complaint of the rates, especially to the west and north-west. States situation and nature of his business. Has made complaint to the company of the high charges; in some cases quite prohibitory. Charge to Galway for such articles as washing soda, rough sulphur, coppers, &c. was 50 per cent. on the first cost value. Gives an instance of the excessive charge made for carrying American oil; 5853-5862. 5865-5867. Internal traffic affected by high rates. Complains that goods from Manchester and Wigan are booked through to Limerick, Ballinasloe and Kilkenny upon such a toll and same rate as is paid for them to Dublin; 5863, 5864. Does not think there is a limited quantity of traffic, and that railways get nearly the whole of it, and consequently any reduction in rates would be so much less money. Sent goods last week by road; frequently cheaper to use the road. Mentions a case where, by reducing the rates, carmen were driven off; 5868-5870. 5884-5891. If rates were reduced, consumption of coal would considerably increase; if it could be brought into Dublin at 11*s.* or 12*s.* per ton, and sent into interior at the rate of $\frac{3}{4}$ *d.* per mile, it would be cheaper than turf. Witness imported coal, and gave the station master a commission to dispose of it; 5875-5877. Considerable reduction in price of coal would encourage manufactures in Ireland; 5878. No regular carriers between Dublin and certain other towns; cheap communication by canal. Arrangements between railway and canal; 5894-5898. Low rates to and from Carlow would produce a considerable amount of traffic; butter and potatoes might be sent from there to Dublin if rates were low; 5899-5902. Not the same necessity for low rates in England; are generally lower than in Ireland; 5903, 5904.

See also COTTON, E. J., Esq.

RYAN, MR. MICHAEL ROBERT. (*Analysis of his Evidence.*)

Is a merchant of Limerick, and member of the Chamber of Commerce; 2651, 2652. Present passenger rates prevent traffic, and better arrangement required as to keeping time for the third-class passengers between principal lines and tributaries; gives instances of the delay and inconvenience to the public. Thinks Government should buy up all railways, especially small and non-paying ones; 2653-2658. 2683-2684. Traffic between Limerick and Dublin diminished in consequence of delay. A large class would travel to Dublin and Cork if they could return same day; formerly they could do so. The company charged full fare. Describes class who travelled by the train; 2659-2677. Impediments in the way of third-class travellers mainly attributable to number of small companies and conflicting interests; 2678, 2679. The Great Southern and Western tried last session to buy or lease the Limerick and Castleconnell line, but the Bill was lost; 2680, 2682. Railways about Limerick not doing the work of the country; carriers numerous on the road. Directors should try, by reducing rates, to obtain cattle traffic; believes traffic would pay; 2685, 2686. Many passenger trains empty; with

RYAN, MR. MICHAEL ROBERT—*cont.*

lower fares, traffic (especially third-class) might be considerably increased; many walk or drive instead of using the railway. The Limerick and Foynes Company and the "Kelpy" steamer in connexion with Foynes line, increased rates 10 or 12 per cent., and there was a considerable decrease in the number of passengers and receipts; 2687-2696. 2699-2702. 2734-2740. 2785-2791. Very rarely passenger fares for market days. Several fairs are held at Rathkeale, but railway arrangements such that only half an hour can be got to transact business in the town; 2697, 2698. Shareholders have remonstrated against present management, but as all local lines are in the hands of one party they are powerless; 2703-2708. The putting on of a later third-class train from Limerick to Dublin would be profitable to company, and would not affect the second-class trains; 2709, 2710. The custom of hucksters going through the country buying up the produce would be altered if rates were reduced. Mode adopted by railway company in Tipperary district. Proceeding discourages trade from Limerick and favours Waterford. Freight cheaper from Shannon, by sea as compared with Waterford; 2711-2733. Complaints at Bruree (where there is a very large flour mill) that coal traffic is encouraged at the expense of turf; gives relative rates; question discussed; 2741-2751. 2755-2765. Turf more suitable than coal for dairy purposes; 2752-2754. Thinks directors of Great Southern and Western Railway are large shareholders in steamboats; 2766, 2767. Is not aware that there is a maximum charge in Railway Acts beyond which companies cannot go; 2768. All railways should be placed under one management. Directors at Waterford, Cork, and Dublin vie with each other to get the greatest loading for their steamers, and port of Limerick does not get a fair mileage in consequence; 2769. States that Sir David Roche, owner of a large flour mill near Limerick, suffers much inconvenience from high rates; 2770-2775. Would like to see the Government take all Irish railways, and try the experiment of having one central management; discussion as to how loss should be met; 2776-2780. 2793. There would be an increase of the produce of the soil if rates were lower; 2781. Does not know the rates by Bianconi's cars before introduction of railways, but since rate increased shares have depreciated and dividends diminished; 2782-2784. Mentions a case of inconvenience to emigrants in consequence of there being no third-class train; 2792.

SHAW, MR. THOMAS. (*Analysis of his Evidence.*)

Is traffic manager of the Irish North-western railway; 8268. Although traffic receipts are much improved this current half year, position is not flourishing; gives cause and amount of increase; preference and ordinary shareholders are receiving nothing; 8269-8271. 8349-8352. Length of line, and cost per mile; railway was made by share capital; gives cost, and explains that the sum is only for a portion of present line; pays 500*l.* per week for other portion. Obligations to be discharged before ordinary shareholders are paid a dividend; working expenses of line; 8272-8293. 8401-8407. Names companies that have joined Irish North-western Company in the subscription to the Cavan and Clones line; works in harmony with them. Difficulty in booking through between Irish North-western and Great Southern and Western lines; 8294-8300. Passenger traffic principally third-class; goods traffic, agricultural produce and such goods as agricultural people require. Thinks if rates were reduced for long distances, traffic would increase; has tried experiments, but, with one exception, not successful. Has remodelled cattle rates, but in consequence of bad seasons, traffic not so good as it was three years ago; 8301-8307. 8317-8321. Reason why line does not pay a dividend. Gives number of trains per day; 8308-8316. 8332-8344. Is not aware that they have ever received a proposal for preferential rates; no reason to suppose that traffic is kept off line by present rates. Do not, on principle, make preferential rates; 8322-8325. Carry a great deal of coal, considering that there are no manufactories upon the line; the traffic seriously interfered with by local bogs; 8226-8229. Has through booking from most of their stations; books with London and North-western both for passengers and goods; 8329-8331. Has severe competition with the Ulster Company; rates by this company rather higher; 8345-8348. 8387-8391. Thinks the directors take as much interest in this railway as those of more profitable lines. Directors have great hopes that matters will improve; 8353-8356. Would be an advantage to public and to proprietors if all lines north of Dublin were amalgamated; fares would not be raised, but railways would be worked more economically, would be a better

SHAW, MR. THOMAS—*cont.*

communication between Dublin and witness's district; reasons why service not so good as it should be. Would not go further south than Cavan; 8357-8367. 8374-8385. Effect that amalgamation would have upon the different ports; steamboat communication would greatly affect traffic to any port; 8368-8373. No competition between Clones and Belfast; passengers go now by Ulster line; 8386. Irish North-western does not communicate with any line at Londonderry; if it did, would get some flax traffic; this traffic was carried by Northern Counties line until Omagh junction was made. Northern Counties pay about 800*l.* a year to Irish North-western Company; 8392-8400. Directors of Irish North-western line elected by the ordinary shareholders; hands in a list, and states that 12 directors manage whole system (145 miles); 8408-8412.

SHAW, WILLIAM, ESQ. (*Analysis of his Evidence.*)

Is director of a bank, and of a flax spinning company; resides near Cork; 6382, 6383. Cork and Bandon Railway not managed with profit to shareholders or advantage to the public. Line made at great cost. Directors and shareholders have not much interest in increasing traffic. Line in hands of preference shareholders. Supposes directors and preference shareholders hold original shares; 6384-6386. 6393-6396. Traffic in agricultural produce might be more developed if rates were lower, and better facilities afforded for bringing to market; 6387-6389. Thinks if line were leased it would be worked with profit, and traffic largely increased. Some extension lines in the course of construction. Cork and Bandon Company have impeded construction of further extensions; 6390-6392. Cost per mile for making line; is carried through a country giving hardly any business. Difficulties in making line. Money wasted in engineering and law expenses. Engineer incompetent; 6397-6403. Amount of interest paid to preference shareholders; there are two classes, on one interest has been regularly paid, but not on the other. Motive for managing railway better. Ordinary shareholders have no hope of getting much out of line. Not sufficient speculative spirit in the country to buy up the ordinary shares, and get efficient officers to manage railway profitably; 6404-6411. Rates could not be reduced to any great extent on Cork and Bandon line, but better system of return tickets, excursion trains, &c., would develop business upon it. It would be too great an experiment to reduce 20 per cent. In England, reduction increases business, not so in Ireland. Would look to increase more by a better system of looking after traffic; 6412-6414. Rich agricultural district lying to west of Bandon; a great deal of produce now sent by cart would go by railway if rates were lower, and business looked after; 6415-6421. Is not aware that an experiment for making a great reduction in charges has been successfully tried on Coleraine and Londonderry line; different country from Cork and Bandon line. Moderate reduction would tell, both in goods and passengers. Gives length of line, and number of persons to manage it; 6422-6427. Bandon Company work a little branch line to Kinsale; get 30 per cent. of gross receipts for three years; 6428, 6429. Would be an advantage to amalgamate Cork and Bandon line with Great Southern and Western, as trains would then be arranged in a proper manner, and economy effected in management; 6430-6432. Cheaper to send flax from Bandon to Belfast by way of Liverpool, and re-ship it there for Belfast. Much traffic lost for want of proper system. Freight paid from south of Ireland to Belfast, and distance by railway. Ten years ago there was rather a large quantity of flax sent, and it is expected there will be again. Will in time be sent in sufficient quantity to make it a remunerative traffic. Hopes flax will be continued to be grown in south of Ireland. Is a remunerative trade; requires much rain; is generally grown in west part of county of Cork. Would send flax to Belfast by railway if rates same as round by sea. Mileage rate by water; cannot give railway rate; 6433-6450. Vessels never go direct from Cork to Belfast; not enough traffic to load them. Continuous railway communication (except break at Dublin) between Cork and Belfast. Thinks goods are not sent by way of Tullamore and Mullingar; would be an intricate way. No through communication from Bandon to Dublin by that route. Has transhipment and carriage across the city, which adds to the expense. As stations are nearly opposite each other, might be possible to establish a ferry; goods would then have to be carted to the ferry; the rails might be brought down to it, if the Commissioners of Cork gave their consent; 6451-6460.

SULLIVAN, MR. WILLIAM KIRBY. (*Analysis of his Evidence.*)

Is professor of chemistry to the Museum of Irish Industry; 1925. Has directed his attention to Irish railways generally, and to the transport of mineral products specially; 1926-1928. High rates and fares charged in Ireland are injurious to trade, and a reduction would greatly benefit mineral and agricultural produce; gives opinion as to results that would follow such reduction, and quotes rates charged by the Dublin, Wexford, and Wicklow Railway Company to the Wicklow Copper and other mining companies; rates in some cases 50 to 72 per cent. of the total value of the produce; 1929-1939. 1944-1950. The mining company have complained to the railway company of their high rates, but no reduction made. The mining company pays a high dividend,—the railway company 4 or 5 per cent.; 1940-1945. Limits of production in mines referred to will not be reached for many years, and were rates reduced the quantity of ore sent would be trebled. Thinks iron ore could be sent by ship for 3s. per ton at a profit; 1951-1953. Difficulties in the way of mining company's making a branch line to one of the railways; 1954, 1955. Particulars of market value and cost of raising certain ores; 1956-1971. If coal could be had at a moderate price the ore would be made into oxide; most of the ochre found runs into the river; 1972-1974. If the ore had been carried at half the rate it would have yielded a profit of 5 or 6 per cent. to the mining company, and slightly increased the dividend of the railway company; 1975-1977. The working expenditure on the Waterford and Limerick line for part of 1863 was 301.39L.; 1978, 1979. If rates were reduced one half, mines should contract to send a certain quantity, and inasmuch as the railway would carry full loads and bring back coal, there would be no additional expense; 1980-1984. By having a railway wharf at Limerick the ore could be sent at a reduction of one-third. Is not aware of any wharves having been proposed at Waterford, Cork, and Limerick; 1985-1987. If railways to the south of Ireland were amalgamated, it would pay to make a branch to the mines; saving that would be effected; 1988-1990. Inexpedient for Great Southern and Western to carry the ore to Cork, with a view of shipping it. Reasons why railway have never proposed to mining company to take their ores to Dublin; 1991-1994. Sulphur chiefly exported to Liverpool; route by which it might be sent; 1995-1997. Reasons why rates for minerals are higher on Irish than on English lines; 1998-2000. Waggon's always found by the Irish railway companies; 2001. Port of Wicklow better than Arklow; 2002, 2003. Before railway constructed sulphur was carried by ship. Competition in sulphur; supply from Sicily diminishing; large chemical trade carried on in pyrites (from which sulphuric acid is made), used in the large bleaching works in Dublin; 2004-2010. A large district at Boyle containing iron ores and a coal-field not worked in consequence of the high rates. Unsuccessful attempt made to send clay and ironstone of superior quality to England; 2011-2015. Communication between railways of Dublin and quays will remove objections. Difficulty in getting several boards of directors to agree to any change; 2016-2018. Steady decline in passenger and goods traffic in proportion to increase of mileage upon all the Irish lines, which may be attributed to high rates; conflicting opinions prevent reductions; 2019-2026. 2048. Wicklow line have reduced rates, and contemplate a considerable further reduction; 2027-2030. Difficulty of dealing with various interests might be obviated by having one central administration for Ireland. Upon reduction of fares there would be a temporary loss, but this might be met by a decrease in expenses; 2031-2033. Cost of management not large, and traffic as a rule well conducted; quotes working expenses; 2035-2039. Possibility of as great a development of passenger and agricultural traffic as of mineral; good results that would follow reduction shown; rates for passengers and for certain agricultural produce; 2040-2047. 2049-2073. Unequal rates between town and town. Goods can be sent from Dublin to Belfast (111 miles) cheaper than to Newry (70 miles), there being competition by sea to Belfast; rates to Belfast profitable to company; earnings on certain lines; 2074-2082. Rates unequal on the Cork and Limerick line when there is no sea competition; charges to different places for butter, coal, and turf; 2083. One source of increase of traffic in Ireland will be from coal; in 1825 it was 750,000 tons, it is now more than 2,000,000, and witness estimates that in 4 or 5 years it will be 4 or 5 millions. Thinks consumption of turf will increase, and that it will rise in price; one ton would occupy the space of six tons of coal; 2084-2089. If rates were

SULLIVAN, MR. WILLIAM KIRBY—*cont.*

reduced there would be an increase in the cattle trade. No cattle now carried on the Bandon line, rates having been raised. Particulars of practice adopted by the Great Southern and Western Company, as to rates for carrying cattle and fish. Desirability of passenger half-fares; 2090-2096. Believes traffic has not decreased upon the substantial lines. Decrease attributable to undeveloped branches; 2097, 2098. Cattle traffic between Navan and Dublin, &c.; variation of rates; 2099-2101. Cattle rates not reduced on the branches to Belfast, Newry, Dundalk, and Dublin; on one they are increased. Cattle to be profitable must be carried at low rates; 2102-2106. General feeling that it would be advantageous to place all the lines under one management. Good effects would follow amalgamation, even if rates were not reduced. Thinks same principle should be applied to railway traffic as is applied to the valuation of land in Ireland; mode of application; discussion of this question; 2107-2119. Reductions which are necessary for development of coal traffic; 2120. Growth of flax, especially in the Midland districts, might be stimulated by low rates; disadvantages under which the cultivation labours; 2121, 2122. Reasons why amalgamation into one company would be beneficial on the future extension of the railway system of Ireland. It might be advantageous to a district if two lines competed for a certain time and then amalgamated, as in the case of the Grand Canal; 2123-2127. Undue pressure of cost of carriage upon the poor lands of the Irish farms; 2128. A fat bullock can be conveyed from Normandy to London for less than from Limerick to London; 2129. Recent case of a large agriculturist making arrangements to drive his cattle to Dublin rather than employ railway; 2130-2133.

TINSLEY, MR. JOHN RICKARD. (*Analysis of his Evidence.*)

Is mayor of Limerick, and connected with the Chamber of Commerce; 2308, 2309. Attention of Chamber has been called to the railway accommodation and fares; 2310, 2311. Witness complains that the high fares prevent intercourse with the western districts. General opinion that traffic would be increased by a reduction; 2312-2315. Gives fares between Dublin and Limerick, and states that the number of trains is insufficient; 2316-2343. Intercourse between Dublin and Limerick would be increased were facilities afforded. Considerable communication between Limerick and Cork, the trains being more convenient; 2344-2349. Accommodation more easily arranged if matters were in the hands of one company; 2350. Between Limerick and Waterford the trains are sufficient, there not being much passenger traffic. It is a cheaper route, but the sea passage is longer; 2351-2354. Merchants and traders require more accommodation. Retail traders deal with wholesale merchants in both Limerick and Dublin. Population of Limerick 50,000; 2355-2359. Great trade in cattle between Limerick and Dublin, principally by railway; 2360-2362. Many travellers come to Limerick from Dublin wholesale houses; 2363, 2364. Fares are much too high between Limerick and Dublin; upon reduction, traffic in passengers (especially third-class) and goods would increase. The larger proportion would be from Limerick; class of persons likely to travel; 2365-2382. Companies do not run excursion trains on market days, or issue third-class return tickets; 2383-2385. Steamboats on the Shannon are crowded in summer. Distance and fares to Kilrush. Not much traffic to Foynes; 2386-2392. First-class return tickets are issued. Reasons why they are of no practical use; 2393-2398. Three years ago the fares were increased; 2399, 2400. Lines of communication between Limerick and England; 2401-2409. Complaints in Limerick as to charges for goods. Within the last two or three years rates for certain goods have been increased 80 to 100 per cent. Traffic fallen off in consequence. Persons sending goods have to insure against sea risk; 2410-2415. Describes certain routes from Limerick to Liverpool, and rates charged by each; 2416-2427. Discussion as to how far charges interfere with trade of Limerick; 2428-2458. Particulars as to the Limerick Steamship Company; they were threatened with opposition by the railway if they did not increase their rates; 2439-2454. 2458-2462. Witness is an import merchant at Limerick; sends his goods by steamers; 2455-2457. Advantage to railway companies of steamboats raising the rates; places from which coal is brought to Limerick, and rates of charge; 2465-2481. 2523-2536. Distance between Liverpool and Dublin, as compared with distance between Liverpool and Limerick, less than half. Gives rates for coal by certain routes; 2481-2490. 2496-2506. Does not know whether railway companies stated old rates to be unremunerative; 2481.

TINSLY, MR. JOHN RICKARD—*cont.*

Charge for goods from Dublin to Liverpool less by canal than by railway. Differential rates settled by canal company in concert with railway company; 2491-2495. Turf is not used in Limerick so much as formerly, it is scarce and dearer. When price above 3s. 6d. a horse load, considered dearer than coal at 20s. per ton; is now 4s. Thinks consumption of coal will increase. 10 or 15 miles from Limerick turf would be cheaper. A great deal comes from Kilrush and by railway from Castleconnell; 2507-2522. Advantages given to Waterford in consequence of the rates being lower in proportion to Tipperary than from Limerick to Tipperary; 2423-2536. Quantity of coal brought to Limerick would not be equal to the consumption. Coal has to be carted from the ship to the railway, and cost added to freight; 2538-2546. With exception of coal, has no further complaint to make against railway companies; 2547, 2548. Places in the interior to which salt is sent; 2549-2551. Enumerates commodities which would be brought from the interior to Limerick upon reduction of rates, and states that coal would be carried further into the interior than at present, and in what direction. Believes it would come into competition with turf; 2552-2571. Large cattle trade from Limerick, which would be increased if rates were lower. Very little mineral produce near Limerick; 2572-2578.

TINSLY, MR. JOHN RICKARD—*cont.*

Flax manufactured in Limerick, but produce not increasing. Very little brought into Limerick by railway. Manufactories worked by steam power. Water power of Shannon principally used for corn and flour mills; 2579-2586. Would have railways amalgamated under one Government board, who would make uniform rates according to mileage. Discussion as to how board should be constituted, the rights of shareholders preserved, and loss, if any, met upon a reduction of rates, and also as to choice between a local and Government management; 2587-2590. 2594, 2600-2616, 2621-2643. No difficulty in booking goods through to different ports in Ireland. Scarcely any trade with the north; 2591, 2592. Is in favour of competition, not combination; 2593. In contemplation to take railways down to the river wharves. At Waterford the railway is in communication with water. All trains (except mail train) from Limerick to junction lines correspond with South-western down trains at junction; 2595-2599. On some railways scarcely any profit; the Foynes and Limerick is a very bad line; 2617-2620. People of Limerick would rather submit to present rates than have to make up deficiency caused by reduction; 2644-2648. Unfair to tax a district; nor should the whole kingdom be taxed to benefit Irish railways; 2649, 2650.

EVIDENCE AND PAPERS.

Friday, 5th May 1865.

PRESENT :

THE RIGHT HON. THE EARL OF DONOUGHMORE.
 THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
 THE HON. E. F. LEVESON GOWER, M.P.
 SIR ROWLAND HILL, K.C.B., F.R.S.
 J. A. ROEBUCK, Esq., M.P.
 T. B. HORSFALL, Esq., M.P.

ROBERT DALGLISH, Esq., M.P.
 GEO. CARR GLYN, Esq., M.P.
 CAPT. DOUGLAS GALTON, R.E., F.R.S.
 E. T. HAMILTON, Esq.
 J. R. M'CLEAN, Esq., Pres. Inst., C.E.
 WILLIAM POLE, Esq., F.R.S., *Secretary*.

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

WILLIAM THOMAS MULVANEY, Esq., examined.

W. T.
 Mulvaney, Esq.
 5th May 1865.

1047. (*Chairman*.) You were formerly, I believe, a Commissioner of Public Works in Ireland?—Yes.

1048. For a considerable period of time?—I was in the Government service altogether about 27 years.

1049. How long is it since you ceased to be a Commissioner of Public Works?—Since the year 1852.

1050. Since that time, I believe, you have been resident in Prussia?—Yes, since 1855.

1051. How have you been occupied there; what was your object in going there?—I was owner of a part of two large colliery concessions there, and had the sole management for my partners and myself.

1052. In what part of Prussia were those collieries?—Westphalia is where the collieries lie, but I live in Dusseldorf.

1053. Has your attention been called, both in Ireland and in Prussia, to the railway system generally?—In Ireland it was constantly, in my early official capacity, not directly with the original Railway Commission, but the members of the Railway Commission were at that time Sir John Burgoyne and others with whom I was connected in office, and subsequently Sir John Burgoyne became Chairman of the Board of Public Works, of which I was a member, and we therefore had very much to do in connexion with the question of railways generally in Ireland. Afterwards I proposed the construction of the Midland Great Western of Ireland Railway, and recommended to the Government the granting of a loan for that portion of the line which extends from Athlone to Galway, with a view to develop the resources of the west of Ireland, which at that time contained about three millions of inhabitants, but now considerably less.

1054. In what capacity did you recommend that?—As a Commissioner of Public Works.

1055. What was that commission on Irish railways of which you have spoken?—A railway commission appointed by the Government before the construction of railways in Ireland to investigate the best system on which railways should be constructed. Mr. Drummond, who was then Secretary of State for Ireland, was, I believe, the chairman of that commission, in 1837 or 1838, I think. I had afterwards, following your Grace's question, to give evidence on Lord Granville's commission as to the packet stations in Ireland, and on that occasion I devoted much attention to the railway systems in Ireland, and the connexion of the railways with each other and with the harbours, especially in Dublin.

1056. Your attention has been also called to the railway systems in Germany?—Yes; and there it was called to them in my own interest in connexion with the collieries which I have mentioned. My partners and I being strangers in the country, and having commenced the working of the collieries in the midst of 200 or 300 existing collieries, the necessity arose to find markets for our produce, and we resolved at an early period to seek the most distant markets, where we would come least in competition with the existing collieries. At that time, owing to the high rates for the transport of coal, coal did not go by rail much more than about 10 German miles, which is about 47 or 50 English miles, taking a radius from the centre of the coal district of Westphalia.

1057. Was no coal carried further than 50 miles?—Not much by railway, the prices were so high, but

by water; it did go by the Rhine. Afterwards, in consequence of a reduction of the fares, obtained after a long struggle, we were able to send it, and the coal goes at present about 100 German miles, or rather over 100 German miles, something more than 500 English miles.

1058. Was that entirely owing to a reduction of the charge that had previously been made?—Quite so; it was impossible before; the rates were so high that the coal from Westphalia could not reach those distant districts; the price exceeded what the coal was worth, and it could not compete with the English coal on the sea coast, or with the coals, and wood, and turf in other districts. The agitation or struggle that was made for this reduction I believe will be a matter of interest to the Commission, inasmuch as the difficulties existing in Germany even surpassed those which might be supposed to exist in Ireland. The various number of small states and governments existing in Germany, in addition to the various number of railway companies, rendered any co-operative action for a common object excessively difficult. The arguments that I was enabled to bring forward were chiefly from England, where, in the matter of mineral traffic, they had made a very considerable advance as compared with that the Continent had made. I visited most of the governments and the ministers of commerce of each of them, in conjunction with a deputation of the coal owners, for the purpose of arguing with them and convincing them of the advantages that would result to the railway companies themselves from a reduction in the freights, and especially for fuel. We were met constantly with the argument, that the circumstances in Germany were different from what they could be in England; and there was a disbelief, in fact, on the part of the ministers of Prussia that such rates, that is, a halfpenny per ton per mile, could exist in England. I was compelled, in consequence of this, to collect from our blue books and from friends the actual state of facts, and I wrote a small *brochure*, which was handed about, and at last, with the assistance of professional men in Germany, we were able to state to most of the railway boards, that the original cost to them of the carriage of coal could not materially exceed a farthing a ton per mile, and therefore if they assented to the proposition which we made (it would be in German money one pfennig per centner a German mile), which is somewhat less than a halfpenny a ton per English mile, they would have a fair profit. Having made these statements, and sustained them by proofs from England and by communications from the German authorities, there was a disposition to go into the matter, but I should have failed had it not been for the assistance afforded to me by the manager of the Dutch-Rhenish Railway, from Amsterdam and Rotterdam to Germany. This gentleman was an Englishman, Mr. Forbes, now general manager of the London, Chatham, and Dover Railway, and the company being for the greater part English, the majority of them were more open to conviction on such a matter. Their shares were at a very great discount, they had no coal trade, but they had a number of coal waggons. Mr. Forbes entered with a full and liberal spirit into an arrangement with me, and placed the waggons of their company at my disposal, provided that we sent regularly given

quantities into Holland at our own risk, and at the low rate that I have mentioned. We had a difficulty still; our collieries were on the side of a German railway, and the coals had about 50 miles to travel before they reached the Dutch-Rhenish Railway. Owing to the Dutch-Rhenish Railway Company giving their waggons and entering into such an arrangement with me, we temporarily got a rate from the Cologne and Minden Railway on which our collieries lie to make an experiment, and we ran for a year or two.

1059. (*Mr. Roebuck.*) Those 50 miles which you have mentioned were German miles, I suppose?—No.

1060. Your coals had to run 50 miles before they reached the Dutch-Rhenish Railway; were those 50 German miles?—Fifty English miles, about 10 German miles; the whole distance to Amsterdam was about 125 English miles, and the distance to Rotterdam (the sea ports and termini of the Dutch-Rhenish system) was 136 miles, I think. So far we made the experiment. I brought these facts before the North German union of railways. I may explain to the Commission that some of the difficulties in Germany with regard to the various governments and various railway directions are got over by forming a union of railways for the common through traffic. We failed in succeeding for a year or two to convince the North German union, which included the kingdom of Hanover and Brunswick, which lie between the two divisions of Prussia, until we finally effected the object in this way. Thirty-two collieries entered into a guarantee to deliver, I think, 25,000 tons within one year at Magdeburg on the Elbe, at the rate that we had proposed, subject to a penalty, in case we failed in sending that quantity regularly, of a very heavy fine, I believe equivalent to the original freight, and I may state that the original freight was very high.

1061. (*Chairman.*) What was that original freight?—I cannot give you the figures at the present moment. For experiment I sent two waggons of 10 tons each of our best coals from our own colliery to Magdeburg; it was allowed to be fully equal to and was purchased at the same price as the English coal, but instead of my receiving anything back for the two waggons, I had to pay 2*l.* in addition for the freight: the original freight I have not got.

1062. It was very much higher I presume?—Yes; it was quite prohibitive. We succeeded in the experiment, but mainly by the fact of our collieries supplying the quantities at a risk when many of my German neighbours fell off in their deliveries, and the burden fell for the greater part on our own shoulders. We succeeded from that day forth, and the advantage of a low freight was proved in North Germany, and it has worked with extraordinary success since. But to illustrate the difficulties, the kingdom of Hanover which has railways chiefly managed by the State, and at the same time is the owner of collieries, interposed, at least on the part of the State, more than on the part of their railway board, very considerable difficulties, and for a full year all that Hanover would concede was to allow the coal to run through the kingdom to the opposite side of Prussia, but it would not allow any to be delivered in Hanover itself.

1063. (*Lord Donoughmore.*) Can you say when these low rates were introduced?—It was in the year 1860. In the middle of 1858 I commenced to produce coal, and our agitation began immediately, and I think the experiment was made in the year 1860.

1064. (*Mr. Horsfall.*) For what distance can you now run at the low rates?—To Munich, to Switzerland, and to Berlin, about from 75 to nearly 100 German miles.

1065. (*Chairman.*) That is about 500 English miles?—Yes.

1066. (*Mr. Horsfall.*) Did all the railway companies agree to take it at the same rate?—That was

the very difficulty which is not yet overcome. The various branches of the railway systems in Germany have not yet come fully into the arrangement. There are various state jealousies and various jealousies between the various railway companies which have prevented it.

1067. (*Mr. Glyn.*) The rate is rather less than a halfpenny per ton per mile, is it not?—It is. The halfpenny per ton per mile would be a fraction more than one pfennig per centner per German mile.

1068. Did you find your own waggons?—No; the waggons are found by the railway companies.

1069. That is rather less than the English rate, is it not?—Yes; but I should observe, if you wish to go into detail, that they also charged for terminals, in some cases 3*s.* a waggon of five tons at each end of the system, whatever it was. This was a fruitful source of jealousy, because the station from which the mineral went, or the railway from which it went, to the railway on which it arrived had more benefit from the transport than the country through which it passed without stopping.

1070. (*Chairman.*) Are you still working your coal over the Dutch-Rhenish line?—Extensively.

1071. Can you state whether the result has been satisfactory to the railway companies as well as to you?—The result to the Dutch-Rhenish has been extraordinarily good. The Dutch-Rhenish line was formerly supplied from England, and as Rotterdam and Amsterdam are the nearest ports to England, they received a supply; they commenced, however, encouraging the system of taking the coal from Germany for their locomotives, by which they at once got a steady supply and a regular supply, weekly or daily, as they required it, and they were enabled to save a large outlay in storing up coals that should arrive by ship; they used coal instead of coke, and they effected a great saving in locomotive power thereby; and from having no trade whatever in coal over their line they arrived last year at 147,000 tons from Germany alone over their line.

1072. (*Mr. Glyn.*) All these contracts were founded upon quantity, I suppose?—They were founded upon the regular through running of trains with a minimum quantity of 200 tons in Holland, and we can load or send 400 tons in Germany.

1073. (*Lord Stanley.*) You have given us the actual rate charged, but you have not given us the amount of reduction which took place?—I have stated that I am at a loss to give you the precise tariff, but all that can be supplied to you.

1074. Can you tell us roughly what it was?—It was prohibitive, and where no coal then went there is now a very large trade.

1075. What we wish to know is, what was the amount of the tariff which was prohibitory?—I will take Berlin as it is now. To reach Berlin with this new tariff and with the two terminals we could not compete with England, so that the 3*s.* that was charged for terminals at Berlin was obliged to be given up. I have already stated the fact of the coal that I sent to Magdeburg returning the coal owners nothing, and having to pay in addition.

1076. (*Mr. Dalglish.*) What is the distance from the colliery to Magdeburg?—About 54 German miles, or about 250 English miles.

1077. (*Chairman.*) Should you imagine that the old charge was three or four times as high as the present one?—I will supply the facts; I do not remember.*

1078. (*Mr. Dalglish.*) You stated, I think, that you sent two waggons with 10 tons each?—Yes.

1079. Do you know what they sold for at Magdeburg?—No; it is several years ago.

1080. (*Captain Galton.*) You said that English coal could compete with you at Berlin. How does

W. T.
Mulvaney, Esq.
5th May 1865.

* The rate, I have since ascertained, was 30 thalers 10 silver groschen for five tons, or about 18*s.* 3*d.* per ton, being rather more than the selling price of the coal there in former seasons.

W. T.
Mulvaney, Esq.
5th May 1865.

the English coal reach Berlin?—It reaches Berlin through Hamburg and through Stettin.

1081. From Hamburg how does it go to Berlin?—By water, by canal; it could go by railway, but it goes chiefly by water.

1082. (*Mr. Hamilton.*) Are the present rates still conditional upon your supplying a certain quantity to the railways?—Yes; they are still conditional upon our sending full trains to run through from station to station. That was my own proposal founded upon the English practice, as I knew thereby that the railway could have a very large profit at a low freight.

1083. (*Mr. Glyn.*) When you say through trains, can you tell us the number of tons or thereabouts?—A train load is 200 tons; that was the minimum for each train.

1084. (*Sir R. Hill.*) To whom do the railways in question in Germany belong?—In Prussia a number of them belong to the State; part of them belong to the different states. Most of them through Hanover belong to the Government of Hanover, and in Brunswick to the Government of Brunswick. The Prussian railways in that line are all private.

1085. (*Chairman.*) The Dutch Rhenish Railway is private, is it?—Yes, it is chiefly English.

1086. (*Mr. Glyn.*) In this union of railways in North Germany who fixes the rates, does the union fix them, or is there a committee that fixes the rates, or do they make their own separate rates?—The union consists of various boards united together, and they have frequent meetings—I think monthly—and general meetings of the deputies from each board, and one great meeting yearly.

1087. Do they fix the rates?—Yes; they fix every through rate.

1088. Irrespective of the boards themselves?—Yes; they are deputed by the boards.

1089. They can fix the rates?—Yes, for through traffic.

1090. For the whole of the Union?—Yes.

1091. (*Chairman.*) Are you still proceeding in extending the system, and carrying your coal at low rates over the other German railways?—It is itself spreading; since the seed was sown the fruit has been obtained, and large profits direct and indirect arising to the railways, they have themselves extended the system.

1092. Is the German Union satisfied with the results?—I have only, as yet, spoken of one; there are several German Unions, and there are classifications of railways in unions according to local circumstances.

1093. Those systems, now that the experiment has been tried, are satisfied with the result?—They are so important to the country; first to the trade, and, secondly, to the railways, that you will, perhaps, permit me to give you the figures. In the year 1859, taking the Westphalia coal districts, when the low fares first came into operation at all, the Westphalian districts produced 3,800,000 tons of coal. In the year 1864 they produced 7,500,000 in round numbers, and a totally new life has been infused into the industry of all the countries, agricultural and manufacturing, through which this cheap coal has been brought. The coal owners had reduced the price of coal at the pit's mouth to the lowest that it could bear. We asked the railway companies to join us as the natural means of attaining markets by reducing their freights, and when they did agree factories grew up in Brunswick, in Hanover itself, and numerous other districts, and the consumption of coal has increased enormously, so that this doubled increase of production cannot now meet the demand.

1094. Are the collieries in Westphalia capable of producing a larger amount than they do at present?—The Westphalian district, I think, contains as much coal nearly as all England; it is very rich, there are a great number of workable beds lying under each other, but the collieries are not capable, at

present, of producing the quantity which is required.

1095. (*Sir R. Hill.*) Why so; what is the reason of that?—Their mode of production is not quite equal to ours as to quantity; they are satisfied with producing 300 or 400 tons, or much less per colliery; they do not do as they do in England, or as we do there; we produce 600 or 700 tons per colliery.

1096. (*Mr. Glyn.*) Do not they apply capital enough?—I do not think it is a question of capital so much as it is a question of exertion and the kind of demand that has been exacted for superior preparation of the coal; there is also a deficient supply of coal labour.

1097. (*Mr. Horsfall.*) Do you mean 600 or 700 tons per day or per week?—Per day. We produce from our two collieries and sell over 300,000 tons in a year.

1098. (*Chairman.*) Have the railway companies also adopted the system of lowering the rate on other articles of merchandise as well as coal?—Yes, considerably in other articles since the result in the case of the coals has been seen, and progress is still making, for they are very much pressed by the iron manufacturers to do so; they have not yet advanced in the reduction upon the raw iron itself so much as they feel convinced they must do; they are going very slowly forward, but they have reduced the rates considerably. The results, I have no doubt, will be very interesting to the Commission when I lay them before them, especially with regard to the increase of income which has been derived from these reductions to the railway companies. I will take a report, which is rather an extensive one; the yearly report of the Cologne and Minden railway. They have furnished a chronological table since the commencement of the railway in 1848, and the report to which I am about to refer terminates with 1863; at the end of each year's report they give this chronological table. Their income has very much increased since the establishment of these low fares. In 1859 their income amounted altogether to 4,600,000 thalers. It has increased up to the year 1863 to 8,300,000 thalers.

1099. Is there any greater mileage at the present time than there was in the first year?—There is. The mileage has increased from 46 to 71; that was, however, chiefly in 1862 and 1863.

1100. (*Sir R. Hill.*) Are you about to give us the gross receipts?—Yes, at this moment; but the greater portion of that income has been derived from the carriage of goods; the increase in goods has been from 2,900,000 thalers to 5,300,000; whereas the passenger traffic, which soon reaches its maximum, notwithstanding the increase which has taken place in the mileage, you will see has not very importantly increased; but it has increased from 1,300,000 thalers to 1,640,000, and those figures of 1,640,000 occur first in 1862, when the greater length of the line was opened.

1101. (*Mr. Roebuck.*) There has been no diminution in the fares for passengers, I suppose?—None; but when I come to the case of the passengers I shall show you that the passenger fares in Germany upon this line are very low.

1102. (*Captain Galton.*) The increase that you have given as in the goods, is not much more than the proportion due to the increased mileage; you said from about 3,000,000 to 5,000,000?—Yes; but from my local knowledge I am aware that the new mileage which has been opened had not been a great source of increased income in goods; it is now only commencing to develop the goods traffic upon the line; it is a line from Deutz to Gießen in the direction of Frankfurt. The main point which I wish to show is this, that the great increase, as admitted in their own report in distinct terms, has been derived from minerals, since the reduction they made in the rates. The two stations which have most contributed to that increase have been the two stations near to which our collieries are situate, and

where our works were expressly constructed for the purpose of affording to us the means of filling those express coal trains rapidly, and despatching them to the various parts of the North of Europe.

1103. (*Chairman.*) What has been the result in the shape of dividends?—Every reduction of the rates, whether in the passenger traffic or in the goods traffic, appears from this table at which I am looking to have been accompanied with an increase of dividend. I will take the extremes as regards the traffic to which we are now referring. Their rate in 1848 was 4·34 pfennigs. The next year it was 4·60. The rate for the carriage of goods is taken here per centner, and per German mile. If you will take the figures as comparative, they will convey the idea. In 1863 the rate was 2·29, therefore it was very nearly a half. Of course we cannot speak of the profits in the first year of the opening of a railway, but in that year the profit upon the capital expended 4·17 per cent. That which they divided among the shareholders was $3\frac{1}{2}$ per cent. in the year 1848. The total sum that they earned on all their capital in 1863 was 7·65 per cent., and they paid their shareholders 12 and $\frac{1}{2}$ ths per cent., and this year they will pay them 15 per cent. probably.

1104. (*Lord Donoughmore.*) Do you say that they earn 7 per cent. and pay 12 per cent.?—Yes, and that is an interesting matter to which I will call the attention of the Commissioners with regard to part of the policy of the German railway companies. The proportion of the loan and priority shares, the amortissement of which is partly paid off every year is very much larger than it is in England, their mode of financing is very different from ours. The chief increase in profits I find has taken place from the year 1859. At that time they paid $7\frac{3}{4}$ ths per cent. to their shareholders, and in 1863 they paid, as I have already stated, $12\frac{1}{2}$ ths per cent. With regard to the money earned upon the whole capital, which was expended in 1859, they made 7·94 per cent., and they made 9·80 in 1860, when the traffic in coals came to be very considerable, through the low rates, and in 1861 they made 11·27 per cent. Then suddenly during the two years when the new extended line came in, which was very large, they fell down in their earnings to 8 per cent. and 7·65 per cent. upon their whole expenditure, because before that time they were making their new line out of capital, and the charges did not come into play.

1105. (*Sir Rowland Hill.*) Are you now giving the net earnings?—Yes, the words are expressly the net earnings per cent. on the expended capital.

1106. (*Chairman.*) Do you know what the extended mileage of that railway is?—I do, it is 71 German miles. For the Cologne and Minden Railway the total capital expended has been 9,341,000*l.*

1107. (*Capt. Galton.*) What is the length of the line?—The length of the line is 218 and 113 English miles. The cost of the first 218 miles will be interesting to the Commissioners to know with reference to the subsequent matters. It was 22,680*l.* a mile, and for the 113 miles the cost was 34,608*l.* a mile, but that includes the bridge at Cologne.

1108. (*Chairman.*) Does that include the rolling stock?—Yes, and all other expenditure; which shows that after all this has been a very expensive line. I have already stated that they divided in 1862 $12\frac{1}{2}$ ths per cent. among the shareholders, but to illustrate their mode of finance I may repeat that their total capital was 9,341,175, but the proportion of that upon which they paid dividends is only 1,950,000*l.*, or say 2,000,000*l.* in round numbers. That principle also applies to many other German railways, as they take a very large portion of capital up in loans and priority shares, or, as we call them in England, preference shares, which are, however, payable off in the course of a certain number of years at a moderate rate of interest and sinking fund, so that in the end the railways are becoming more valuable every year.

1109. (*Mr. Glyn.*) Is that sinking fund formed out of the receipts of every year?—Yes.

1110. (*Chairman.*) And the capital, in the case to which you have been referring, will ultimately be reduced to something under two millions?—Yes, but the Government subscribed largely to the Cologne and Minden Railway, and guaranteed interest, in consequence of which they are entitled to receive back the railway after a certain given period of years.

1111. Are the priority shares and the money which is borrowed on the lines at very low rates?—I have the exact rates here, and I believe they are $3\frac{1}{2}$, 4, and $4\frac{1}{2}$; they very rarely go up to 5.

1112. (*Mr. Hamilton.*) Is it in preferential stock or in debentures?—I am not quite certain about that, I think they are in debentures; but they are amortissable, or may be paid off.

1113. (*Mr. Horsfall.*) What do you mean by annuity shares?—I mean that they may be paid off in the way of terminable annuities; they pay off a certain sum of money, with, say 5 per cent., 1 per cent. sinking fund and 4 per cent. interest, till all is paid off.

1114. (*Sir Rowland Hill.*) It would be like what we call terminable annuities?—Yes. But in addition to this it is complicated in this case with the fact of the Government having given a very large subvention, they being part owners of the railway, and having certain powers to become owners of the railway by purchasing shares it at par from year to year.

1115. (*Mr. Glyn.*) As I understand you, the redemption fund is made up from the annual earnings on the railway?—Yes, always, and they distinguish that in their report. I may inform the Commission that there is scarcely a fact which they may desire to know as to some of these German railways that is not to be found in their annual reports. Of course I have not got them all in my head, because they do not interest me more than for the purpose of seeing what the general policy is.

1116. What is the system pursued by the German railway companies as to passenger traffic; are the fares high or low compared with the passenger fares in England?—The fares are considerably lower than they are in Ireland, at least upon those railways to which I have particularly addressed myself. They are about one-half. The fare for a first-class passenger in Germany is $1\frac{1}{2}$ d. per mile. The fare for a second-class passenger is 1d. per mile, for a third-class passenger $\frac{3}{4}$ d. and for a fourth-class passenger $\frac{3}{8}$ ths of a penny per English mile.

1117. Has there been any reduction made in the rates, or have they always worked at those rates?—There have been some slight reductions made which are perceivable by the averages in the statistics for the whole of Germany.

1118. But there has been no such reduction in the passenger fares as in the rates charged upon coals?—No; I have now before me the annual statistical statement which was published for the year 1862 by the house of Parliament, and I may observe that in the whole of the Prussian system of railways, the income derived from passengers and what belongs to passengers is 30 per cent., from goods and cattle 63 per cent., and from other sources 7 per cent. The proportions of the receipts from passengers over the whole of the Prussian system of railways, divided into classes, is as follows:—From the first class only 19/10ths per cent., from the second-class 17 per cent., from the third-class 49 per cent., and from the fourth-class 32 per cent. These are the facts over the whole of the Prussian system relating to the year 1862.

1119. (*Mr. Gower.*) Has there been any reduction made in the rates charged for the conveyance of other goods and merchandise besides coals?—A considerable reduction has been made in what they call their reduced class of goods; they are iron ores chiefly, and earths, limestone, and matters essential for the production of iron.

W. T.
Mulvaney, Esq.
5th May 1865.

W. T.
Mulvaney, Esq.
5th May 1865.

1120. With regard to manufactured commodities, has there been any reduction made?—I am not prepared to state that at present, but I can furnish that information for the Commission. I know for thorough rates and in competition with water carriage and foreign railways, considerable reduction has been made.

1121. (*Sir R. Hill.*) You have given us the rates charged for passengers upon the German railways. Are any return tickets issued, or are there any arrangements like those in England as to return tickets?—Very few, excepting in particular districts. In the private railway companies they are getting into that practice.

1122. Do they issue season tickets?—No.

1123. Do they make reduced charges for excursion trains?—They have done so on the Rhine—on the Rhenish railway.

1124. If you take those matters into account, how would the rates charged upon the German railways compare with the rates charged upon the Irish railways?—I should think that they would tell considerably against the Irish system, because the average of all the railway traffic in Prussia for all classes of persons is only 8/10ths of a penny per mile.

1125. Can you tell us the average charge in Ireland, taking into account the return tickets and the excursion trains?—I have not got the statistics here, neither are they in my possession, but from the information that I have obtained I understand that the fare for a first-class passenger in Ireland is about 2½d. per mile, for second-class passenger 1½d. and 10 per cent. added, and for a third-class passenger 1d. If the Commissioners will allow me I will take 100 miles in both countries, reminding you at the same time that the greater part of Ireland, taking, as the guide, the standard of wages, is much poorer than at least the portion of Germany to which I have alluded. To travel 100 miles in Ireland first class would cost 18s. 4d., in Germany 12s. 6d.

1126. (*Lord Donoughmore.*) How do you obtain that figure, as the fares vary upon the different lines of railway?—I am calculating a rate of 2½d. per mile, which I believe is about the rate in Ireland.

1127. That is the rate upon the Southern and Western, but upon some of the northern lines the rates are different?—Yes, and to the west of Ireland the rates are still higher, I believe; from Dublin to Galway the rate is, first class, 22s., I think it is more than 2½d. But the second class in Germany, which is fully equal to the first class in Ireland, and almost beyond the first class in England, is only a penny, which would amount to only 8s. 4d. for the same distance. The third-class fare in Ireland is 8s. 4d. for that distance, whereas the third-class fare in Germany would be but 6s. 3d., which class might be compared with the second class in Ireland. The fourth-class in Germany, with regard to the class of persons who travel, can be compared with the third-class in Ireland, and the fare would be 3s. 1½d. for 100 miles.

1128. (*Sir R. Hill.*) Are not the fourth-class carriages in Germany open carriages?—Yes, some of them are open, but some of them are closed, they have hangings in cold weather, and the climate in winter is more severe than in Ireland.

1129. What kind of carriages are used in Ireland for that class?—They have no fourth class there, I believe, except to the west.

1130. Then take the third-class passengers?—The third-class carriages are mostly closed as far as I recollect.

1131. (*Capt. Galton.*) With regard to the rates charged for goods; you have stated that the German Union of railways fix the rates for the goods?—Yes.

1132. Do they permit the general managers of the different lines to give special rates to individuals?—No; everything there is done bureaucratically.

1133. Is everything published, so that any person can ascertain the tariff at which he can send goods,

either per train load, or per waggon load, or per ton?—Always, all that information is to be obtained.

1134. You have no doubt that it does not rest with the general managers to fix the rates?—No; but I think they have made a great mistake as to the inflexibility of their rates; for variable rates, in order to carry on railway traffic properly, are almost a necessity of the system as it appears to me.

1135. (*Lord Stanley.*) Will you be good enough to explain that a little?—They made an arbitrary rule, to come back to the question of coal, to make a certain charge per mile and two terminals, but it was very soon found that if they adhered to the terminals they would shut out from themselves and the coal owners a very large trade to Bremen, to Hamburg, and to Berlin, in which places the competition of England was considerable. Therefore, after a great deal of consideration, the German Union itself of that system of railways resolved, upon the representations made by the coal owners, to reduce the rate, and they did so accordingly. I could perhaps illustrate the facts better by referring to a very interesting map which has been made by the Prussian Government, showing the production, consumption, and circulation of the various fuels in Prussia. The dark squares upon the map represent the quantities and places and quantity of production of the coal. The map was made very much upon my suggestion to the minister to show how a reduction of the rates would lead to an extension of the trade. Before the year 1860 none of the Westphalian coal reached Magdeburg, but in consequence of the reduction that was made in the rate, it has now reached it, and much further (*explaining the map to the Commissioners.*)

1136. (*Capt. Galton.*) Does the Government fix the rate?—Upon any of the railways in which they have an interest they approve of the rates which are charged, for instance upon the Cologne and Minden railway.

1137. Where they have no interest in the railway do they interfere?—No, they cannot interfere directly.

1138. They do not interfere any more than they do in England?—They do not.

1139. (*Chairman.*) You have not given a full answer to the question put to you by Lord Stanley as to the reason why you objected to fixed rates?—I have put the map before the Commissioners in order to show that the coal owners could not have sent, and the railway companies could not have carried, coal in any large quantities to Bremen and Hamburg were it not (with regard to those ports where competition was to take place, with England, for instance,) that a reduction to those places took place for that purpose by taking off the terminal charge of 3s. per waggon load in order to enable it to be done. The railway companies themselves were convinced of the necessity for it and they abandoned it, and in the same way they did so at Berlin.

1140. Has there been any agitation in the intermediate towns with respect to a reduction in the terminal charges in consequence of their having been taken off in Berlin and in Hamburg?—Yes, and it is a constant subject of agitation. The principle of the thing seems not to be justified at all; I mean making these terminal charges where such an article as coal is loaded by the producers and is unloaded by the consumers without cost to the railway company.

1141. (*Lord Donoughmore.*) If a large quantity of coals is to be unloaded at a station, must not the company who are the owners of that station provide sidings for the purpose?—They should do so, and they have found it to be their interest to do so, and they have extended the stations very considerably. In Hanover it is a subject which is constantly brought before the Parliament to grant additional sums of money to increase the stations in consequence of the new increase of trade which has come to the railways from these very coal trains which I have already mentioned.

1142. Does it not appear just and reasonable that the company which provides the siding accommoda-

tion should receive something beyond mere mileage rate for conveying the coal?—It was upon that ground that the terminal was proposed to cover the expense of keeping books and so forth; but these sidings, we contend, are for the benefit of the railway company, because they bring to the company trade which they would not have, if they did not provide that accommodation.

1143. Take the case of two railway companies; one of them carries the coal, say for 10 German miles, the coal then passes off that line on to the line of the next company, who also carry it for 10 German miles. The coal is then discharged at a station belonging to the second company, at which station the second company must have provided siding accommodation. In that case would it not be fair that the second company should receive something more than half the total charge for the carriage of the coal, the siding having been provided at their cost?—Yes, in the abstract it appears to be so, but when you recollect that the other railway company has also its stations at which coals, I may almost say certainly stop, and they have similar things to take into account, it equalizes itself, I think, all over the system; they obtain the advantages resulting from encouraging the trade and bringing into use the first necessity for manufactures; the collateral and indirect advantages have been generally found by liberal minded thinkers upon the subject, to balance any of the little questions of debtor and creditor account at the commencement of the trade arising from these causes.

1144. I will suppose that a train of coals is carried for a certain distance over different railways, and the distance so carried over I will divide into three equal parts. Suppose that each of those three parts belongs to a separate company, that the coals are loaded at the station of one company and pass along the line on to the line of another company without being unloaded, and that they are discharged at a station belonging to a third company. Would it not be fair that the companies which have provided accommodation for loading and unloading should receive more than the intermediate company which had not, and would it not be manifestly unjust to give a full third to the company which had incurred no expense for the loading and the unloading?—Clearly in the particular case that is put, but I believe that most of the large railway companies in London provide vast accommodation for the coals, even storage room and so forth, at very moderate rates indeed, whereas the German railway companies which I have spoken of provided nothing but a siding. Following the advice that I gave to the railway directors in Hanover, founded upon the example which is furnished by the railway companies in London, they have had a harbour constructed, and they have provided means for delivering the coals off the railway into the ships, feeling that thereby they brought new traffic over their system which otherwise would not have come.

1145. (*Mr. Glyn.*) As I understand you they do not stack the coals upon the railway stations at all?—As little as possible.

1146. Do they do so sometimes?—Yes. The railway companies let to the coal owners a place for their accommodation.

1147. For which they have to pay a rent, I suppose?—Yes; the charge is not included in the terminals I have been speaking of.

1148. (*Sir Rowland Hill.*) You have compared the fares charged on the German railways with the fares charged on the Irish railways. Can you say anything as to the comparative speed of the trains in Germany and in Ireland, referring now to the passenger trains?—I cannot speak exactly to that point, but from the experience I have had in travelling I think there is very little difference between them; the quick trains in Germany are very good indeed.

1149. Are they so quick as the quick trains in Ireland?—I should think there is very little difference between them; it is something like 35 miles an

hour, I think, and by the courier trains in Germany the accommodation is unquestionably better.

1150. Is the speed in Germany equal to the speed in Ireland?—I cannot say, but I may say this, that whilst the Irish railways are so depressed, many other railways in Germany, besides the Cologne and Minden, are also paying very large dividends, and some of them along this very North German Union to which I have referred.

1151. (*Chairman.*) Is there any competition between the different systems in Germany?—Competition is by law prohibited in Prussia, but they are feeling the error of their ways, and with reference to that the government itself is at the present time very liberal minded. Statesmen in Germany, who take large views of the subject, are disposed to do away with the law which prohibits competition, and in Prussia the government itself are absolutely changing the law and promoting lines in order to produce competition.

1152. (*Lord Stanley.*) In what manner can competition be prohibited by law?—By an express enactment in the original law on the subject, whereby a line cannot be conceded by the minister which should be deemed to be a competitive line. They wish to reform the law in that respect.

1153. Then the laws have guaranteed to railway companies a monopoly of a certain district?—So far as the question of what is a competing line goes, but there have been found openings for evasion, for instance if a line does not go from end point to end point of its competition, it is tried to be evaded. The Government think that it is wrong, and they are promoting state lines, and they wish to have the law changed; they are also promoting canals for the purpose of making a reduction in the rates charged.

1154. (*Lord Donoughmore.*) They are promoting state lines in competition with lines which have been made at the expense of private companies?—Yes, they are, for instance the Bergish Markish Railway; and with the full consent of all parties in Parliament who see that there has been a palpable error committed, and that competition is the sole means of keeping down the rates. The Germans are now pretty well convinced that low rates will produce high dividends, and that they have committed an error in limiting the dividends to a certain figure and then reducing the rates for the purpose of keeping the dividend down. That is a matter which is better understood at present.

1155. (*Lord Stanley.*) If a line of railway has been made upon an understanding with the Government that the promoters of the line shall have a monopoly of a certain district, how can the Government break through that understanding without incurring the reproach of committing a breach of faith, or making in some form or other compensation to the railway company whose privilege they take away?—They seek to make compensation in some other form by conceding to them certain privileges which they had not before. The Commission are aware that legislation in Prussia is totally different from legislation in this country, and this is a subject to which I meant to advert; for instance the preliminary expenses attendant upon the passing of a railway bill, or rather obtaining a concession, there are very low indeed. I believe I am right in saying that the various expenses of one class and another accompanying the passing of railway bills in this country before a sod was dug would amount to something very nearly like the cost of the whole of the Prussian railway system.

1156. (*Mr. Hamilton.*) With what department does it rest to authorize the construction of a railway in Prussia?—It rests with the Minister of Commerce and Public Works I believe.

1157. Then the restrictive Act to which you have alluded would be an Act restricting his discretion?—Precisely, as I understand the case.

1158. (*Mr. Horsfall.*) Is not the guarantee you have spoken of as being given to certain railway com-

W. T.
Mulvaney, Esq.

5th May 1865.

W. T.
Mulvaney, Esq.

5th May 1865.

panies limited to a certain term of years?—I cannot speak with certainty upon that, but it is generally so. A concession is generally limited to 50 years with the power of increasing its duration upon the application of the whole company, and with the sanction of the State.

1159. The question is, whether these concessions are not made to certain railway companies upon the understanding that after the termination of a certain period, say 15 or 20 years, the Government shall have power to take possession of the railway?—That is only in the case where the Government has given a subvention at the commencement. I know that that exists in the case of the Cologne and Minden railway. I believe that it does not exist in the case of the Rhenish railway, nor in the case of various other private companies.

1160. Is it not also the case in France that the Government has power to take possession of a railway after a certain term?—I am not aware.

1161. (*Mr. Glyn.*) You have alluded to the large dividend which some of the companies in Germany are paying?—Yes.

1162. I suppose that in those cases the capital of the company is based upon the same principle as that to which you have alluded before—there being a very small real capital, the rest of the money having been borrowed?—I will give you the facts. I have already quoted the Cologne and Minden Railway. The Rhenish Railway, with a capital of $6\frac{1}{2}$ millions, has only three millions of original shares. It is 227 miles long, and it has cost 21,749*l.* a mile. That company paid in 1863 six per cent.

1163. Do you mean upon its own capital?—Yes; after paying off all the interest and the sinking funds and its loan charges for the year. The Bergish Markish Railway, which is under the management of the Government, and which I believe was originally a private company, has cost four millions of money, and it has 1,900,000*l.* of original share capital. It is 158 miles long, it cost 22,000*l.* per English mile, and it has paid $6\frac{1}{2}$ per cent., or it did so in 1863. The Berlin and Potsdam Railway, from the Elbe to Berlin, cost 2,200,000*l.*, it has only 750,000*l.* of share capital, it cost 22,484*l.* a mile, and it paid 14 per cent. in 1863.

1164. (*Sir Rowland Hill.*) Is not the same principle adopted by many, if not by most, of the English railways—paying up a certain amount of capital and then borrowing what may be wanted beyond that?—The proportion in Ireland is a very much smaller proportion of loans. I believe it is from a third to a half. I believe it does not exceed one third. I may mention one more—the Magdeburg and Halbertstadt Railway cost 735,000*l.* and the share capital amounted to 255,000*l.*; it cost 13,360*l.* a mile, and they have paid 22*½* per cent.

1165. (*Chairman.*) Has the Government in all cases a voice in settling the tariff on the Prussian railways?—Only on those which are under the Government control, or receiving Government loans.

1166. Are the other railway companies at perfect liberty to charge what they like, and is there no restriction?—I am not aware.

1167. (*Mr. Glyn.*) Is there no fixed tariff?—Yes. A tariff is published by every railway company.

1168. Is it fixed by the same body?—I think I had better not answer that question, for I might mislead the Commission. I will ascertain how that is; it is probably defined in the original concession.

1169. (*Mr. Gower.*) On the Government lines do they in practice interfere as to fixing the rates, or do they leave that to the discretion of the managers of the railways?—The Government departments manage everything themselves. Everything must be approved, every stage of it, every change of any kind that is made as to rates, or putting on trains; and so forth, must be approved, of course on the suggestions of the local managers.

1170. Are they supposed to fix the rates with reference to the interests of the public, or with refer-

ence to the interests of the railway companies?—The principle propounded by almost all the various States which I have visited—Hanover, Brunswick, and Bavaria—is to fix the rates more with reference to the interests of the public, keeping their interests in view, than the interests of the railway company; but then, taking Brunswick, for instance, and Hanover too, the gentlemen who are at the heads of those departments have been there from the very commencement, and are very clever men, and the chairmen of the Government Boards, and they have devoted in those two cases the most enthusiastic attention to the subject, and generally their representations are accepted by the Government of the State. In Prussia everything is submitted with the greatest formality, and it has to go through all the stages that it is possible to pass through before anything is done.

1171. In your efforts to persuade the Governments that a reduction of the rates would be beneficial, did you not put forward, as a chief inducement, that it would be profitable to the railway companies themselves?—I put forward a double inducement that it was essential, in order to raise the interests of the trade of the country, that it was the very lever by which the whole trade of the country could be raised, and that it would, instead of being an injury, absolutely be a profit to the railway companies. I wrote in those terms, and I laid particular stress upon my opinion that it was essentially the duty of the Government to set the example on the State lines.

1172. Was it not part of your case that it would be no loss to the railway companies?—Certainly. I showed that the cost was about a farthing a ton per mile, while they would receive nearly a halfpenny, and therefore that it would be a profitable concern; that if the mass of the business done was large it would justify their putting on additional rolling stock, and it has turned out to be so.

1173. Do you think that they would have sanctioned it if it had been a loss to the railway companies?—No.

1174. You do not think that they would have sanctioned it if it had not been for benefit of the companies?—I do not think that the department would have felt justified in doing so.

1175. (*Chairman.*) Are you of opinion that the Irish railways could be managed more advantageously for the country than they are?—The management seems to me to be an exceedingly difficult question. I believe that competition is essential to success in almost all great commercial matters, I believe that it is totally foreign to the office of the Government to manage railways, and I say so, because I have spent the greater part of my life in the Government service. I think it is peculiarly so in this country and with our constitution. It succeeds in some of the districts of Germany tolerably well. In Hanover nearly all the railways belong to the State, and in Brunswick it is so also; but then, as I have already stated, there are men there who are really masters of the position in each of those cases, and who have been there since the birth of the system, and who carry it out with the zeal of originators, but the difficulties which arise from delays before anything can be done are excessive. With regard to Ireland the consolidation of the management, as it has been pressed upon me by some friends of mine, and putting the whole of the system of Irish railways under one management, however tempting, I fear would only lead to a monopoly, whilst at the same time the present state of affairs there is greatly to be deprecated. The railways are not joined together, and they have remained in that unconnected state for very many years. Of the railway systems which come into Dublin none of them go down to the harbour; they approach it, but they are not connected with the harbour or the shipping. The Midland Railway within the last two years has done what was proposed to be done very nearly 18 years ago, namely, to connect itself with the harbour, and that is the only exception; the difficulty of passing from one system to another still re-

mains. The northern system is in a great number of hands, and I have no doubt that that creates many difficulties in the management. The late manager of the Midland system has explained to me that goods passing through the centre of Ireland owing to the want of meeting trains, say, from Cork to Belfast will take very nearly a week, in the ordinary course of things, from various stoppages and delays which occur, whereas we know that if a suitable connexion were made—for instance in Dublin—they might go through in ten hours.

1176. What is your view as to what ought to be done in the case of the Irish railways?—I confess that I am greatly at a loss to know. I cannot reconcile to my mind the principle of the Government managing such things, and the question is, what can be done. Unquestionably, if capitalists in this country were to take up the whole system, and to reduce the rates—for I look upon a reduction of the rates to one half as essential—it would lead immediately to a loss, and they would not recover from it for two, three, or perhaps, four years. Then we come to the development of traffic, and that has been hitherto, I may almost say, prevented. But, if the difficulty of that period of loss could be got over, I would still say that the system of management by the companies, keeping up the separate interests by competition, would be the best, if a control could be got over them, to induce them to carry out a reduction of the rates. If, however, they cannot be convinced, like the Germans, and persuaded to reduce them voluntarily, then the question will remain, for the interests of the country, whether those gentlemen can be met in anything like the way in which we, the coal owners in Germany, met the railway companies, by giving them a guarantee during the time of the experiment.

1177. Do you believe that a great deal of traffic might be developed in Ireland which has now no existence if it could be carried on at much lower rates?—I am convinced of it; but I do not take the exaggerated view that many persons do upon this subject, and who seem to think that people will travel who have no business to travel; for instance, I do not believe that to run trains from London to Ramsgate in the winter season, at low rates, would induce passengers to go as they do in the summer time, or that it would fill the trains. People would not go even from London, and *a fortiori* they would not go in the agricultural districts of Ireland. But I believe that a reduction in the rates to something like the German standard would unquestionably develop, both in passengers and in goods, but still more in goods, a very large traffic. I believe that the goods traffic in Ireland is very small indeed, in comparison with what it ought to be, and would be. Upon most well developed systems of railways, the income from the goods traffic greatly exceeds that which is obtained from the passenger traffic; but taking the great systems in Ireland, the Great Southern and Western, and the Midland (until the last two years), and the Northern, when they approached Dublin there was a break in the communication for goods, and there was cartage through the City of Dublin, and all those difficulties, which no doubt had the effect of preventing a large or increasing goods traffic. I have found it to be the same in Bremen, Hamburg, and Rotterdam, and other places, with the coal traffic, that unless we went alongside the ship, and discharged the coals out of the railway waggon into the ship, it was quite enough to cause us to lose the markets we sought to open.

1178. (*Mr. Glyn.*) You have given, as an illustration, goods sent from Cork to Belfast, and you state that there was great delay; does that delay chiefly arise from the want of local accommodation as between the different railways, or from a want of harmony and system between the respective boards?—I believe that it does not arise from a want of harmony, but, as I understand it, it arises from this:—that, upon each little branch upon which a waggon may come, it must remain until the next train arrives which

is going in the direction required, so that in that way a waggon sleeps, as I may say, many nights at various stations along the way before it reaches its destination.

1179. Does not that show a want of concert between the respective boards?—If there is not a through traffic organized to enable them to send on trains, that might account for it.

1180. Would not that be remedied by making proper through traffic arrangements?—Then there must be a sufficient traffic to justify the owners of the little branches to put on a train for that express place; for example, if it were desired to send a waggon, or two, laden with flax goods to the north of Ireland from the south, to be manufactured, say in Belfast, unless they could make up a train-load there would be a difficulty in a quick transit by cross lines, whilst, if the main trunks were joined in Dublin, these two waggons could run through with the ordinary trains.

1181. Would not the object be attained if the trains of all the companies were allowed, as a matter of course, to run over that small railway?—Clearly; running powers ought to be given.

1182. Would not that considerably tend to cure the evil?—Yes; if the traffic was there, but I am not aware that it is there. I do not believe it is developed.

1183. (*Lord Donoughmore.*) The illustration that you have given refers to goods being brought to Dublin by railway, but have they not an additional difficulty to contend with, viz., the competition by sea?—As far as my experience has gone there is nothing to be feared from that. Take the coal traffic from the north to London, the railway competes with the sea; and the traffic from the north to London by railway has slightly, as far as my experience has gone, increased on the railways, and is decreasing in the shipping. I believe that most classes of goods and particularly the low priced goods, will not bear the cost of transshipment and cartage, say to the ship in Cork, and again taking them out of the ship at Cork, and then cartage again to the store in Belfast. If a waggon, as a principle, can run from the producer to the consumer, that will put down every competition.

1184. (*Mr. Glyn.*) What is the rate per mile for the carriage of coals in Ireland?—As far as I have been informed, the rates for coal in Ireland are about a penny per ton; $\frac{3}{4}$ ths of a penny is the lowest I have heard of.

1185. (*Chairman.*) Is that nearly about the rate charged on all the lines?—I am told so.

1186. (*Mr. Glyn.*) Do the companies find the waggons, or do the owners find them?—There are no private owners of waggons in Ireland, I believe.

1187. (*Lord Stanley.*) You are of opinion that if the railway fares in Ireland were generally reduced to the extent of something like one-third of what they are now, the success of the experiment, after a certain number of years, would be certain; but that a loss during that time would be equally certain?—Yes.

1188. Who will have to make up that loss?—It is perfectly certain that there would be a loss in Ireland, and that the recovery of it would be slow; but I believe it would be perfectly certain. The doctrine propounded by some of the chairmen of the railway systems in Ireland, was, that there existed only a limited supply, and that it was useless to suppose that that supply would be increased. I believe that that is a complete begging of the question; but I heard the same arguments constantly used when we first commenced our attempts in procuring reduction in the rates in Germany. The parties are now convinced that production has gone on step by step with the facilities which have been afforded for transport.

1189. (*Lord Donoughmore.*) You stated, I think, that the district with which you are connected in Prussia is a vast coal field, and that it has enormous capabilities of production, which are not yet developed?—Yes.

1190. I wish you to compare the chances of traffic in Ireland, which as you are aware, is not a coal producing country, with the chances of increased traffic

W. T.
Mulvaney, Esq.

from the lines of railway running through Westphalia; and do you think it is reasonable to hope, supposing that the rates for the carriage of goods in Ireland were reduced, that there will be such an increase of the traffic in Ireland as in Westphalia?—No, I do not believe, without reference to the matters which I have alluded to in my evidence, that Ireland would produce it, but I may say that I look to the introduction of coal into Ireland as the lever and the means of improving that country, coupled with low rates for the transport of goods, beyond anything else; and I propose to show that it is practicable. Dublin is at present the very centre of the various railway systems in Ireland, it has been so for a long time, and when I was in office, it was an object of interest to me to draw attention to the necessity of forming connexions between the various railways in that country and the ports of Dublin and Kingstown. After many years this was not carried out, but recently an Act has been passed through Parliament for the purpose of effecting this connexion. I was consulted upon it at a very early stage, they sent out to me in Prussia the designs. I advocated the matter, and encouraged it in every way, but I suggested that special reference ought to be had to the development of the coal trade, and the importance of certain docks, called the Grand Canal Docks, whereby a branch being laid down to them, a through system of communication, which is so successful here, for example, at the Victoria docks, might, with the greatest facility, be established there. As far as my experience has gone on the Continent, and everywhere else, I have seen no manufactories, nor any great industry successful, where there has not been a regular supply of coal, even where there has been water power, wood, and turf in abundance. I believe that it would be quite practicable to deliver coals in the interior of Ireland 100 miles from Dublin, at a cost varying from 1*s.* to 16*s.* a ton, and to have it regularly supplied there, so that manufacturers and other persons requiring it should feel satisfied that they would be quite safe and secure in commencing operations there. That is only to be accomplished by bringing coal in vessels, or I will say steamers, from the English coast, right alongside the railway in the harbour; for the present moment, I will say in Dublin, which is the centre of the railway system. There it could be unloaded from an 800 ton ship, or a 600 ton ship or steamer. She could come in, if suitable arrangements were made, and discharge her coals in a space of twelve or fourteen hours into railway trucks, and the railway trucks could go off into the interior of the country, to the places of consumption. I am assuming that the coal would be put on board the vessel on the coast of England, it is done frequently at Newcastle, and places thereabouts, for 6*s.* a ton, and I take it that about 4*s.* a ton, on a large trade, would pay for the carriage of it, assuming that suitable arrangements were made to carry the trade on, and that the railway companies would deal with the matter in hundreds of thousands of tons, and that the same company would provide depôts at the various internal stations of Ireland (as the advantages of the system developed themselves), and in the places in which it might be necessary to furnish coal. The coal would then be carried at the same rate as in England and in Germany, and in waggons going from the harbour to the interior of the country. It could be carried 100 miles for 4*s.* 2*d.*, which added to 4*s.* would make 8*s.* 2*d.*, and 6*s.* would make 14*s.* 2*d.*, then adding 1*s.* for unloading, 15*s.* 2*d.* would be the cost of the coal carried to a distance of 100 miles from Dublin. I have a very strong belief that that is practicable, and a proposition has been already made for the purpose arising from my suggestion. I have conversed with an engineer in London, Mr. Mallet, who is well acquainted with the metallurgical productions of Ireland, and a proposition has been made for the purpose of utilizing the docks to which I have referred. I believe that a very important return trade is to be had from Ireland. To my knowledge there are nu-

merous ores in Ireland which lie and must lie perfectly useless unless either coal is taken to them or they are brought to the coal, the former being the most natural and certain course. The same railway truck that would take the coal into the interior of the country could bring back not only those ores, but many other raw products, such as marble and fine earths, pottery earths, and so forth, and various other articles of a very cheap class. They could bring them back with advantage at half the price that the coal was carried at, and those same train loads might be put into the coal ships and returned to England (supposing that the arrangements were completed, it would of course take some years before that would be the case), but in that way the coal ships would be able to go back in a second or third tide, and sail away from the harbour to the English coast. In this way the railways would carry the fuel into the remotest parts of Ireland at the cheapest rate, affording a means for the steady development of the industry of all classes. There is a great want of railway facilities in this respect. For instance, Ireland produces a large quantity of wool, and it all comes away, I believe, in a raw state to be manufactured; it is not manufactured there. Although water-power is cheap, yet it does not appear in the end to be adopted, and in fact the result of any observations which I have been able to make in other parts of the world has been this, that manufactures themselves do not thrive without the assistance of the coal, regularly and cheaply supplied. I believe that coal would in this way be in many parts of Ireland as cheap as in many parts of England.

1191. (*Lord Stanley.*) You are probably aware that there has been a great increase in the consumption of coal, especially in the southern parts of Ireland?—Yes; since the establishment on a similar principle to that I speak of by a gentleman at Cork, who is a large shareholder in the Dutch-Rhenish railway, and who has been introducing coal into Cork as I understand, and into the interior, is sending it by railway.

1192. (*Mr. Hamilton.*) I suppose that even if lower rates had not the effect of introducing manufactures, which you seem to be sanguine about, into Ireland, you would have no doubt that those lower rates would materially develop the resources of Ireland in every way?—Unquestionably that would be so. I have alluded to the development of manufactures, mainly by the introduction of coal; but a reduction of the rates for travelling, and for the carriage of agricultural produce, for instance, from the purely agricultural districts, like the western parts of Ireland, and some of the southern parts would be most beneficial. I may ask what can be more absurd than the idea, for instance, as I find in the case, that a penny per ton per mile is charged for the carriage of dung, as it is reported to be in Ireland. They charge such high rates there, that there can be little or no traffic, for one would scarcely think of loading such articles at such rates.

1193. On what railways in Ireland is that rate charged?—I understood it to be the general rate; I had that from Mr. Forbes.

1194. Can you compare that with the rate charged on the English railways?—No; I cannot.

1195. (*Chairman.*) You think that the traffic might be greatly increased in Ireland by charging low rates for the carriage of purely agricultural produce?—Yes; I think that the mission of railways is to diffuse the benefits which they are capable of conferring equally from the manufacturing into the agricultural districts, and to raise the character of the whole in Ireland, and it is particularly practicable to do so in Ireland, because the island after all is small, and the railways in the greater part go through agricultural districts. At their termini they are generally connected with harbours on the sea coast, and other places, from which traffic may be developed. I have heard facts stated, connected for instance with potatoes, which are produced on the coast of

W. T.
Mulvaney, Esq.
5th May 1865.

Galway, and are brought all round a dangerous coast to Dublin, in consequence of the high rates charged by the railway companies, which prevent them from being sent across the country. I may mention that in Germany lately a project has been started, which has been partly carried out, to carry corn, wheat, &c. from Hungary, and take it the whole way to the coast opposite to England, running down through the whole of the Continent, in preference to sending it to Trieste, to come round by sea, it being carried at the favoured rate which we have introduced, one pfennig per centner a German mile; the railway companies agreeing to take it in full railway trains. In the late difficulties, about a year ago, in Prussia, the Government did interfere about rates, and from the eastern or agricultural provinces of Prussia, partly by its influence, and partly from the position of those provinces, the railway companies were induced to carry potatoes, corn, and agricultural produce from those agricultural districts into the manufacturing districts of Westphalia and the Rhine at very low rates similar to the coal rates, but attaching the same condition that they did in our case, that the train should be full, and should run through.

1196. (*Capt. Galton.*) That is to say, full train loads?—Yes.

1197. (*Mr. Glyn.*) Are they acting upon that full train system upon the French coast with regard to the produce sent from Hungary?—I am not aware whether it is now in operation.

1198. (*Chairman.*) From your knowledge of Ireland, do you believe that there are numerous resources in that country undeveloped?—I am perfectly sure that there are.

1199. Are there any ores which are sufficiently rich to pay for working them at present?—Yes, quite rich enough to pay for working, if they are only brought to the coal, or the coal is taken to them. I have referred to Mr. Mallet, who is a metallurgist, and is thoroughly acquainted with the mineral wealth of Ireland, and which are the positions where it is best available to be developed by railways. I have myself seen quantities of minerals lying about in Galway, which have been brought down to the harbour, but which could not be sent away on account of the expensive carriage; and in many other districts iron ore is very abundant and of a superior quality, but there it lies.

1200. (*Lord Donoughmore.*) There is coal there too, is there not?—Yes; but unfortunately it is not as free to work as our coal is in Prussia, and it is often embarrassed with some difficulty as to the title.

1201. You are so familiar with Ireland that I need scarcely remind you of the Kilkenny and Tipperary coal districts; you are aware of them?—Yes.

1202. Is it not an extraordinary fact that, although those mines have been worked for many years, no railway company has ever thought it worth its while to run a branch into either of those districts?—Yes; but I assume that the coal could not be obtained in sufficient quantities to pay, by its transit over the line, the interest upon the money expended. I know that the coal is of the anthracite kind, and that it is difficult to get out cheaply in large quantities.

1203. The beds, I believe, are not thick?—No; I believe that, at the present time, the whole of the collieries in Ireland do not produce so much coal as one of our collieries does in Germany, which I have worked myself. But I do not assume from that, that they could not produce vastly more than they do, and the first essential is what you have referred to, a connexion with a railway. Without that connexion—without the waggon goes to the coal pit—it is impossible to send coal to any distance at a cheap rate. Coal is a very low priced article, and it must be so; therefore it will not bear the cost of transhipment except where it is taken in large quantities, and on a well organized system, as I propose to send coal to the centre of Ireland itself.

1204. If it is not worth while to make branch railways to develop the Irish coal trade, what reason-

able ground is there for hoping that a reduction of the rate for the carriage of coals would very much increase the English coal trade?—Because that English coal trade is already developed; you can have any quantities that you wish to have from England over to Dublin. Ireland imports at the present time about two millions of tons, and I understand that about 600,000 tons of the gross quantity go into Dublin, and this, without any connexion of the railways with the harbour, or with each other at Dublin, so as to facilitate the passage of this cheap article throughout the country. If, then, you can go and buy coals largely on the coast of Whitehaven and Lancashire, the coal owners will deliver their coals into the ships at the average price which I have stated. I do not mean all screened coals, but I mean the coals that come from the pits, for the Irish could consume the slack as well as the large coal, at anything like 6s., and if you deal with hundreds of thousands of tons, I believe there is no question that that coal would be taken cheaper into Kilkenny than you would get the Kilkenny coal for. I have been making arrangements to run coals to Paris from Westphalia through the middle of the Belgian coal field, and I can do it to-morrow with the same advantage to myself as to Berlin, if one link in a branch of the railways will agree to the same rate for the through trains.

1205. (*Capt. Galton.*) At what rate?—At less than a halfpenny a ton per mile.

1206. (*Chairman.*) Can you raise coal in Prussia better than they can in the Belgian coal fields?—Yes, our coal beds are from 4 to 6 and 7 and 8 feet thick, whereas the coal beds in Belgium are by no means so thick, they are not more than three feet thick. In addition to which, they have combinations amongst the coal owners, (which practice, however, no doubt will find its level,) by which they keep up the price of coal in Belgium.

1207. (*Sir Rowland Hill.*) Are the wants of Ireland, in respect to coal, now supplied in abundance at Belfast, Cork, or Dublin?—At Cork I am told that it is increasing very much. I understand that they have made arrangements for effecting a communication between the railway and the harbour.

1208. Is coal cheap in the different ports of Ireland?—In the eastern ports it generally is.

1209. Cheap and abundant?—It is very irregular. In Dublin the supply is very irregular, the coals running up to a very high price if there is stormy weather, for instance, because Dublin is supplied by small sailing colliers that come into the port and there sell their coals in bags out of the holds of the vessels, which is taken away in carts, but there is no organized coal trade there except supplies for gas works, &c.

1210. Is it used in any of the ports largely for the purposes of manufactures?—Very largely for the manufacture of gas, and for any manufactures that may exist; in Belfast, for instance, it is used extensively for manufactures.

1211. As I understood you, you expect that if communication with the interior parts of Ireland is made very cheap, coal will be very largely used for manufacturing purposes?—Yes, for private consumption and for manufactures.

1212. Of course the supply to the ports of Ireland is quite independent of the internal communications, and I should like to know whether the ports are now supplied cheaply and abundantly with coal, and whether it is in the ports or in the neighbourhood of the ports applied largely to manufacturing purposes?—It is so applied in the ports of Belfast, Dundalk, and Newry; and with regard to what manufactures there are in Dublin, what they want is a connexion between the ship and the rail, which I consider would originate a greatly increased demand, and almost a new trade.

1213. (*Capt. Galton.*) At the present time, there are no facilities for unloading coal in a cheap manner from the ships in any of those ports?—I will not

W. T.
Mulvaney, Esq.
5th May 1865.

say, in any of the ports. I have not been in Belfast for some years.

1214. (*Sir Rowland Hill.*) Can you explain why those facilities have not been afforded?—That would be to explain an anomaly which exists, not only in Ireland, but in many other countries, which advance slowly. These facilities have only as yet been recently afforded in London, and they are not yet afforded to the fullest extent. You unloaded the coal up to a few years ago into barges, and brought it up the river, but now you have got an improved system at the Victoria Docks; they have there erected hydraulic cranes, and they unload coal extensively, and put it into the railway trains, weighing the coal and discharging very large cargoes within the space of a day.

1215. All that is the result of private enterprise, is it not?—I believe it is, and nothing else does in England. There is a very great want of enterprise in Ireland; take, as an example, the question of the connexion of the railways. There is the Great Southern and Western; the Midland Company are the first who have done anything, but the Great Southern and Western and the Drogheda lines come very near to the port, but not to it, and there they have remained for many years in the same state, the lines were constructed without giving that connexion, and when the matter was suggested to some of the parties, what they said was, "How can we do anything with it, we are only making a small rate of interest on our money; instead of improving, everything in Ireland is going down, so that we had better let matters remain as they are." There is a want of enterprise; but I should suppose that there is no want of capital if a right policy were adopted.

1216. (*Capt. Galton.*) Do you know the present price of coals at the stations in Ireland in the centre of the country or at Belfast?—I do not; but I have recently heard that in Kildare Mr. More O'Ferrall gets his coal at 14s. or 15s. a ton at a place not very far from Dublin.

1217. (*Lord Donoughmore.*) But that coal is taken by canal?—Yes; and there is Mr. Monsell also, who informed me, by shipping at a suitable season he had coal at a cheaper rate in the south-west.

1218. (*Capt. Galton.*) Do you know at what price coal is delivered in Limerick?—No; but I know that years ago it varied immensely in price.

1219. (*Chairman.*) Are you of opinion that the freights on railways ought to vary according to the time of the year?—No. What I say is that you cannot make a rigid rule, and that to propose fixed rates as a rigid rule, per mile or per ton, is inconsistent with the very nature of the trade itself, because it must vary with the circumstances of the locality, and must vary even with the times and seasons. I illustrated that by referring to Ramsgate, which, in the summer season, will pay the railway company well with very low rates, but of course in the winter time no one will go there.

1220. Are you not in favour of imposing very strict restrictions on the liberty of railway companies as to fixing tolls?—I should be disposed to fix a very much lower maximum than at present exists, but to allow the greatest possible liberty to railway companies to go below that maximum.

1221. If they reduced their maximum in certain cases, you would not allow them to reduce it in all?—No. I believe that the management of railways is a profession, a science in itself, which requires the deepest study, great powers of combination, and a great knowledge of the country, and of the traffic to be carried,—and I do not believe it is wise to fix arbitrary rules, and to prevent that gradual development of knowledge that railways themselves at this time are only just unfolding. How far one may go in either a reduction or overcharge, in the rates of freight is the great question for the public. The passenger traffic, after it has reached to a certain amount, as far as I have observed in almost every country that I have visited, varies very little therefrom, whereas, on the other hand, as to the rates for the carriage of goods, of

cattle, of agricultural produce and mineral produce, no one has, I verily believe, as yet arrived at the boundary to which one may go with profit to the railways by a reduction of the rates and affording facilities for carrying traffic through a country. I take it that the mission of railways is not merely to carry the traffic that exists in a country at the time they are formed, but to seek out and make new traffic altogether in the country as I have already pointed out that we did in the particular case I mentioned. Markets were only available by railway for 10 miles when we began, and we have made them available now, with enormous advantage to the railway companies, for nearly 100 German miles.

1222. You do not think there is much probability that the present railway companies in Ireland will fulfil that mission?—I do not believe they will, they have not the courage, and, considering how they stand as to their shareholders, perhaps it is impossible to expect it. They see a certain loss before them, and they will not study nor consider the question of the future gain which they might make, and perhaps they cannot. Their argument is, we have here a certain traffic in the country,—that is what we have to carry,—and we must make the most out of that. I believe that to be a complete fallacy in railway management, and I believe it to be a begging of the question too; and it has been proved elsewhere where a reduction of the rates has been steadily carried out for a sufficient time. They also say, and you will hear railway managers say it every day, that an article must come to a certain railway. We had the same difficulty to deal with in Germany; they said, Our line is there, that article must come to it. But they made a very great mistake, because only so much of that article would go as could not help going—no increase of that article would go on it as long as the rate was nearly prohibitive or even discouraging.

1223. (*Lord Donoughmore.*) Are you aware that of late years the profits on Irish railways have gone on decreasing very much in the last year or two?—Yes, and I attribute that to the fact of their absolutely driving traffic away from them.

1224. You think that they have starved the traffic by maintaining high rates?—Clearly.

1225. You do not think that this depreciation is to be attributed to the emigration of the population, or to the sufferings of the agricultural classes in that country?—The more the population has decreased of course the fewer they will have to carry; but I think the error which has been committed by railway directors in Ireland has been in assuming too much that railways are constructed for passenger instead of for goods traffic, for the goods traffic would serve more to develop, at low rates, the resources of the country and to pay railway companies than the passenger traffic. The German labourer gets about from 1s. 4d. to 1s. 6d. a day, and the Irish labourer does not get 1s., I dare say that is the case in the western districts even now. Formerly it was not more than 6d., and in Germany you see the labourers travelling by railways. You see the German women coming in with their large baskets of vegetables or fruit a distance of 10 or 15 miles into a market town at a cost of 3-8ths of a penny per mile, and they make their marketing before 12 o'clock in the day, and go away in crowds. That is not so in Ireland, except in the neighbourhood of Belfast, where it does partly exist. The third-class passengers in Ireland are charged the same fare as the rich part of the people are charged in Germany who travel in upholstered second-class carriages, and the anomaly to any one who frequently visits both countries is so striking as to remove every shadow of doubt as to the impropriety of the rates which exist in Ireland, and the want of accommodation, especially for the poorer classes. I have here facts to show how much the third and fourth class passengers pay in Germany in comparison with the first.

1226. (*Lord Stanley.*) How do you propose to get over this difficulty, that there must inevitably be at first

considerable temporary loss, and that that temporary loss will have to be borne by the shareholders, many of whom have not, and do not intend to retain any permanent interest in the railways, who buy one day and sell the next?—I can see no remedy but an analogous one, just to compare great things with small, to that which we have done in the coal agitation in Germany, to guarantee the railway companies against the loss.

1227. But who do you propose should do that?—I do not think it is practicable in Ireland for any one but the Government or the public, but I think it would be just as to the public.

1228. It is the case of Ireland with which we are now dealing, and what can you suggest that would meet the case?—I think it would be desirable to run the risk of guaranteeing the loss, provided the Government took care to control the carrying out of the experiment.

1229. How do you propose, inasmuch as the loss for a certain number of years will be a certainty, that the Government should recover that which they would sacrifice, for I do not suppose you intend that the Government should grant a subsidy to Irish trade in the form of a guarantee upon which there must be a loss?—I am afraid it would end in their doing so, but I cannot reconcile with any system of sound policy the Government retaining the railways after they had yielded more than a given per-centage in order to recoup the public. If a private company or great capitalist could undertake the management of affairs in Ireland and carry them out firmly, I believe it would pay them right well to lease all the railways in Ireland for 10 or 15 years, and to make experiments in reducing the rates; but I dread the monopoly that would arise from that private company being in sole possession, for they would still be a company with their naturally monopolizing tendencies, and they would probably allow certain lines to get out of repair, and not keep others up.

1230. (*Capt. Galton.*) Why should they let certain lines get out of repair?—Because they could work the traffic cheaper over the others, but in that way the benefits of competition would be lost to the public.

1231. (*Lord Stanley.*) What I understand you to suggest is this, that the Government for a certain number of years, as many as might be necessary, should vote out of the taxes of the United Kingdom what would in effect be a subsidy for Irish trade?—I see no other means of compelling the railway companies to reduce their rates, for they are not open to conviction, and if they were, their shareholders would not allow them to do so for an experiment, otherwise I am totally opposed to the principle that the Government should do so, and there is but one justification of it, which is, that the whole system has been forced upon Ireland by the Government. When the first Railway Commission was brought forward, the late Sir Robert Peel, I remember at the time very well, contended on very large, general, and sound principles, that it was private enterprise, and that private enterprise should be left to have its way, and it would rectify itself; but, unfortunately, the circumstances of Ireland were totally different from those of England. The railway directions that were formed started with tariffs and rates upon the principle of the whole English system, instead of starting with rates which were suited to the country, and I believe that those high rates have tended materially to increase from the very commencement the embarrassments arising out of the state of Ireland.

1232. (*Capt. Galton.*) In what way do you mean that it was forced upon Ireland by the Government?—Because the Government did not accede to the proposition of its own Commission, which was, to have the railways laid out, and executed, in the first instance, by the Government of that day.

1233. (*Lord Donoughmore.*) You have referred to Sir Richard Griffith's Commission, have you not?—No; it was Mr. Drummond's Commission. What I

state is, that State management is wrong, or at least it is not the best—that private management is the best—and if I look at the peculiar case of Ireland, and see that the material development of that country is retarded and prevented by the want of a development of its internal resources by a cheap means of transport, which is the very lever by which the improvement of the country could be effected, one finds it difficult to suggest a remedy consistent with sound principle, when the railway companies themselves will not apply one.

1234. (*Lord Stanley.*) Suppose that the Irish railway companies were amalgamated to a certain extent, were in fewer hands and under at the most two or three separate directions, do you not think that a lower scale of fares might be introduced in this way by a gradual reduction first upon one part of an extended line and then upon another part of the line, so that the loss in each instance being spread over the whole line, would be comparatively small?—I do think that amalgamation might effect much, and I have got that down in my notes. My object in bringing before the Commission the question of the German Unions, was to show that many kinds of benefits are accomplished by the union of certain great districts, even though private companies remained in what were called unions of railways; the same idea struck me as to Ireland, that certain great districts of Ireland might be brought into unions, or the whole of them might be brought into a union. But your Lordship's question goes to the effect of consolidating various small companies in that union, and that is a different view of the question. If one could take the whole of the northern system and the whole of the western system, and the whole of the south-western system, and put them each into one company, I believe that that would be the nearest approach to accomplishing the object, and which, in so small a country as Ireland, would be the most suitable for management. It would thereby save expense in rolling stock, and would give facilities that would be of great importance, whilst it would enable the wealthy parts of a line to make up for the deficiencies that existed on the others.

1235. Suppose an arrangement of this kind, say that a company possesses 1,000 miles of railway, and suppose also, as you contend, that the reduction of the fares to one half or to one third would be ultimately profitable, although involving present loss, might you not accomplish the object gradually by lowering the fares upon 1/10th part of the line each year, so that the loss would not be so heavy at any one time as if the reduction had been made over the whole line?—I fear that a reduction on a certain part of a line would attain but little, and I believe that the experiment, whenever it is made in Ireland, should be made rather over the whole line, and if it is desirable to proceed progressively as to amount, I should advocate a reduction to a half, and not to a third at present. The same view would be carried out by making a reduction over the whole line, but not to the whole amount of half at once, although I think you will find that the most experienced railway managers would recommend a quick development of traffic, and in order to quicken the development of traffic and make a certainty of it at once, a reduction to the scale you mean to go to would be expedient, because that would at once give a certainty to every one living in the district. Many people would say, I will start my manufactures now, because I am sure of this state of things, and it will not be changed; whereas, if there was any uncertainty in the matter, a man would wait. I think that every day that this material and simple question as to Ireland is delayed, the chances of improvement in the country are delayed also; that is how it appears to me, quite independently of politics and mercantile vexed questions. I have followed the improvements going on in Ireland during the last few years, and it has always struck me that this is the great lever that is requisite in order to improve the state of that country.

W. T.
Mulvaney, Esq.
5th May 1865.

W. T.
Mulvaney, Esq.
5th May 1865.

1236. (*Capt. Galton.*) Has not the reduction in the rates on the German railways taken place chiefly in the case of new traffic; for instance, the traffic which they carry now at those low rates did not exist before, did it?—Yes, there were 200 collieries in the same district, but they could not get the material to or carried by the railways.

1237. (*Mr. Glyn.*) When you went to the German Unions you pointed out to them the certainty of increased traffic, and directly upon that they granted your application for a reduction of the rates?—I could not show them the certainty, as it was then problematical, and depended of course upon the consumption; but I showed them that if certain quantities were carried, if they began with one express train a week, for instance, that that train could go and the waggons return empty, without any back loading, for a farthing per ton per mile, and that during the time they would receive for that train a half penny per ton per mile; we had to run a risk, and we had to guarantee to the North German Union their full rate for 25,000 tons to Magdeburg.

1238. They did not agree to decrease the rate until you had entered into that guarantee?—No.

1239. (*Mr. McClean.*) Did you find your own waggons?—No; the railway companies find them, and we have reduced it very much to that principle now, that the country that wants the coal sends its waggons into the coal-producing country.

1240. If the Government guaranteed the mortgage debt in Ireland so as to enable the companies to borrow money at a low rate, would they undertake to give a low maximum rate for the carriage of minerals?—I do not know how the circumstances stand as to the mortgage debt.

1241. (*Sir Rowland Hill.*) A large portion of the debt has already been advanced by the Government, has it not?—I do not know.

1242. (*Lord Stanley.*) Assuming, as you have done before, that upon a large reduction of the rates a temporary loss and an ultimate gain are equally certain, do you think that the railway companies would be justified in covering that temporary loss by a loan returnable by means of a sinking fund at the end of a few years, the proceeds from the line being applied to keep the returns up to the average at which they had been before?—With the strong convictions that I have as to the ultimate success of the measure I do not hesitate to say that they would be justified to carry out the policy boldly and efficiently. I believe that any railway company would be justified in taking a loan on the terms of repaying it out of future profits, and the profits to arise in the meantime while passing over the period of difficulty.

1243. Making up the deficit in their income by means of a loan?—Yes.

1244. Do you think that might be done without Government help, or Government interference?—Clearly, in the way of a common commercial transaction, but the difficulty that strikes me in the matter is this, how you are to enforce the carrying out of the system, for, of course, it would require a legislative enactment to oblige them to reduce the maximum rates.

1245. And a legislative enactment to authorize them to borrow for that purpose?—Yes, on the condition of their reducing their rates.

1246. Not compelling them?—No.

1247. (*Sir Rowland Hill.*) If the Government guaranteed the railway companies against the temporary loss arising from the diminished charges, would not that have the effect of neutralizing the efforts of the directors to cultivate the traffic for a considerable time?—I am precisely of that opinion, and I have noted that down, that they would go to sleep on the question, and therefore it is that one objects to the circumstance of the Government being the medium by which this should be carried out. But I think the question of the noble Lord would meet the difficulty by leaving it optional to the parties

to borrow the money in the open market, in order that they might pass over the critical period.

1248. Should you be prepared to recommend in lieu of your own proposition a guarantee from the Government?—As I have already stated, I should feel the greatest difficulty in advocating any guarantee from the Government.

1249. (*Chairman.*) But you do not see anything else for it?—No, except the leasing or borrowing before referred to.

1250. Do you think that any effect might be produced by lowering the present rates to the extent of one-sixth, or one-fourth at a time?—I think not, after all the consideration that I have been able to give to the question that we have been dealing with. I think it would fail, and in fact it has been tried in a neighbouring union, it certainly has produced some effect, as it has brought some trade by a sort of half measure, but a half measure with such an object in view, I fear is not to be relied upon.

1251. (*Lord Donoughmore.*) I think you have said that on the German railways special or exceptional rates do not exist; that there is a general tariff settled and determined upon by the railway authorities, which tariff the officers of a company have no power to depart from?—None; that is the general principle, there are special rates for Government purposes and special rates for their own service; but for the public in general, everything is fixed and published.

1252. The officers of the company cannot depart from that tariff?—No, speaking of Germany; but in Holland the management was under an Englishman, Mr. Forbes.

1253. I believe you are aware that on both the English and Irish railways the general managers of companies have authority to make special bargains with individuals for the carriage of their goods?—Yes.

1254. And that at points where two companies enter into competition with each other, or where there are two independent routes—say from A. to B.—the managers are constantly in the habit of bidding against each other in the market for the traffic?—I take that for granted, from similar cases that have come under my own observation; but I am not aware of that in Ireland.

1255. How do you think that that practice affects the profits of the railway companies?—I think it has been attended, in one instance at least, with the greatest possible advantage; that is, having various rates to suit the circumstances. For instance, to recur to the Dutch-Rhenish Railway, that system was pursued throughout, but in Germany it does not exist, as I have already stated, that I know of, except in the case of very large arrangements which have been made by me with the companies, and in which, however, they always say, "We will give the same to any one else; we will do the same for others as for yourself;" but that was not done by the managers, and not either by the whole board, for I think we had to obtain the sanction of the minister to it. But in Holland they admit of that on the Dutch-Rhenish Railway, which was managed by Mr. Forbes, and the success of that railway originated in that freedom on the part of the manager of which I have spoken. He worked for the interests of the concern. The railway shares, when he commenced with it, were at a very low discount, and they are now paying nine per cent. The 16l. shares are at 7l. premium.

1256. Has Mr. Forbes's railway to compete with other lines?—It had to compete with a line of navigation, the Rhine, and it also had to compete between Rotterdam and Amsterdam with a line of railway that goes by the Hague.

1257. I suppose that if Mr. Forbes hears that there are 100 tons of goods at Cologne waiting to be taken to Amsterdam, he will endeavour to get the carriage of them?—He will send his messengers without delay to try to get those goods to carry.

1258. He would try to underbid the river conveyance?—Yes, he makes every exertion through his agents to get the traffic for that railway in that way. People soon began to find the advantage of using the railway, and profits quickly flowed into the treasury of the railway.

1259. (*Mr. McClean.*) Do not you think that Mr. Forbes is right in endeavouring to get the traffic at low rates?—Yes, he is perfectly right in the interests of the railway company.

1260. (*Capt. Galton.*) And in the interests of the public?—Yes, the result was shown directly, by having cheaper means of transport for the benefit of the public.

1261. (*Mr. Dalglish.*) When you established a coal traffic between your collieries and Magdeburg, I suppose you paid to the railway company a rate which was just the difference between what was the value of your coal at the colliery and the value of the coal which came from England?—You have stated very nearly the principle.

1262. What fixed the principle?—It was this. Here was an article to be sold at a certain place; how was it to be sold there; there was no previously established market for it, so the producer, the carrier, and the seller or the consumer, must agree upon terms, and it was obliged to be an equalized arrangement between them openly carried out, by which the article could be offered at a price it could sell for, and the three parties should participate equally in the profits. On the other hand, however, I may say that where that has not been done openly, very great injustice has been done, and it has prevented railway companies sometimes from carrying out their mission. In the case of a Government railway, in Bavaria, they gave a great reduction of the rates, and the coal owners took a large benefit from that reduction to themselves, whereas in those arrangements in North Germany, the price of the coal at the colliery was fixed and known to the railway companies in treating for a reduction of the rates.

1263. Do they carry all the other produce of the district to Magdeburg at the same rate per ton?—They take all other coals, but not all other produce.

1264. There would be a special rate for coal?—Yes, simply a special rate for coal.

1265. They would not carry agricultural produce at the same rate per ton?—No; but the experience which they gained in the case of the coal, has induced them to bring agricultural produce from the eastern provinces to the western at very nearly the same rates, I believe.

1266. Why should not the same principle be applied to Ireland. If the coal masters in England, in Wales, or in Scotland could see their way to establishing a large coal trade to Ireland, why should they not say to the railway companies, If you will deliver our coals at a certain rate, we will send the coals to you?—In the first place, the railway people will say, We are not buyers of coal; you must organize a system. What was done in Germany was this—we were forced to be not only the coal owners, but the coal merchants in the distant markets, and organized the system, working hand in hand with the carriers or railway companies for a common benefit in establishing a new trade.

1267. You know that at Magdeburg there was a coal trade?—There was an English coal trade.

1268. In Ireland, do you know that there is a large demand for coal at any particular point?—In parts of Ireland there is, but not in the interior, to a large amount; it has to be created by degrees.

1269. The railways do take coal into the interior, do they not?—They do; but it is chiefly for their own consumption, and some small quantities for the country; for instance, in 1863 the receipts of the Great Southern and Western for coal were 9,430*l.*, over the whole line; on the Dublin and Dundalk nothing; and on the Midland Great Western 2,000*l.*, so that there is but a small trade at present. On the Dublin and Wicklow they have only just begun, the

receipt has been only 170*l.*; but they are beginning to carry mineral traffic.

1270. (*Lord Donoughmore.*) Have you got a return of the quantity carried to Limerick?—No, I have not.

1271. (*Chairman.*) Have you stated most of the principal facts which you desire to lay before the Commission?—Yes.

1272. Is there any back carriage in the trucks which carry your coals on the North German Union lines?—Scarcely ever. I have read, in the report of a recent debate in the House of Commons, that the Chancellor of the Exchequer referred to the necessity of a back traffic, and I wish to correct it, and to say that neither in England, nor in Germany, nor in fact in any country where there is a large coal traffic, is there any back traffic, because the waggons could not wait for it, and you would require an enormous rolling stock in the shape of waggons to wait for a reloading at the far end, unless arrangements are made to reload similar articles, such as ores; wherever we have them and organize a quick reloading, it is progressing well, and will progress rapidly in Germany. In England, I believe, there is no back traffic, and the regulations have been made on the supposition that there was no back traffic, and that the waggons go back empty.

1273. With regard to the nature of the German unions of railways, they do not amalgamate, do they?—No; they only unite for the purposes of the through traffic, and they run their rolling stock; but not their locomotives, over the lines. There are scarcely any running powers in Prussia, at least for one railway company to go over another, with a very small exception, near Minden.

1274. The principle is not uniform rates and tolls?—Only for the through traffic; all the domestic or internal traffic is entirely under the control of each separate company.

1275. (*Mr. Glyn.*) For the through traffic are there uniform rates throughout?—Yes, generally, not always, I believe; and those rates are settled between the various members of the union.

1276. (*Chairman.*) As to passenger trains in Germany, are they as frequent as is usually the case on most of the railways in this country?—They are very frequent in the district with which I am best acquainted. There are courier trains, quick trains, and what are called "personnel" trains, which stop at every station; they are in both directions increasing yearly on every line, and the fullest possible amount of accommodation is given to the passengers there. A matter of the deepest interest, in comparison with Ireland, is the accommodation which is afforded to the 3rd and 4th class passengers, the persons who can pay the least, the low rates at which they are carried, and the amount that these low rates yield towards the profits of the railway companies.

1277. I understood you to say that there is a general feeling now springing up in favour of a system of competition instead of the present system in which there is none?—Both on the part of the public and on the part of the Government of Prussia. I do not allude to small Governments which have their own interests involved in their own little state lines.

1278. (*Capt. Galton.*) Has not the Government of Prussia several state lines?—Yes, and they have the exact state of the case, the cost, and everything yearly published in a report which I have here, and which I can leave with the Commissioners; it gives the statistics of the railways in Germany, showing which are the state railways and which are the private railways managed by the State, and which are the private railways managed by themselves, the profits obtained, and the cost of working, and every item of general interest connected with them.

1279. Is that for the year 1863?—No, it is for 1862; the report for 1863 is not yet published for the whole of Germany.

1280. You have stated that you had coal carried from your colliery to Paris; what is the distance?—

W. T.
Mulvaney, Esq.
5th May 1865.

W. T.

Mulcancy, Esq.

5th May 1865.

I have been misunderstood ; I said that we could have had it carried ; the distance is about the same as the distance to Berlin, to which place we do send it.

1281. What is that distance ?—I think that is 75 German miles.

1282. What is the total charge for the carriage of the coal per ton ?—I can tell you what the cost is presently—the distance to Paris is about 350 English miles.

1283. Cannot English coal be laid down at Paris cheaper than you could lay it down there ?—I do not think so. For the best coals I believe they are prepared to pay 1*l.* a ton in Paris as well as I recollect.

1284. That would give you 5*s.* for the price at the

pit's mouth ?—Much more. Our average price at the pit's mouth has been down to 5*s.* 7*d.* for all classes of coal, but that class of coal would come to 7*s.* or 8*s.* a ton, screened coal, and the railway freight would be about 12*s.* 6*d.* per ton.

1285. (*Chairman.*) Are there any documents that you would like to hand in ?—I will hand in the published statistical account (*handing in the same*).*

1286. Have you any written papers of your own that you would like to hand in ?—No.

1287. If there are any questions which have been put to you, and which you have not completely answered, you can add to them when you correct your evidence ?—I will do so.

The witness withdrew.

Wednesday, 10th May 1865.

PRESENT :

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
THE RIGHT HON. ROBERT LOWE, M.P.
J. A. ROEBUCK, ESQ., M.P.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.

GEO. CARR GLYN, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ.
J. R. M'CLEAN, ESQ., PRES. INST. C.E.
WILLIAM POLE, ESQ., F.R.S., *Secretary*.

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. WILLIAM FORBES examined.

1453. (*Chairman*.) You have been for many years, I believe, engaged in the management of railways, both in England and in Ireland?—Yes, for the last 20 years.

1454. What railways have you been connected with in Ireland?—With the Midland Great Western of Ireland, and the Great Northern and Western. I will explain to your Grace on the map.

[The witness pointed out, on the map, the lines of railway with which he had been connected.]

1455. Are you now manager of both those lines of railway which you have mentioned?—Not at the present time; I have left Ireland for about a month.

1456. Up to a month ago were you the manager of both the Midland Great Western and the Great Northern and Western lines?—Yes.

1457. Had you then opportunities of becoming well acquainted with the districts traversed by those railways?—Certainly with regard to those, and I am tolerably well acquainted with all the systems of railways in Ireland.

1458. Have you formed any opinion as to the effect of the present rates and fares which are charged upon the Irish railways, and whether they are calculated or not to develop, as far as possible, the traffic of the

country?—In my opinion they are prohibitory of any development of the traffic, and have been so ever since I have known the country.

1459. Can you adduce any facts to corroborate your opinion?—Yes. I have had occasion frequently to compare the rates charged in Ireland with those charged upon other railways, and particularly in England, and in the majority of cases the Irish rates are as high, and in some cases higher, than on the English lines of railway; and considering that Ireland is a very poor country, I do not think that that is a fair state of things, because the lines have been made cheaply, and they have to accommodate a poor population. I therefore think that the rates there should be considerably lower than the rates in England. Practically, since the opening of the railway system in Ireland, nothing has been done in the way of experiment; they started with the English rates, English passenger fares were established in Ireland, and they have done nothing to alter them; they have not tried to lower the rates; I think the result would be a very large increase in the traffic, and a great benefit to the country, if they tried a very much lower scale of rates.

1460. (*Lord Donoughmore*.) Did you recommend to your directors that an experiment of that kind

Mr. W. Forbes

10th May 1865

Mr. W. Forbes.
10th May 1865.

should be tried?—Yes; but I was always obliged to accompany it with the explanation that anything in the way of an alteration must be a very liberal one indeed, quite as much as 50 per cent., and that the effect of that would be no doubt a loss of dividend for two or three years, or even for a longer time, but that the Boards of Directors have regarded as a very unpalatable proposition, and they have never been able to accept it.

1461. (*Mr. Glyn.*) Do your remarks apply both to passengers and to goods?—Yes.

1462. (*Chairman.*) Are the fares charged for passengers upon those railways at the present time as high as those charged in England?—Yes.

1463. Is it so also upon goods?—Yes.

1464. Are the rates in any cases higher?—They are higher upon goods, and upon one article, coal, which no great effort has been made to carry on the Irish lines of railway, they are twice as much.

1465. (*Capt. Galton.*) What is the rate charged for coal?—The minimum rate is $\frac{3}{4}d.$ a ton on the Midland Great Western, but upon other lines it ranges from $1d.$ to $1\frac{1}{4}d.$, and sometimes as high as $1\frac{1}{2}d.$ per ton per mile.

1466. (*Mr. Hamilton.*) What is the rate charged in this country?— $\frac{1}{2}d.$ per ton per mile.

1467. What is the minimum and what is the maximum rate on the English lines?—I think you may take it, that the general rate all over the country for coals from the north and from Wales is $\frac{1}{2}d.$ per ton per mile.

1468. Are you not aware that many railway companies carry coals for $\frac{3}{8}$ ths of a penny per ton per mile?—No.

1469. (*Mr. Horsfall.*) Can you state what is the lowest rate that is charged on grain in Ireland?—For long distances it is about $1\frac{1}{4}d.$ per ton per mile, but $1\frac{1}{2}d.$ is the average rate.

1470. What is the difference in the charge for taking goods 20 or 30 miles and taking them a longer distance?—For the first 50 miles the general principle is to charge $1\frac{1}{2}d.$ per ton per mile, and for a further distance of 25 miles $1\frac{1}{4}d.$ per ton per mile, beyond that $1d.$ per ton per mile.

1471. Does that include the terminal charges?—No, there is $1s.$ charged at each end for terminals.

1472. (*Capt. Galton.*) Where does the coal come from?—From England entirely.

1473. To what ports does it come?—To all the ports, including Dublin. The Midland Great Western system is supplied entirely from Dublin.

1474. Does the port of Sligo furnish any coal?—A very small quantity indeed, and that is for local consumption.

1475. Is it carried by sea to Sligo?—Yes.

1476. Would a rate of $\frac{1}{2}d.$ per ton per mile, or any lower rate, say $\frac{3}{8}$ ths of a penny, enable the coal to be carried from Dublin to Sligo?—Yes. I think that the coal could be carried at a rate of $5s.$ a ton all over Ireland, that being the maximum rate, for a distance of 120 miles, at $\frac{1}{2}d.$ per ton per mile.

1477. (*Chairman.*) Is the coal traffic very limited in Ireland now?—Yes. The Midland Great Western Company's system extends over about 330 miles, and the traffic upon that in coals is only 200 tons a week.

1478. (*Mr. Hamilton.*) What are the worst gradients on that line?—On the main line the worst gradient of any extent is about 1 in 90; they are very fair gradients.

1479. (*Lord Droughmore.*) The curves are bad, are they not?—Near to Dublin they are; they follow the line of the Royal Canal.

1480. (*Capt. Galton.*) At what price is the coal delivered in those ports by ship?—In Dublin it is delivered at from $11s.$ to $12s.$ a ton.

1481. Could it be then delivered on the Midland Great Western line at $16s.$ a ton?—Yes, I believe so.

1482. What price is it now sold at at the station?—It has never had any fair trial yet, but the price ranges from $23s.$ to $30s.$, the fact being that it is not used, except by some few noblemen, who can have a

cargo brought over, or who may order 10 or 20 tons at a time.

1483. Do you think the coal would entirely supersede the peat?—Yes.

1484. Even on the Midland Great Western line?—Yes. I believe that if the price of the coal was $1l.$ a ton it would entirely supersede the use of turf procured at their own hall doors; and I consider that if coal was supplied at $1l.$ a ton it would be more economical fuel than turf.

1485. (*Lord Stanley.*) Is not a great deal of the labour supplied by the peasantry at times when their labour is of no other value to them?—No; because I know that they are very often engaged in saving turf when they ought to be doing something else.

1486. (*Mr. Hamilton.*) Are you aware what the gradients are upon the principal coal-carrying lines in this country?—Yes; on the Great Northern, that I was connected with, I had charge of a division of it.

1487. Do you suppose that there are any gradients on the Great Northern Railway as adverse as 1 in 90?—For some short distances only; the one that I gave you is, I think, the worst gradient that there is, except one coming into the station at Dublin, that is a descending gradient into the station, and that is about the worst gradient that there is; it is a very favourable line.

1488. The cost of carrying coal, I presume, would depend very much upon the gradients of the line?—Yes.

1489. (*Chairman.*) Have you ever urged upon the directors of the railway with which you have been connected the policy of trying the effect of a reduction of the rates upon coal especially?—Yes; when I joined them I found that the rate was about $1\frac{1}{4}d.$ per ton per mile; I recommended them to reduce it to $\frac{1}{2}d.$, but I induced them eventually to reduce it to $\frac{3}{4}d.$

1490. What was the effect of reducing it from $1\frac{1}{4}d.$ to $\frac{3}{4}d.$?—That the traffic increased, I think, about 25 per cent.

1491. That was attended with loss probably?—No, I think not; the reduction that was made was not sufficient to create any loss. I think that anything short of $\frac{1}{2}d.$ a ton per mile would not be of the least use.

1492. (*Mr. Ayrton.*) Upon what calculation is that opinion of yours based?—It is based upon this, that at a rate of $\frac{1}{2}d.$ a ton per mile you can deliver coals into all the principal towns in Ireland for about $16s.$ or $17s.$ a ton, and I believe that for mere domestic purposes it would entirely supersede the use of turf.

1493. What difference would $\frac{1}{4}d.$ make?—With a maximum charge of $5s.$ a ton, about $2s. 6d.$ a ton.

1494. What distance would that be for?—That would be for 120 miles.

1495. But where are the places or towns of any great magnitude 125 miles distant from the seaports in Ireland?—Take, for instance, Mullingar, Ballinasloe, and Galway. Galway is 126 miles from Dublin, right across the country.

1496. But Mullingar is not 125 miles from Dublin?—No; and therefore it could be delivered at a smaller rate. I propose $5s.$ as the maximum rate.

1497. You say that a difference of $\frac{1}{4}d.$ would make an increase of $2s. 6d.$ a ton as supplied to a distance of 125 miles from a seaport in Ireland?—Yes.

1498. What are the places that are a distance of 125 miles from a seaport in Ireland?—If you go into the interior of Roscommon you would supply the whole of that county and Mayo with coals from Dublin at the maximum rate.

1499. That would not be so, would it, if vessels came to the other side?—No; but you could not carry on the trade from the two ports. I am assuming that you have the entire trade from one port, Dublin. The freights to the other ports, that is, to Sligo and Ballina, Westport and Galway, would be much higher, because there is no return freight and no trade of

sufficient importance to induce parties to send the coal there. I assume therefore that the whole of the districts with which I am most familiar would be supplied from Dublin, and at the present charges on the coal, taking them altogether, they could afford to have them delivered at Dublin at about from 11s. to 12s. a ton. Then I say that all over the system of the Midland Great Western, and the Great Northern and Western, the maximum rate should be 5s. a ton, and that would make 16s. a ton.

1500. (*Lord Donoughmore.*) Take Galway; what is the ordinary price of sea-board coal there?—It is sold there at prices ranging from 22s. to 26s. a ton.

1501. Is it carried to Galway by ship?—Yes.

1502. What did you say was the governing price in Dublin?—From 11s. to 12s.

1503. (*Mr. Roebuck.*) What is the reason of the difference in price?—The fact is that it is in the hands of a few persons, and they can charge any price they like in Galway.

1504. (*Lord Stanley.*) There is no very great demand, is there?—No.

1505. (*Mr. Roebuck.*) As I understand it, it is not that the cost of carriage is so much greater, but it arises from a monopoly?—Yes.

1506. (*Chairman.*) With regard to Dublin itself, where you say coals can be obtained at from 11s. to 12s. a ton, is the consumption very large?—Yes; they burn nothing but coal there.

1507. Is coal consumed by all classes?—Yes; there is very little turf burnt by the poorer classes, and practically speaking coal is the entire fuel.

1508. (*Lord Donoughmore.*) Is the consumption of coal in Dublin very much larger than it is in the towns where the cost is a little higher; I mean in proportion to the population?—Yes.

1509. (*Mr. Roebuck.*) Take Cork, for instance; will the price of coal be very much higher there than in Dublin?—No; I think that there is very little difference in the freights to Cork, 1s. or 1s. 6d. Cork supplies a large portion of the southern districts with coals.

1510. You stated a short time back that the difference in the price of coal did not arise from the difference in the cost of carriage but from monopoly. I wish to know why the cost of coal in Cork is the same as it is in Dublin?—I believe there is a difference in the cost at Cork.

1511. Can you explain that?—There is more competition in the coal trade at Cork. It is a much more considerable port than Galway; they can get freights at lower rates from the coal districts, for instance, from South Wales and England.

1512. Have you any knowledge of what it costs the steamboat companies to place coals in the ports of the West Indies?—No, I have not.

1513. (*Mr. Ayrton.*) Do you know what the freights are from the coal ports in England to the different ports on the eastern coast of Ireland and on the south coast?—No; I only know the freights to Dublin.

1514. (*Mr. Horsfall.*) Can you account for the fact, that when grain is shipped from Drogheda to Manchester by a person resident at Drogheda the cost of transit is 2s. 6d. a ton less than when it is shipped by a person in Liverpool?—I do not know how that is.

1515. (*Mr. Hamilton.*) I understand your proposition to be, that there should be a uniform rate of $\frac{1}{2}$ d. a ton per mile?—Yes.

1516. Do you believe, with the gradients you have described, that that rate would be remunerative to the railway companies?—I have no doubt about it.

1517. Do you think they would get full train loads?—Yes.

1518. What loads would an engine take over such gradients?—They could take 35 waggons containing five tons a waggon, the weight of a waggon being three tons and a half.

1519. How many waggons would be drawn?—35 waggons.

1520. What weight altogether would that be in the train?—315 tons.

1521. It is your opinion than an engine could draw that load over such a gradient as you have described?—Yes, it could.

1522. (*Capt. Galton.*) You have stated that the objection of the directors to lowering the tolls was that they were afraid they should lose so much of their then income?—That referred to a general reduction of the rates.

1523. Because when you opened a new piece of line, for instance, that to Sligo, could not you carry at reduced tolls upon that line?—Not very well, because if you charge to one district where there is a line less than to another you create great public dissatisfaction, and in practice it is never done in the trade.

1524. (*Mr. Roebuck.*) Suppose that the change had been made in the rate charged upon the coal only, do you think that there would then have been a loss to the company?—I do not think that there would.

1525. If they had introduced an alteration in the rates piecemeal, you do not think that the loss would have arisen which you originally supposed would arise if the reduction were made at once?—No, I do not think it would.

1526. Did you ever try to persuade your directors to do that?—Yes, in coal rates.

1527. And they refused, did they?—Yes, they refused to make any alteration in the shape of 50 per cent. reduction in the rates; such a suggestion frightens the directors, and they do not like it.

1528. (*Chairman.*) Have you found it to be a common opinion among them that the traffic of Ireland is incapable of any material increase?—Yes, and that is the great difficulty that we have to contend with. What they say is, there is a fixed quantity of traffic, and no reduction of rates will increase it.

1529. (*Mr. Roebuck.*) And that fixed quantity they can carry?—Yes. They do not think it worth their while to make a reduction and try the experiment; they think that it would be simply to give so much money to the public. When I went to Ireland first I found that potatoes were carried from Galway in large quantities by vessels at rates which I thought would pay the railway companies very well, but upon making inquiries I found that they were charging 17s. or 18s. a ton from Galway to Dublin.

1530. (*Mr. Glyn.*) When you proposed to your directors to reduce the rate to $\frac{3}{4}$ d. a ton per mile, did you make any calculation as to what increase of trade there would be to recoup them for that?—Yes.

1531. What do you think that would have been?—My own calculation was that the effect in a year would be to increase the traffic tenfold.

1532. What would the increase be in tons?—I think that the increase would be 2,000 tons a week from 200 tons, and I believe that in that case it would supersede the use of turf at all the stations. Of course I am supposing a very much better system of management of the coal trade generally, and that the sale of coal, which is nothing in Ireland now, should be carried on as it is at English railway stations. You send to a railway station here to get a ton of coals, or say five hundredweight, as the case may be, but in Ireland a man is entirely at the mercy of the merchant, who charges a large price for it, and therefore, practically speaking, it is not used by the poorer classes at all or only by a few; but then every class living within five or six miles of a railway station in Ireland could go to a railway station, and being sure of getting a hundredweight of coals for 1s., that is at the rate of 11. a ton, would use no turf at all.

1533. Do you really think that the consumption of coal would increase in the manner you have suggested?—Yes, I believe so; with such a system of sales.

1534. But upon that line of railway only?—Yes.

1535. (*Mr. Roebuck.*) Did you suggest to the railway directors that they should become coal merchants?—Yes.

Mr. W. Forbes.

10th May 1865.

Mr. W. Forbes.

10th May 1865.

1536. Did they listen to your suggestion?—They would not entertain it all. I was anxious that they should do as is done on the Great Northern Railway, that is, that they should establish depôts and sell the coals themselves, or if they would not do that that they should enter into arrangements with the coal proprietors either in Wales or in the north of England and sell the coals, but they declined it.

1537. (Mr. Ayrton.) Is the foundation of your view this, that a peasant would buy coals at 1*l.* a ton at a railway station within a distance of six miles in preference to using turf at his own door?—Yes.

1538. Will you be good enough to state how the present rates charged upon railways prevent his arriving at that point in the greater part of Ireland. If the coal is delivered in Dublin at 12*s.* a ton, and the rate is $\frac{3}{4}$ *d.*, how is it prevented?—Because he would not get a supply; he would go to a station, but he would find no coal there.

1539. But how does the railway rate prevent that result being arrived at. You say that coal is to be sold at 12*s.* a ton, and that the railway rate is $\frac{3}{4}$ *d.* a ton; how far will it go inland?—At the present rates it does not go; there is no coal trade there at present.

1540. How far would it be carried inland before the price became 1*l.* a ton, the rate of carriage being $\frac{3}{4}$ *d.* per ton per mile?—About 50 miles.

1541. Do you find that within that distance of Dublin coal has superseded the use of turf?—No.

1542. (Mr. Roebuck.) Is not that because you have never carried the coal?—The trade does not exist, in consequence of the absence of these facilities; you cannot get persons to establish coal depôts over large districts of country unless there is some probability that the railway companies will carry it at moderate rates. The lowest rate that has been quoted is this, one firm endeavoured to establish a trade at $\frac{3}{4}$ *d.*, but they could not do it.

1543. You begun with $\frac{3}{4}$ *d.* a ton for carriage, and then to deliver at 1*l.* a ton within 50 miles from the port. Why did not that supersede the use of turf?—Those were the South Wales coal proprietors who went into the subject, and endeavoured to induce the directors both of the Great Southern and Western and the Cork line, and the Midland Great Western Company, to adopt the system that was practised in England of selling the coals at the stations, but the result of all their negotiations was that they could only induce them to adopt a rate of $\frac{3}{4}$ *d.* a ton per mile, and then only the Midland Great Western Company. They tried it for a short time, and then they found that they had to maintain an establishment in Dublin, and the expenses which they had to incur altogether for the small trade which they could do within a short radius of Dublin did not pay them, and they abandoned it.

1544. (Mr. Ayrton.) Why should not any persons in Dublin receiving the coal at 12*s.* a ton take advantage of this rate and carry on the business, why should they go to Wales to find a person to direct the business?—Because you would deal there with the coal owners, while in the other case you would deal with middle-men, adding of course to the expense.

1545. If you delivered coals only 50 miles from Dublin at $\frac{3}{4}$ *d.* a ton per mile, there would be a large margin to cover the expense; there would be a margin of 5*s.* per ton out of 20*s.*?—No, not so much as that, I think.

1546. (Chairman.) Would there be terminal charges in addition to the 12*s.*?—Yes, of 6*d.* at each end.

1547. (Mr. Roebuck.) Supposing you could only carry the coal 50 miles over a railway, would not the trade be so small that it would not be worth any man's while to take it?—Yes, and that is the reason why it broke down. The sale of the coal at places within a radius of 50 miles from Dublin did not justify them in carrying it on.

1548. And that accounts for its not being carried on?—Yes.

1549. (Capt. Galton.) You have stated that a reduction to $\frac{3}{4}$ *d.* a ton had the effect of increasing the consumption 25 per cent.; how long did it take to recoup the company?—In the first year it increased to that extent.

1550. (Chairman.) Did it go on increasing subsequently to that?—No, it is still at that.

1551. (Lord Stanley.) Your opinion is, that if the great railway companies of Ireland could make up their minds to incur a loss for two or three years, they would be certain to recover the loss at the end of that time?—Yes, I believe so.

1552. And that might take place without any interference by the Government or any assistance from the State?—Yes, that would be the result, that the companies would lose for two or three years their dividends, but I think that that is a proposition which no railway company would ever accept. It is not reasonable to expect them to make such reductions without external aid.

1553. With regard to a reduction of fares, it would seem that all that is required is, that the directors of these railway companies should understand their own permanent interests better than they do?—Yes, I think so. If I was the owner of railway property in Ireland I should not have the least hesitation in reducing the fares to the extent of 50 per cent., although it would be attended with an absolute loss for two or three years.

1554. (Mr. Roebuck.) That loss during two or three years, I understand you to say, would arise if the reduction were made at once?—Yes.

1555. But if it were made piecemeal, that loss would not arise?—In the case of the passenger fares you could not do it piecemeal.

1556. Then take the case of the coals first; there would not be the same loss then?—No.

1557. After that, in the case of the passengers, would there be a loss?—Yes, on passengers there would certainly be a loss, that is, 50 per cent. of the traffic.

1558. You are of opinion that in Ireland there would not be a sufficient increase in the number of persons travelling at the low rates to recoup the companies until two or three years had elapsed?—Not for three years at least.

1559. Would that be so in England?—No; at least I do not know whether it would be so in England.

1560. Have you any knowledge of attempts having been made by the railway companies in that direction to recoup themselves?—No, I am not aware of a case.

1561. (Chairman.) Is there any other description of traffic besides coals upon which you think a very large increase might be effected by a reduction of the charges?—Yes, it appears to me that the theory—for after all it is a theory—that the entire traffic of the country, goods, cattle, and everything else, might be increased, is correct.

1562. You look upon coals as a most important article of traffic?—Yes, that is a very important thing, but not the most important.

1563. Will you mention some other descriptions of traffic?—With regard to cattle, which is very important in Ireland, it is a matter of fact that they carry none of the store stock at all; the fat stock comes, of course, because they cannot walk them by the road for the distance, except that which is brought over to the English markets by the jobbers.

1564. Do you think that that cattle traffic might be carried by railway if the rates were made low?—Yes.

1565. (Mr. Glyn.) What are the rates at the present time?—Until about three months ago there was a uniform rate of 6*d.* a waggon a mile, but latterly they have reduced it to 6*d.* for the first 50 miles, 5*d.* for the next 25 miles, and $4\frac{1}{2}$ *d.* for any distances beyond that.

1566. Has that led to any increase in the traffic?—It has not had time yet to work.

1567. What proportion does that rate bear to the rate charged in England?—It is the maximum rate.

1568. (*Capt. Galton.*) Do you mean the maximum rate allowed by their Act?—No; as compared with the rates charged by the English railway companies it is the maximum rate charged, the highest rate.

1569. (*Mr. Horsfall.*) Can you state what proportion of the dividend on the principal railways in Ireland is derived from the passenger traffic, and what proportion is derived from goods?—The dividend is derived of course from the entire traffic.

1570. Yes; but have you calculated what proportion of the dividend is derived from goods, and what proportion from passengers?—I confess that I do not quite understand that question.

1571. (*Capt. Galton.*) What proportion of the total receipts is derived from the one and the other?—The dividend is derived from the gross traffic, and I have never ascertained what proportion is due to passengers, or what proportion is due to goods. I can give you the difference in the earnings on each class of traffic.

1572. (*Mr. Horsfall.*) Have you made any calculation as to what proportion of the dividend is derived from goods, and what proportion is derived from passengers?—I think it is in about equal proportions, half and half, on the Midland Great Western system.

1573. (*Mr. Ayrton.*) Do you mean that the net profit on the passenger traffic is half the receipts, and that the net profit on the goods is half the receipts?—Yes, as nearly as possible.

1574. Have you made any calculation as to the cost of driving store cattle for 50 miles over the roads, and the cost of carrying them by railway?—I have been in communication frequently with large farmers and landed proprietors who have attended at Ballinasloe fair, and they have always assured me that at a rate of 3*d.* a waggon a mile they would put all their store cattle on the railway instead of driving it along the roads; that would be a reduction of 50 per cent. exactly.

1575. (*Chairman.*) For how short a distance would it be worth their while to put their store cattle on to a railway?—I think for a distance of 20 miles.

1576. (*Mr. Roebuck.*) Supposing they made that experiment in addition to the experiment in the coals, which you said would be attended with no loss, do you think the companies would be liable to a loss?—Yes, certainly, it would extend over some time. I think there would be a loss upon the general traffic.

1577. (*Capt. Galton.*) You think it would take some time before they became accustomed to use the railway for the cattle?—Yes, it takes a long time in Ireland to let the public know that these facilities exist for them.

1578. (*Chairman.*) Is the general traffic in miscellaneous goods capable of considerable increase?—Yes. I think that if my former proposition, which was a reduction of 50 per cent., were carried out, it would involve an entire loss to the directors for three years, and then that it would gradually recoup the railway companies.

1579. (*Lord Stanley.*) Have you at all considered how a charge of that kind could be introduced under the circumstances of the railway companies, there being many shareholders who probably do not intend to hold their shares permanently, and who would therefore be subject to a loss of their whole profits for three years, while the ultimate gain would be not more than would make up the temporary loss?—I do not think it is at all practicable to effect such a reduction as 50 per cent. without some guarantee to the companies, for although it might be urged by a strong body of the proprietors, and the directors carried it out, at the next half-yearly meeting the directors would be all turned out, if it involved loss at first, as it certainly would.

1580. (*Lord Donoughmore.*) You do not think that the directors are to blame?—No. Without some

guarantee, they cannot be blamed for not trying experiments that might be failures.

1581. (*Mr. Ayrton.*) You propose that the earnings of a full waggon should be 3*d.* a waggon?—Yes per mile.

1582. Have you made any calculation as to what the expense of conveying loaded trains at so much per waggon would come to, taking into account the probability of bringing back empty waggons?—Yes.

1583. What is the result of that calculation?—That upon a distance of 126 miles if you can earn 1*l.* 5*s.* it will pay you well.

1584. How do you arrive at that conclusion in detail?—In this way: I take the gross earnings, and the loading of a waggon, that is, I take the average load and the receipt upon every waggon running for a distance of 126 miles, and so I have arrived at the result.

1585. What would be the average number of waggons in a train?—About 30; and I have found that upon a distance of 126 miles the average earnings of each waggon or the average receipt was about 1*l.* 2*s.* 6*d.*, therefore I think I may assume that that being the average earning of the waggon for miscellaneous merchandise, or for any class of traffic, cattle or anything, if you can, over a distance of 126 miles, earn 1*l.* 2*s.* 6*d.* you will be well paid.

1586. Will you explain how that is worked out; how do you arrive at the dividend?—That was at a time when the line earned a dividend of five per cent.

1587. (*Mr. Roebuck.*) What would be the actual cost to the railway company of running a train 126 miles?—About from 2*s.* to 2*s.* 6*d.* a mile.

1588. (*Mr. Ayrton.*) For the whole train?—Yes; that includes the original outlay and everything.

1589. (*Chairman.*) You include the original outlay?—Yes, we do.

1590. (*Mr. Ayrton.*) Taking as a basis 1*l.* 2*s.* 6*d.*, can you from that explain the mode in which, upon some estimate of the cost, you have deduced a profitable return to the Railway Company?—I took it at the time when the line was earning 1*l.* 2*s.* 6*d.*, and returning a dividend of five per cent.; what I mean is this, that on the distance of 126 miles the earning of a waggon was 1*l.* 2*s.* 6*d.*, and I think that if you can earn over a distance of 126 miles, for a waggon of goods or cattle, or any other description of goods, 1*l.* 2*s.* 6*d.*, you will be carrying at a fair profit to yourselves.

1591. You have not worked out any calculation apart from that?—No; that was my process.

1592. (*Mr. Roebuck.*) Taking it as you say, that a waggon earns that sum of money running over 126 miles, what would be the cost to the company for running a waggon that distance?—The cost would be in the same proportion, a thirtieth part, or about 2*s.* 3*d.* a mile.

1593. That would be the real cost to the company?—Yes.

1594. And all above that would be a real gain to the company, according to the sums you have mentioned?—Yes.

1595. Between 2*s.* 6*d.* and 1*l.* 2*s.* 6*d.* would be an entire gain?—No.

1596. You first of all state that by running a waggon 126 miles the gain is 1*l.* 2*s.* 6*d.*?—No; the receipt.

1597. Then call it the total earning?—Yes.

1598. What I want to know is, what the cost to the company is of running that waggon that distance?—That would form a part of the whole 30 waggons that would be conveyed at about 2*s.* 3*d.*, you cannot divide them.

1599. (*Mr. Ayrton.*) How do you arrive at this, that 126 miles is the average run over the Irish railways, especially on the Midland Great Western?—I did not say that it was the average run.

1600. You have stated that your calculations were

Mr. W. Forbes.

10th May 1865.

Mr. W. Forbes. made on the assumption that a train ran 126 miles?—Yes.

10th May 1865.

1601. If that is correct, ought not 126 miles to be the average run of a railway?—No, I do not think so; I took 126 miles at that time because it was the longest distance.

1602. How did you get at the distance of 126 miles?—It was the distance from Dublin to Galway, and it was our maximum distance then.

1603. That would be from one port to another port?—Yes.

1604. And you would come into competition with the sea carriage at the other port?—No; there is none at Galway.

1605. But that is the extreme limit to which the railway can run?—Yes.

1606. Then you have referred to a state of facts applicable only to Galway, where there is little or no traffic?—Yes.

1607. How would that be a basis by which to regulate the whole operations of railway companies when it appears to be only an extreme case, the extreme limit of a railway at a place where there is no great traffic?—I can take the mileage proportion of 1*l.* 2*s.* 6*d.*, and I will suppose that a waggon is run for 60 miles, and if you get 1*l.*s. for that you are well paid.

1608. In the same proportion for any line?—Yes, for a distance not less than 50 miles.

1609. (*Chairman.*) You say that a train per mile costs about 2*s.* 3*d.*, what is included in that, the waggons and the locomotive power?—Yes, and everything.

1610. Is anything included for permanent way?—Yes, and the general charges.

1611. (*Mr. Hamilton.*) On some of the English lines of railway the cost is materially less, is it not?—Yes.

1612. As low as 1*s.* 8*d.*, is it not?—Yes. We worked the Great Northern and Western for the first 32 miles for 1*s.* 6½*d.* per train mile, that was given to us under an award of Mr. Hawkshaw the engineer, and when a further section of the line to Castlebar was opened we went before him again, considering the sum that he had awarded was too little, and he gave us 2*s.* It is now worked for about 1*s.* 9*d.* per train mile for the entire distance.

1613. (*Lord Donoughmore.*) Does that pay the Midland company?—Not for the working only, but then it is a feeder to our main line; the majority of the traffic is to Dublin; it is between that and Dublin, and the consequence is that it forms a feeder to our line, and that is no doubt a very considerable element in the calculation.

1614. (*Mr. Ayrton.*) I presume you would not enter into a contract on the part of one company to work a line for much less than 2*s.* 3*d.*?—No, from 2*s.* 3*d.* to 2*s.* 6*d.*

1615. (*Chairman.*) You would, I suppose, be obliged to run trains with fewer than 30 waggons?—Yes.

1616. Would 1*l.* 2*s.* 6*d.* apply to small trains, trains consisting of 10 or 12 waggons?—I took that as the average.

1617. (*Lord Donoughmore.*) I believe the Midland Company has a canal running alongside of it from Dublin to Mullingar and to Longford?—Yes.

1618. That canal is the property of the railway company?—Yes.

1619. What are the rates upon the canal; are they the same as the rates on the railway?—The canal is not worked at all now, or only to a trifling extent by grain owners.

1620. Is no coal carried upon it?—Very little.

1621. No turf?—Yes, a little turf is carried, and also some grain, to the towns that it touches, but there is no public carrier upon it, and no general traffic.

1622. It is the policy of the Midland Company, is it not, to restrict the traffic on the canal as much as possible?—They have ceased to work it because there was not traffic sufficient for the two.

1623. The Great Southern and Western Company are in a different position, are they not?—Yes, they compete with the Grand Canal.

1624. They have a canal which runs alongside of their rail for a considerable distance, which they do not own, but which competes with them?—Yes.

1625. Has that competition at the points where the competition exists had the effect of lowering the rates on the Great Southern and Western line?—Yes, it had that effect, but in the last two or three years they have come to an agreement, and they work on differential rates.

1626. (*Mr. Roebuck.*) You have stated that a single carriage earns 1*l.* 2*s.* 6*d.* running 126 miles?—Yes.

1627. I want to ascertain what that single carriage costs the company running it 126 miles, and I have made this calculation, taking 126 miles at 2*s.* 6*d.*, say that that is equal to 15*l.* odd, divide that by 30, and that gives for each carriage 12*s.*?—The earning of 1*l.* 2*s.* 6*d.* is the average of every waggon that ran into Galway, that is the net receipt upon every waggon that ran into Galway.

1628. Not the net receipt?—No, the gross receipt, and that waggon may go in as one of 30 or as one of six, I could not quite precisely answer the question.

1629. (*Mr. Hamilton.*) You ought to be able to answer that question, because you have given the cost per train, which you put at 2*s.* 6*d.*, and if you take the number of carriages of which an average train consists, you ought to be able to give the actual cost of each carriage. The difference between the earning and the actual cost is, of course, the net receipt?—Yes.

1630. (*Mr. Roebuck.*) You have stated that 1*l.* 2*s.* 6*d.* is the average earning?—Yes.

1631. What is the average number of waggons in a train?—Into Galway I think it is about 20.

1632. Then supposing you divide by 20, that would make the earnings larger?—Yes.

1633. Do you adhere to that statement?—Let me take a train of 20, that would earn about 22*l.*; the cost of that would be 15*l.*, which would leave an earning upon that of 7*l.* to the company.

1634. (*Mr. Ayrton.*) Have you any accurate knowledge of the number of loaded trucks which go from Dublin to Galway daily, right through, a distance of 120 miles?—Yes, there are about 10 which go through from Dublin to Galway.

1635. By how many do you think that would be increased by a reduction of fares; how many trucks?—I think it should be doubled by a reduction of 50 per cent. upon the rates.

1636. What would the increase be mainly composed of?—I think potatoes would be carried, for I may mention that I was in the county of Galway about six weeks ago, and I found that they were selling potatoes at 3*d.* per stone within 10 miles of a railway station, whereas the price of potatoes in Dublin was at that time 7*d.* per stone; and I think that if they carried potatoes at a very moderate rate on the railways, they would carry an enormous quantity of them into Dublin, and also for the English markets. I also think that there would be a very much larger interchange of traffic between all the ports of Ireland and England if there were more moderate rates charged.

1637. Can you mention any other articles besides potatoes?—I should say general agricultural produce.

1638. What would you call it?—The west of Ireland produces grain, potatoes, bacon, poultry, and eggs; there is a large trade to be developed in these commodities.

1639. (*Capt. Galton.*) Where does the grain that is consumed on the Midland Great Western line come from?—From the districts about Sligo, and from up to Longford; that is a distance of about 56 miles. The port of Sligo supports that district.

1640. Is that grain imported into the port of Sligo?—Yes.

1641. (*Mr. Ayrton.*) I was asking you about the increase of trade between Dublin and Galway?—I

think there would be an increase in trade in manufactured goods from England. I think that if a poor man has a pig to send to the English market, or instead of what he is doing now, growing his own potatoes and eating them, you put that man in the position of being able to send his produce to the English market, he would be in a much better position than he is now. He would be able to spend more money, and that I think would cause a very large increase of traffic.

1642. What would the advantage be of his not eating his potatoes, if he required them for food; why should he send them away?—If he could get a larger price for his potatoes by sending them away, I think it is simply common sense that it would be better for him to do so.

1643. Would not the potatoes still be the cheapest article of food he could get, whether he could send them away or not?—Yes, I dare say they would.

1644. There would be no motive for sending them away?—Yes, I think there would; for instance, and this brings me to another branch of the subject, which is a system of through rates between England and Ireland, there is no doubt about it, that if a man had any of that small produce to send to market he would send it; he would send to England, to Liverpool, or to Manchester, or to places where good prices are to be obtained; he could easily ascertain what it would cost him; but at the present time that is the great drawback, that a man cannot send anything—by the existing means of transit from Ireland into England and the manufacturing districts the rates are prohibitory.

1645. (*Mr. Glyn.*) Do not through rates exist now between the manufacturing districts of England and the ports of Ireland?—Within the last year and a half they have been in existence on the Midland Great Western line, but to a very small extent.

1646. (*Chairman.*) On what articles are there through rates?—Generally almost upon everything but cattle. They have through rates from the principal stations upon the Midland Great Western, and the Great Southern and Western and other Irish systems, in connexion with the London and North-western and other lines of railway; but the great difficulty has been this, that the Irish Railway Companies will not agree to a mileage division of the rates; they say that they are acting upon this principle, that there is only a fixed quantity of traffic to be carried, and that no increased facilities which can be given will develop that traffic further, and therefore they decline to reduce their proportion of any through rate. Take this case as an example; suppose the rate for eggs to Manchester from Ireland to be 40s. a ton; the Midland Great Western rate is 20s. a ton; a through rate of 30s. would secure the traffic and very much increase it, and the London and North-western Company would agree to a mileage division of the rate, but the Midland Great Western Company say no, we will have our rate, and there is no object in making these through rates; we will not participate in the reduction of any through rate; you may make it if you choose, but it must be at your cost.

1647. (*Mr. Glyn.*) Does not that apply generally to other cases?—No; on the Northern system there is more competition.

1648. But through rates are more general, are they not?—Yes.

1649. (*Mr. Ayrton.*) Can you give the Commission any particulars with regard to any applications that have been made for through rates, and which applications have been rejected?—These applications are made daily for through rates from everybody.

1650. I mean through rates upon the Irish lines of railway, the applications for which have been refused?—The directors will not agree to any system of through rates unless they get their full local proportion of the rate, which of course is much more than they would be entitled to under a division according to the mileage.

1651. Can you give any particular cases in which applications have been made by any of the companies in England to any of the companies in Ireland asking for through rates?—The London and North-western, the Manchester, Sheffield, and Lincolnshire, the Lancashire and Yorkshire, and the Great Northern Companies have been for the last seven years pressing upon the Irish Companies, the Midland Great Western, and the Great Southern and Western, to come into such an arrangement, and they have only just succeeded, after great negotiations with them, in inducing the Irish Companies to adopt a system of through rates, but they have still done it in a very imperfect manner, for the Irish Companies insist upon having their local rates, and that of course has tended to retard the negotiations; but things are very much better now than they have been, and I think that they will improve, for they begin, I believe, to see the desirability of these through rates, the public begin to find the advantage of them, and I think the subject of through rates is very much considered now. Neither the railway companies in England nor in Ireland are responsible for the want of through cattle rates, for there is an anomalous state of the law as to the liability of railway companies as compared with steam packet companies in the transit of goods and cattle; there are no through rates as yet, (except from Dublin in connexion with the Midland Great Western,) from the Midland Great Western or the Great Southern and Western system, for cattle, and that is mainly attributable to the fact that the steam packet companies who carry the cattle and goods between the Irish ports and Liverpool are protected by their bill of lading; whereas if a railway company makes a rate it engages itself in the contract to carry the goods or the cattle to their destination; but if they are lost by the act of God or by the Queen's enemies, or if they founder at sea, the railway company is liable for it.

1652. (*Mr. Glyn.*) That is, they must run the risk at sea?—Yes, they take upon themselves the sea risk, although the steam packet companies are relieved from it. The railway companies have been in negotiation with the steam packet companies to ask them to join them in the risk, but they say no, we will not enter into it; you must try and get a short Act to release you from the same risks from which we are relieved. A deputation waited upon Mr. Milner Gibson upon that subject only last week representing the steam packet and Irish railway interests.

1653. (*Mr. Ayrton.*) What law imposes upon a railway company the risk of the sea voyage to the same extent as upon the land?—I cannot say, but it is the rule; by law they are common carriers, and if they carry goods from any port in Ireland to any port in England they are not relieved from the risks that the steam packet companies are; there is no doubt about it, for the best legal opinions have been taken upon the point.

1654. (*Mr. Hamilton.*) The steam packet companies are relieved from the risk already?—Yes.

1655. (*Mr. Lowe.*) Are they entirely relieved; are they not liable to the extent of the value of the vessel?—No; she may founder or be struck by lightning, and they can make their own conditions on their own bill of lading.

1656. If they do not make any conditions are they not liable to the amount of the value of the vessel under the Statute of George II.?—I think not.

1657. (*Capt. Galton.*) Have the sums which railway companies have had to pay under this system been very heavy?—No; the through booking system has only been in operation for a year and a half, and it does not exist at all in the case of cattle.

1658. But they might insure against the risk, might they not?—No, they cannot get a general policy; they must take a floating policy; they cannot get the other.

1659. (*Chairman.*) Does the Great Western Railway pass almost entirely through a limestone district?—A great part of it does.

Mr. W. Forbes.

10th May 1865

Mr. W. Forbes.

10th May 1865.

1660. Is there any traffic in lime?—No.

1661. Do you think that from the nature of the country it would be impracticable under all circumstances?—I think so.

1662. Is there any mineral traffic except coals?—None whatever.

1663. Is there any possibility of any such traffic being developed?—Yes; in the county of Cavan there are some minerals; there are iron ores which it is said could be worked if they could get coal to them at a moderate rate.

1664. (*Mr. McClean.*) What quantity of coal is carried at the present time on the Irish railways?—On some of the northern railways they carry a considerable quantity.

1665. What do you estimate the increase would be at $\frac{3}{4}$ ths of a penny or a halfpenny rate for the whole of Ireland?—At $\frac{3}{4}$ d. a ton. I have not studied the subject as to the whole of Ireland. In the north they do import a considerable quantity of coal.

1666. (*Chairman.*) What class of passenger traffic do you think is capable of the greatest increase by adopting low fares?—I think the third-class passengers are.

1667. (*Mr. Glyn.*) The fare now is 1d. a mile, is it not?—Yes. Although Ireland is a poor country there is no such system in practice, except on the northern lines, as there is upon a great many other lines of railway; in Scotland, for instance, there are third-class return tickets; on the Great Southern and Western and the Midland Great Western they have none. They issue second-class return tickets, but no third class; the consequence is, that the poorer class of people, for a distance of 10 or 12 miles, scarcely go by railway at all except on the market days. About two years ago they tried the system of carrying them at a single third-class fare for the double journey, and the result has been that the trains which then ran empty are now crowded on every market day; that is on the Midland Great Western line; and I believe that if that system was carried out every day in the week it would be greatly to the advantage of the country and for the benefit of the people.

1668. (*Mr. Roebuck.*) On the English railways third-class return tickets are issued, are they not?—Yes, on some of them, in Lancashire they have them.

1669. (*Chairman.*) Do you think that there would be much travelling by that class of people except on market days?—Considerably more than there is at present.

1670. Have they ever tried excursion trains on the Midland Great Western line?—To a very trifling extent, nothing like to the extent to which they ought to be tried. Ten years ago such a thing as an excursion train was unknown, and it was with very great difficulty that the railway directors were induced to try the experiment; but it was tried in the first instance at a single fare for the double journey, giving the people a fortnight, extending over the whole system of railways. The first train, I think, carried 300 or 400 passengers, and it gradually increased to about 1,600. They have now perhaps three or four trains running each way carrying from 1,500 to 2,000 passengers each train, but they have not tried the experiment sufficiently; they have only run these excursion trains twice or three times in a year.

1671. Do those excursion trains run in connexion with trains bringing passengers from England?—No, they are entirely local.

1672. (*Mr. Glyn.*) Do not the Irish railway companies issue excursion tickets in connexion with English railways?—Yes.

1673. At low fares?—They accept a single fare.

1674. I believe there is no passenger duty paid in Ireland?—No.

1675. Can you state what the per-centage of the passenger duty is upon the receipts in London; is it not five per cent.?—Yes.

1676. That is an advantage which the Irish railways possess over the English railways?—Yes. The Government duty for 1863 for England and Wales was 365,000l.

1677. (*Mr. Ayrton.*) Is the second-class accommodation in the Irish carriages generally much better than in the English carriages?—It used to be so, but latterly they have put cushions into the second-class carriages in England.

1678. The second-class carriages are more generally used in Ireland than in England, are they not?—Yes.

1679. Practically, the great majority of those who travel first-class in England travel second-class in Ireland?—Yes.

1680. Therefore, practically, they are carried at a much cheaper rate in Ireland?—No, it is $1\frac{1}{2}$ d. and something better than that per mile. I think that the average fares in England are not more than 2d. a mile first-class.

1681. (*Capt. Galton.*) The third-class fare in Ireland is 1d. a mile, is it not?—Yes.

1682. Is that the universal rate?—Yes.

1683. Do they issue to third-class passengers return tickets?—On some of the Northern lines they do, but not on the Great Southern and Western, or the Midland Railways.

1684. Are there in Ireland any regular express trains established?—No.

1685. Are you aware that the charge by Mr. Bianconi's cars was 1d. a mile?—No; but I know that Mr. Bianconi was obliged to try an experiment when he started his cars upon a new road, which I think might be tried by the railway companies; there is a great deal to be said by the railway companies about the evils of competition, but I think that Ireland has suffered very much from the want of competition.

1686. You spoke of an experiment that was tried by Mr. Bianconi, and which you said might be tried by the railway companies?—Yes, it was this; whenever Mr. Bianconi started a new conveyance in a district, and he found that it was not paying, he immediately set up a competition against himself, and started another conveyance at lower rates, the effect of which was to enable him to get passengers to travel by the high-priced car as well as by the low-priced car, and by so getting people to travel by the two, to make it pay.

1687. Is the average speed upon the Irish railways the same as upon the English?—No, it is less. The average speed of a passenger train is 25 miles an hour in Ireland, while in England it is from 30 to 35 miles an hour.

1688. (*Mr. Hamilton.*) Does that speed of 25 miles an hour include all the stoppages?—No; take Galway for instance, a distance of 126 miles, they take five hours to do that, say 20 miles an hour, or 25 miles an hour including stoppages.

1689. (*Chairman.*) Are the tolls reduced for passengers at harvest time?—Not at harvest time; but they carry a large number of harvest men from Ireland to England at the rate of $\frac{1}{2}$ d. a mile. They are carried about two months before the harvest begins at that rate, and they are carried back for about two months after it finishes; and although the population has considerably decreased in the West of Ireland, yet that traffic has steadily increased. I believe that those men could be carried all the year round at a low rate, and that they would go for all purposes of labour over to England.

1690. There would be a sufficient inducement for the railway companies to carry those men at other times as well as at harvest time?—Yes; they seek employment also on railway works.

1691. (*Mr. Ayrton.*) Do you think that tickets could be issued to certain classes of people rather than charging them the general rate by a train?—No; but I think it affords an additional reason for the reduction of 50 per cent. which I have mentioned, that those men carried at $\frac{1}{2}$ d. a mile are steadily in-

creasing each year. I think that if they made a universal charge for third-class passengers of $\frac{1}{4}$ d. a mile, the result would be that the travelling would be considerably increased.

1692. (*Chairman.*) Have any experiments been made as to the effect of season tickets?—Yes, but with no result at all.

1693. Have they ever been applied for?—No. For a distance of 26 miles out of Dublin we had it in operation for 10 years, but the number was always the same, and there was no residential traffic on the line.

1694. (*Capt. Galton.*) I suppose that on the Dublin and Wicklow lines there is such a traffic?—Yes, they have a large traffic from season tickets there.

1695. (*Chairman.*) Do you think that the railway companies run a sufficient number of trains for the accommodation of the passengers?—No, I do not think they do in some districts; for example, take the trains from Athlone to Castlebar, going a distance of 72 miles, there was only one passenger train a day each way, so that in point of fact it is utterly impossible for the people to use a railway, they cannot do it; a man cannot go from one town to another sometimes in one day; for instance, from Athlone to Castlebar, a distance of 72 miles, they cannot go there and back in a day, and the consequence is that it prevents them going at all.

1696. Did you ever recommend to your directors to put on additional trains?—Yes, I told the directors of the Great Northern and Western line this accommodation was insufficient to develop the traffic.

1697. Was that refused on the same ground which you have already mentioned?—Yes; and there is no doubt about it, that one train, carrying out the notion, if it is a correct one, that there is only a fixed quantity to be carried, is the best way to carry it; but as yet they have not tried the experiment of giving greater facilities at lower rates; I think it is a mistake myself.

1698. (*Mr. Glyn.*) You would reduce the rates, and give more perfect accommodation?—Yes.

1699. (*Mr. Horsfall.*) What is the population of Athlone and of Castlebar?—I cannot at the moment state, but it is small and inconsiderable; I think Athlone contains possibly about 7,000, and Castlebar 5,000 or 6,000.

1700. (*Chairman.*) Are there any intermediate places of any importance?—Yes, there is Roscommon, the county town, and Castlereagh.

1701. Did you carry any milk into Dublin?—Never.

1702. Might a traffic in that be created with advantage?—I never had any applications for that, and I never heard of any attempt being made to try it.

1703. With regard to parcels traffic, is there any parcel traffic of any importance?—No, I do not think there is of any very great importance; I think it is quite worthy of attention, and that every facility should be given, but I do not think that that branch of traffic is of any importance with reference to the general principle of lower rates.

1704. (*Mr. Horsfall.*) Did you state that there was only one general train from Castlebar to Athlone?—Only one passenger train per day.

1705. How many trains do you think the respective populations of the two towns would warrant?—I think that if the railway is to support itself they ought to have at least three trains, one in the morning, one in the middle of the day, and one in the evening.

1706. Do you think they would pay the expense of the rolling stock?—I believe that eventually they would, coupled with a reduction of the rates.

1707. (*Chairman.*) You think that if it was worth while to have a railway there at all, three trains a day should be run each way?—Yes; but all these reforms are exceedingly difficult to carry out in Ireland, from the fact of the enormous number of interests that there are, and some of them adverse

interests, in the railway world. The railway system of Ireland consists only of about 1,700 miles, and it earns an income of 1,520,000*l.* a year.

1708. (*Capt. Galton.*) What are the adverse interests to which you have just referred?—What I mean is this, that to control that very small affair, they have no fewer than 18 boards. I would contrast it with the London and North-western Company, which is worked by a single board of directors, one set of officers, and one establishment. That railway earns an income of 5,300,000*l.* a year; it works 1,200 miles of railway, as against 1,700 miles in Ireland and an income of 1,520,000*l.* a year. The revenue in Ireland is only about one-fourth of the revenue of the London and North-western Company.

1709. Do you think it would be advantageous to amalgamate the Irish railways with any of the English railways?—I think it would be an advantage to the Irish railways if they were taken in hand by the English railway companies, but the difficulty is to get any united action among the railway companies, which is, I think, illustrated by this, that to earn a revenue which is only equal to about one-fourth of the revenue earned by one railway company in England, there are 18 different companies in Ireland, 18 distinct sets of officers, and 18 different sets of opinions to work with, and the consequence has been that any attempt to develop the traffic in Ireland up to this time has been a failure.

1710. Do you think they would work better if they were all amalgamated in one company?—Yes.

1711. (*Chairman.*) Do you think there is no remedy for the state of things you have described but amalgamation?—Yes.

1712. (*Mr. Glyn.*) Would you propose to place the whole of the Irish system of railways under one board?—Yes; I think that it would be managed better than by 18 different boards.

1713. (*Chairman.*) You think that traffic in England has been generally better developed in very large enterprises than on some of the smaller lines of railways?—Yes, that has been the effect on the London and North-western line, and upon all those which it has absorbed, in my experience.

1714. (*Mr. Hamilton.*) Can you state what has been the total amount of capital which has been expended on railways in Ireland?—No, I cannot. The difficulty of working railways in Ireland may be illustrated in this way: I will take the coast line from Dublin to Belfast; that is in the hands of three companies; the distance is only 113 miles, and yet there are three distinct companies concerned in it, and of course there is very great difficulty in carrying out all the arrangements, because there are different opinions and different interests to be consulted. The parties see things through different lights, and the public have suffered very much inconvenience from that state of things; but there is another line which has been specially granted.

1715. (*Mr. Glyn.*) They work with through rates, do they not?—Yes.

1716. And the carriages run through?—Yes; but as between Galway and Belfast I dare say it will be in the recollection of the Commission that a great attempt was made to make Galway a very important port, but the attempt failed, and at the same time there was a great effort made by the Belfast merchants to establish a trade in the west of Ireland, but there is very great difficulty in getting any sort of union of action amongst the different parties in Ireland. As an example, I may state that a waggon starting from Galway would take, possibly, two or three days to get to Belfast; a journey of that kind ought to occupy only about six or seven hours, or ten hours.

1717. (*Lord Donoughmore.*) Surely the route from Galway to Belfast is in the hands of the Midland Company, at least to Cavan?—Yes, but unfortunately there is another interest which comes in from Cavan to Clones, which is the Irish North-western Company, who are at bitter enmity with the other section of the line belonging to the Ulster Company, who have the

Mr. W. Forbes.

Mr. W. Forbes.
10th May 1865.

line from Clones to Belfast, and the consequence is, that when the Ulster Company proposed to create a traffic to the west of Ireland, the other company interpose every difficulty they can, and they thereby sacrifice the through traffic between the west of Ireland and the north of Ireland to their own local squabbles.

1718. (*Mr. Glyn.*) Do they compete in rates?—Yes, they do.

1719. What railways are in connexion with the Great Southern and Western Railway from the south?—The Waterford and Limerick Railway.

1720. With what companies do they work or have through rates?—They work with all the companies.

1721. So that in point of fact there is but one system?—Yes.

1722. (*Chairman.*) The Waterford and Limerick Company are not on good terms, are they, with the Great Southern and Western Company?—No, they do work through.

1723. (*Mr. Glyn.*) Do they book through?—Yes, but the Great Southern and Western Company makes its arrangements entirely with reference to its own convenience, and the Waterford and Limerick Company, entirely with reference to its traffic from Waterford to Limerick.

1724. You think that all that would be cured by amalgamation?—Certainly.

1725. (*Mr. Hamilton.*) You think it would be very desirable to amalgamate all these Irish railway companies, so getting rid of the 18 boards of direction and placing them all under one superintendence?—Yes.

1726. Can you suggest any mode by which that amalgamation could be brought about?—I think there would be no difficulty about the railway companies amalgamating if they could be brought into a frame of mind to do it; otherwise I could not suggest any means.

1727. (*Mr. Horsfall.*) Have you considered the railway system in Ireland with a view to any action on the part of the Government, and with the object of improving the system?—I have formed what might be considered perhaps a very crude idea upon the subject, and it is this, that if any law could be passed to compel the railway companies to reduce their rates, a guarantee should be given in some shape to the railway companies, take for example their best year's income, and induce them to reduce the rates 50 per cent. and let the deficiency, if any, for a period of years, say three, four, or seven years, be recouped to the company, or guaranteed in these proportions, a third by the Government as having an interest in Ireland, and for the benefit of the country, another third by the railway companies, and a third to be raised by local taxation on the baronies.

1728. (*Lord Donoughmore.*) How would that proposition to raise a third by local taxation do you think be received by the people of Ireland?—They would object to it very strongly, no doubt, but it would be only asking those gentlemen who complain of these high rates to back their opinions to that extent, and to submit to a very slight tax for a time.

1729. (*Capt. Galton.*) Suppose that at the end of three years the railway company's receipts increased considerably, and they realized a higher dividend, should they not then be called upon to pay the whole of the amount?—Yes. If in the following three years, by increase of traffic, they got back to their dividend, I think they should pay back the tax.

1730. (*Lord Stanley.*) Do you think it is any part of the business of the Government to assist railway companies in carrying traffic below the cost price?—I confess that as to railway enterprise generally I do not think it is any part of the business of the Government to interfere with it; but I think that the case of Ireland is quite different, and that perhaps something ought to be done for it.

1731. (*Mr. Ayrton.*) What is the difference in Ireland?—The country is very much poorer than England, and I do not think they can afford to make the experiment without assistance.

1732. The question put to you was, whether it was any part of the business of the Government to assist railway companies in carrying traffic at less than the cost price, quite apart from the question of experiment?—I do not think it is.

1733. (*Mr. Glyn.*) Do you think that the railway proprietors would like to run the risk, as you have suggested, for a period of three years?—I am sure they would not, although a great number of the railway proprietors complain that the railway directors have not sufficient enterprise, and that they will not charge low rates, and give increased facilities to the public; but I would like to ask those gentlemen whose property would be benefited if these changes were made, whether it would not be worth their while to back their opinions by paying a slight tax to make up the deficiency that might arise.

1734. (*Mr. Ayrton.*) The line from Athlone to Galway is guaranteed by the county rates, is it not?—Yes.

1735. What is the opinion entertained by the people of that district? Do they ask the directors to reduce the rates, and if so would the directors decline to make the experiment?—Yes, they have done so, and the directors have refused.

1736. Although the inhabitants of the county are willing to meet any loss that might arise?—Yes; and I can put a stronger case than that: Lord Clancarty, who is a considerable landed proprietor at Ballensloe, made a proposition to the directors of the Midland Great Western of this kind, that he would personally guarantee them; if they would try a low scale of fares for a year, he undertook to pay any deficiency if any arose, any difference that there might be between the results of the low fares and the ordinary fares between Athlone and Galway, but they declined to accept the offer.

1737. (*Mr. Glyn.*) Did they assign any reason for doing so?—The reason which they gave was, that they thought it would be a dangerous experiment to try upon one section of the line.

1738. (*Mr. Ayrton.*) Have the inhabitants of Galway made any formal application to the company or to the grand jury of the county?—At almost every meeting of the grand jury there are expressions of indignation used against the Midland Great Western company.

1739. (*Lord Donoughmore.*) Have not those expressions of indignation generally had reference to the manner in which the persons present thought they were treated by the board of directors as to the guarantee?—They had; but I know also that before that quarrel arose they were always complaining that the rates were too high, and that they were not fairly treated.

1740. (*Lord Stanley.*) Do you think it would be possible to meet the difficulty in this way, without applying to any source external to the railway companies themselves;—to allow them to borrow money, being liable to repay it within a period, say, of 30 years, and letting them apply the proceeds of the loan so obtained to meeting the temporary deficiency caused by the reduction of the fares?—I think that that would be one mode of doing it.

1741. That might be done by obtaining the sanction of Parliament to such an arrangement without any assistance from the Government itself, or from any one else?—Yes; that is my opinion.

1742. (*Chairman.*) If such an Act was passed, would any of the railway companies in your opinion avail themselves of the powers so given?—I should be very unwilling to answer for the railway companies, for I do not know what view they would take of it; of course in such a case you would say that they should reduce their rates.

1743. (*Capt. Galton.*) Why should the railway companies borrow money to meet any loss arising upon a reduction of the rates, would not the loss simply have the effect of preventing them for a time paying dividends?—I believe that they would show a loss.

1744. A reduction in the rates would merely produce a want of dividend?—Yes.

1745. Could not they pay the dividends out of capital, or rather raise additional capital to pay the dividends?—I understood his Lordship to suggest that they should have the use of this money for a certain time, to pay up, say, in the course of three years, any deficiency, and then that the money borrowed should be repaid afterwards; that would be to meet the temporary difficulty.

1746. (*Mr. Glyn.*) Would it not be necessary to persuade the proprietors that there would ultimately be no loss?—Yes.

1747. (*Capt. Galton.*) You mean that it would be very difficult to persuade the directors to adopt any course like that?—Yes, for some of them entertain very strong opinions upon the subject, and that in point of fact is the difficulty which you have to deal with. They have a fixed notion that there is a fixed quantity of traffic to be carried, and that no reduction of fares which they might make would eventually relieve them from loss.

1748. Even although new traffic should be developed?—Yes.

1749. (*Mr. Ayerton.*) Is not the manufacturing industry of Ireland chiefly near the sea ports?—It is principally in the north of Ireland.

1750. It is near to the sea ports?—Yes.

1751. Then I presume that there would be little railway traffic with regard to that industry, and that any foreign trade would not utilize the railways to any extent?—No.

1752. Passing from the manufacturing industry of Ireland we come to the agricultural industry in the interior of the country?—Yes.

1753. There being a great preponderance of agricultural industry, is not the fruit of that industry to a large extent consumed on the ground where it is produced?—Yes, no doubt it is now.

1754. And must it not be so, so long as there is a large agricultural population in the centre of Ireland?—Yes, but there is no reason why, by the establishment of facilities, you should not create a manufacturing population; take Galway, for instance, there is water-power enough there to turn all the mills in Manchester, and that is now running to waste.

1755. If Galway was the seat of manufacturing industry, would not that industry develop itself into the port of Galway, and not require any railway facilities for its development?—Certainly not; of course it would increase the trade of the port considerably, but then you would in that way increase the wealth of the place to an enormous extent, and of course to that extent you would increase the receipts of the railway companies.

1756. Even although Galway were converted into an active port there would still be no great communication between Galway and Dublin?—I think there would be much greater communication, practically there is very little now.

1757. Would not one port have its own traffic and the other port have its own traffic with the interior?—Yes; take passenger traffic for instance, Dublin will always be the port to which Galway will find its way.

1758. I am speaking of goods traffic. If Galway became as active a port as Dublin, would the result be that there would be a largely increased traffic between Dublin and Galway?—The effect of making it a manufacturing place would of course very considerably increase the traffic.

1759. (*Mr. Roebuck.*) Take, for example, Liverpool, do you find that the traffic is diminished between Liverpool and London?—No; and I think that in a similar way, any increase of manufactures in a place like Galway would have the effect of extending the traffic.

1760. (*Mr. Glyn.*) What amount of dividend does the Midland Great Western Company pay?—In the last half year it was 2 per cent.

1761. What is the highest dividend it has ever paid?—Five per cent.

1762. Then there has been a diminution in the amount of dividend?—Yes.

1763. When did that take place?—Last year, but it arose principally from a large increase which took place in the working expenditure, and from renewals of the permanent way.

1764. (*Capt. Galton.*) Have any new lines been opened?—No, not of their own.

1765. (*Chairman.*) Had the permanent way been neglected?—I think that they had practised economy to too great an extent.

1766. (*Mr. Glyn.*) They had not renewed the permanent way from year to year?—No.

1767. (*Mr. Roebuck.*) Had there been any diminution in the amount of the traffic?—Not anything very considerable.

1768. (*Mr. Horsfall.*) Does the line from Athlone to Castlebar constitute part of the Midland Great Western line?—No, but they work it; they contributed a third of the capital, and they work it, but it belongs to an independent company.

1769. Do you think that your plan of running more trains between Athlone and Castlebar would increase the dividend?—Yes, I think so, and subject always to this qualification, that it would take time to do it, possibly two or three years, for, as I said before, these things always take time.

1770. (*Mr. Ayerton.*) Must not any increase of agricultural traffic arise from an increase of production?—Yes, of course, to a very great extent.

1771. How do you propose that agricultural products from the centre of Ireland are to get to Dublin in the course of three years?—I do not propose to confine it entirely to agricultural traffic, but, for instance, in the article of fish, nothing is done in Ireland, which arises as much from the want of these facilities being afforded as from anything else.

1772. Is not the true condition of Ireland with regard to the great mass of the country, to which there could be anything like a long line of railway carried, agricultural?—Yes.

1773. Any increase of traffic must result from an increase of agricultural products?—Yes.

1774. How are they to increase so as to double the traffic in the course of three years?—I think by the introduction of coal into Ireland you might create a large manufacturing interest, and that has been proved only in the last week by the establishment of a large spinning manufactory in Drogheda by Mr. Whitworth.

1775. Spinning and the manufacture of textile fabrics have long been carried on in Drogheda?—But those branches of industry had decayed very considerably; it was so at one time.

1776. Do you think that the introduction of coal is the only thing requisite to develop manufactures in Ireland?—No; I do not think it is.

1777. Is not the absence of such industry in the main attributable to other causes?—I do not mean to say that the other causes do not bear a larger proportion in the reason, and I do not say that coal alone is the only thing that is wanted.

1778. Is there not a great deal of water power in the centre of Ireland?—Yes.

1779. Is not that sufficient for many branches of manufacturing industry, if there were not other causes which prevented its application?—You cannot always compete in trade without the advantage of steam.

1780. (*Mr. Roebuck.*) I understood you to say that the difficulties in the way of transit and transport would prevent an increase of manufacturing industry in Ireland?—Yes.

1781. If you increase the means of transit, and decrease the rates charged, you will at least create the possibility of establishing manufactures in the centre of Ireland?—I think that they are the main essentials to the establishment of such an industry.

1782. The article of coal has nothing to do with it. What is wanted is the means of transit?—There is a

Mr. W. Forbes.

10th May 1865.

Mr. W. Forbes. combination of things, the coal, and the carriage of passengers and goods, and railway facilities of every sort are required.

10th May 1865.

1783. If you increase the traffic to a port, do not you thereby enlarge the market for agricultural produce; and do not you create an incentive to bring agricultural produce?—Yes.

1784. I suppose that that would be the advantage of your proposal, which would be derived by Ireland from an increase in the trade of a port like Galway?—Yes; the effect of course would be very considerably to increase the prices of everything produced, and therefore it would benefit very much the agricultural producer.

1785. (*Lord Donoughmore.*) Have any efforts been made to develop the fish traffic from Galway into Dublin and to the English markets?—There have been through rates established, and I think that they are absolutely necessary.

1786. If a moderate rate was established, do you think it would lead to an increase of the traffic?—I think it would; but not to the extent that that traffic ought to be developed.

1787. Why so?—Because of the great difficulty that is always found in dealing with the fisheries in Ireland. In Galway there is a class of men called "Claddaghmen," and they have always resisted every attempt to improve the fisheries on the west coast of Ireland. Two companies, I know, have been established, and they have found that they could not obtain labour, they have been interfered with, and they have been poached upon; and within the last 10 years, any attempts which have been made to improve the fisheries on that coast have entirely failed through the opposition offered by these Claddaghmen.

1788. (*Mr. Roebuck.*) I believe there is a large quantity of salmon caught in Galway?—Yes.

1789. How is that salmon transported to England?—The Galway fish almost entirely comes by railway; but from Ballina, where there is a much more important fishery, it is carried, although within 20 miles of a railway station, by smacks to Liverpool.

1790. (*Lord Donoughmore.*) Is that attributable to the high rates charged upon the railway?—Yes, to some extent.

1791. (*Mr. Ayrton.*) With regard to the development of the fish traffic from Galway, was there not a company established for that purpose?—Yes, several companies were established with that object in view.

1792. And they all failed?—Yes.

1793. Did they not fail in consequence of the opposition of the people in Galway?—Yes, the Claddaghmen; and every attempt that has been made of that sort has failed, in consequence of the opposition offered by those men; they have obstructed every attempt to improve the fishery; they have successfully resisted up to this time every attempt that has been made to improve the fisheries; and their own condition.

1794. (*Chairman.*) Are poultry and vegetables brought into Dublin by railway?—Yes.

1795. From what distance are they so brought in?—Poultry is brought from the extreme limits of the lines of railway, from Cork, Galway, and Sligo.

1796. Is it the fact that a great deal, taking a radius of 20 or 25 miles round Dublin, is brought in by carts?—No, not a great deal, I think.

1797. Do you think that most of it is at present brought in by railways?—Yes.

1798. Is it your decided opinion that there is no prospect whatever of the railway companies trying the effect of reduced fares?—Speaking from my own experience, I know that they are very reluctant to do anything in the way of reducing the fares, unless you accompany the proposition with an assurance that the immediate effect will be to increase the traffic. I have always found, when I have proposed a large reduction of the rates, with a view to the development of the traffic, that I have been met with this difficulty: They say, "It will not be of the slightest use. There is only a certain quantity of traffic to

"be carried, and we had better create the highest rate for that traffic that we can."

1799. I think you have stated that the directors were justified in so viewing the matter upon the whole?—Yes; because there would be no doubt a certain loss for two or three years, which might not be recouped, although I think it would.

1800. Do you see no prospect of any change, unless there is some interference by Parliament in some shape or other?—I think not.

1801. But you have not formed any very definite idea as to what that interference should be?—Only the very crude idea which I have already expressed, that one-third should be guaranteed by the Government, one-third to be obtained by local taxation, and another third to be borne by the railway companies themselves.

1802. That is, that two-thirds of the loss should be guaranteed from other sources?—Yes; and that the companies should bear one-third themselves.

1803. (*Mr. Roebuck.*) You have excluded, have you not, the circumstance that the directors would lose in lowering the rates upon coals?—What I said upon that was, that I thought they would be repaid for any reduction they might make upon coals in about a year.

1804. But the directors seem to have the same aversion to any change in the case of coals, as in any other case?—Yes.

1805. It is not so much that they would lose their dividend, but they do not like the change?—No.

1806. (*Mr. Hamilton.*) Do you think that the railway companies have rolling stock sufficient to carry any much larger quantity of coal?—If not, they could easily increase it; at the present time they could carry a much larger quantity, I should say treble the quantity of coal, with the same rolling stock.

1807. There would be no necessity, in your opinion, for any large increase?—No. With regard to the passenger traffic, for a distance of about 50 miles below Dublin, I think I should be safe in saying that the number of passengers, taking the year round, does not exceed, in each compartment, two persons, and if they filled all those compartments they would multiply the number by nearly 20 times and that would not make any material increase in the expenditure.

1808. (*Mr. Roebuck.*) You stated that, in your opinion, the directors were not obnoxious to any blame for not reducing the rates in the case of coals?—That is their own opinion; but I thought that by reducing the rates to a halfpenny a ton per mile they would recover any loss they might sustain in the course of a year, but they were of opinion the reduction of rate would not increase the consumption of coal; you will hear a great deal of difference of opinion upon the coal question. Lord Lucan, who is the chairman of that line of railway, from Athlone to Castlebar, entertains very strong notions upon this subject. He says that it is a perfect fallacy to suppose that the Irish people will ever burn coal in the place of turf. I have formed a very different opinion, and a great number of resident noblemen and landed gentry, are also of opinion that coal supplied at about 1*l.* a ton would supersede the use of turf at their own hall doors, and elsewhere; but certainly Lord Lucan and others entertain very strong opinions to the contrary. They say that you will never induce the people of Ireland to use coal instead of turf, and that being so it is rather difficult to convince the directors of railway companies that a radical reduction in the rates charged is a desirable thing to make.

1809. (*Mr. Glyn.*) Do you think that a system of through rates in connexion with English railways would develop the traffic in Ireland, whatever there may be there?—Yes.

1810. (*Mr. Hamilton.*) But through rates would be equivalent to a reduction of the local rates, would they not?—Of course.

1811. (*Mr. Glyn.*) I understood you to say that that was your belief, if the rates on Irish railways were to be reduced to the level of those of England?—Yes.

1812. (*Mr. Dalglish.*) Who are the persons who principally complain of the mismanagement of the Irish railways; the shareholders?—I think that the complaints are almost universal, for if you take up any Irish newspaper, you will find that it is quite a popular subject, the complaining of the mismanagement of Irish railways in Ireland.

1813. What are the principal complaints that are made?—They complain of the high rates, that is the principal thing; they say that they ought to have very much lower rates.

1814. As low as they are in England?—Lower rates than those in England.

1815. (*Mr. Ayrton.*) Do you know what the cost of cartage is in Ireland?—Upon grain it is 4d. a mile.

1816. On common loads?—Yes.

1817. That is the ordinary cartage rate?—Yes.

1818. Is not that the proper standard from which to start before persons in Ireland complain of suffering a grievance at the hands of the Irish railway companies?—Do you mean to say that they ought to take 4d. a ton a mile as their basis, and that goods ought to be carried according to that on railways?

1819. If the charge by load is so much higher than that by railway, they could have no great grievance against the railway company, which charges them so much lower?—But I think that there is no sort of analogy between the cost of carriage on common roads and on railways.

1820. (*Mr. Glyn.*) Are the terminal charges in Ireland lower than they are in England?—Yes.

1821. Considerably lower?—Yes; they do not cart in Ireland at all; it is done by agents, forwarding agents as they are called; and the consequence of that is that the public suffer very much, and it operates as a great drawback to the interchange of traffic between the two countries. In Ireland there is a set of men, who call themselves forwarding agents, they are established generally in Dublin, having agents in the English ports, and if any goods are consigned to England, a crate of eggs, for instance, these men get hold of them, and the railway companies not being their own carriers in Dublin, these forwarding agents make any charges that they think proper upon the goods, and when they arrive at Manchester, for instance, the additional charges made by them amount to 75 per cent. of the railway charges.

1822. That is a matter extraneous to the railway system?—Yes.

1823. (*Capt. Galton.*) But it is the result, is it not, of not having through rates?—Yes.

1824. (*Mr. Glyn.*) It arises partly, does it not, from a want of communications at Dublin between the respective railways?—No, it arises from the railway companies not doing their own cartage in Dublin, because there is no doubt that any railway company can do its own work better than any agent can.

1825. (*Lord Donoughmore.*) You allude to Mr. Fishbourne?—Yes, and other men of that class; and their object has been not so much to develop traffic as to make as much as they can out of it.

1826. (*Chairman.*) Are there any other points upon which you wish to express your opinions to the Commission?—No.

1827. (*Mr. Ayrton.*) Is there perfectly free competition among the persons you have just spoken of, or is any preference given to one person over another?—The railway companies have no control over the forwarding agent; he does just what he likes with the traffic after he gets hold of it, unless it is delivered to him at a through rate. Mr. Fishbourne is the so-called agent of the Great Southern and Western Company; but they cannot control his movements when he once gets hold of the goods.

1828. So far as the railway companies are concerned, are persons perfectly free, if they choose to establish themselves in that business?—Yes, there is perfect freedom.

1829. (*Mr. Gower.*) You stated, I think, that you were in favour of the amalgamation of Irish railways.

Would you enforce that upon them?—That is rather a difficult question to answer, but I think I would, rather than that it should not be done at all; if it could be enforced I think it should be done.

1830. Is there any amalgamation of railways in Ireland?—The Great Southern and Western Company have absorbed some of the smaller lines in the south of Ireland.

1831. (*Lord Donoughmore.*) The Dublin, Dundalk and Enniskillen line is also amalgamated, is it not?—Yes; that is amalgamated with the northern system as far as Londonderry.

1832. (*Mr. Glyn.*) Have the railways between Belfast and Dublin the power to amalgamate now?—No. I think that those powers have altogether expired. An attempt was made by some of the proprietors this year in the case of the Dublin and Belfast Junction and the Dublin and Dundalk, but it was rejected by the proprietors themselves.

1833. (*Mr. Gower.*) How do you account for there not being the same tendency to amalgamate railways in Ireland as in England?—I cannot account for it, except only in this way, that when the railway directors, say three or four boards of directors, come to discuss the question of amalgamation, they will have to consider a certain loss of patronage; there are certain fees attached to the different posts, and they do not like to lose them.

1834. (*Chairman.*) Do not these considerations arise in England as well as in Ireland?—Yes, they do no doubt, but they do not seem to have the same effect in England as in Ireland.

1835. (*Lord Donoughmore.*) The directors do not like to be dethroned, in point of fact?—No, I think that is it.

1836. (*Capt. Galton.*) In England they would have more opportunity to seek for another field?—Yes.

1837. (*Mr. Ayrton.*) Have you estimated what the annual saving would be by an amalgamation of all the Irish lines of railway?—No, I have not. Mr. Dargan has expressed some very strong opinions upon that point, but I do not agree with him as to the enormous sum which he says would be saved by amalgamation.

1838. (*Mr. Glyn.*) Have you calculated the working expenses at the present time of the different railway companies?—Yes, and I think that the average working expenses of the Irish railways at the present time is 49 per cent., and I believe that by a better system of management, by amalgamation or by a better union of interests, those working expenses could be fairly reduced to the extent of from 5 to 7 per cent.

1839. (*Lord Stanley.*) Is it not the general rough calculation that the working expenses absorb half of the gross receipts upon a railway?—Yes.

1840. That is in England?—Yes. If you are going to work or lease a line you take 50 per cent. as the fair working expenses.

1841. (*Mr. Hamilton.*) Generally speaking, it is less than that, is it not?—No, I think not; that is about it.

1842. (*Lord Donoughmore.*) Is not that what is generally allowed in common purse agreements?—Yes; on the London and North-western line I think it is 42 or 43 per cent.

1843. (*Mr. Hamilton.*) Do you speak from information which you have obtained of 50 per cent. being the usual allowance made for working expenses?—Yes.

1844. Are they not as low as 46 and 47 per cent.?—Yes, certainly it is so in some cases.

1845. (*Chairman.*) Do you think that there is a greater tendency to amalgamation on the part of railway companies in England, with a view to protecting themselves from competition, than there is in Ireland?—Yes. I believe that the absence of competition is most injurious not only to Ireland itself but to the railway interests in that country.

The witness withdrew.

W. T.
Mulvaney, Esq.

10th May 1865.

WILLIAM THOMAS MULVANEY, ESQ., further examined.

1846. (*Chairman.*) You wish, I believe, to supply some deficiencies in the evidence which you gave on the last occasion before the Commission?—Yes.

1847. Will you have the goodness to state the points to which you now wish to call the attention of the Commission?—I wish particularly to show the impossibility of developing any system that may be contemplated in Ireland without a connexion with the various systems of railways that exist there in Dublin, and to which I referred on the last occasion, under the head of accessories for development of traffic; without that, no system like that of the German unions, getting the traffic from one part of the country to another, can be effected.

I also desire to call the attention of the Commissioners to the necessity of being able to make sidings and branches to places that would afford trade to a railway without the enormous cost which separate Acts of Parliament for that purpose require in England and Ireland.

Another subject which has occurred to me is the question of the supply of waggons. It has been argued in Germany that the waggons should be supplied by private parties, but the principle seems to be right and just that the railway company, who are the carriers, should provide waggons for the purpose. On that question, as an accessory to the development of traffic, I would call attention to the necessity of giving certainty to the consumer and to the producer, as to the transfer of his goods through the instrumentality of arrangements made for through rates, and without the trouble and expense of personal attention at the various places where, so to speak, the bulk is broken. In reference to the second point, the German union system and its applicability to Ireland, I omitted to state to the Commission that, in those unions so called, the waggon work is provided by the various companies of the union, who furnish for the purpose of through traffic their quota of waggons for that purpose to the common work; they arrange among themselves a tariff for the transport of goods, and they fix the rate at which each party shall be paid for its waggons in passing over the lines of another party. The arrangements on all these subjects have attracted a great deal of attention on the part of the unions in Germany; and they are all contained in a little book,* which I have fortunately found, in which the various unions in Germany are mentioned, and in which all their rules and regulations and tariffs are set forth. The rates in the German unions, as I explained before, are published, and the rates for all through traffic are known to every one; but there are special rates which are charged from time to time consequent on the development of new trades. I have had in Germany considerable difficulty in inducing those unions to adopt, as a principle, a per-centage deduction from those rates for full trains running through from fixed station to fixed station; and it seems to me that, inasmuch as it saves very great original cost to the company in the transport of goods, it might be a very great advantage if it were adopted in Ireland. It has been suggested to me that there would be a difficulty in adopting the principle of the German unions in Ireland, in consequence of their not being able to compel any intervening company or end company to join in the rates. For an island like Ireland, one would naturally propose that the whole country should be placed in one union with regard to the through traffic, but perhaps it would also admit of subdivision into sub-unions under one union for particular systems. But to meet the difficulty arising from any one company refusing to adopt what the majority of the unions was prepared to approve, it may be suggested that the decision upon such a point should be provided for by Act of Parliament, the matter to be referred either to arbitration or to the

Board of Trade, or to some other properly constituted authority to decide it.

The third point to which I wish to call attention is more economical arrangements for working; and I was not before aware that that was one of the objects of this Commission. Apart from the question of low tariffs, and the principle that a mass of trade will of itself greatly economise the cost of transport, I may state that the organization of regular goods trains at fixed hours and fixed times running from one part of the country to the other has been found in Germany to have a very useful effect in stimulating the senders and receivers of goods to arrange for their being loaded in time, and furnished to those trains; and also in stimulating the traffic managers themselves to provide for the quantities to be taken by such trains, so that the locomotive which runs may have full work according to its power. The establishment of these trains has very often led to new traffic, and it is perhaps scarcely necessary for me to call the attention of the Commissioners to the fact, that nearly all railways have derived their chief profits out of the new traffic which has been created by them. In Ireland, upon the whole, I am afraid it must be admitted that very little new industry is to be expected to arise out of the present system, and it appears to me difficult to do it so long as the different lines of railway are not absolutely connected, so that the trains and carriages could run from one to the other, especially as long as the tariffs are so high as they are at the present time. With regard to the questions of direct and indirect freights, and varying and fixed rates of freight, I may observe that a fallacious principle seems to have governed them to some extent of late years in Ireland. The doctrine entertained by railway directors, that there was a fixed traffic, and that that could not be increased, has led to its natural consequences, at least in one instance, that as the traffic of passengers, owing to emigration or otherwise, diminished, the fares have been increased; and, as I have already ventured to express myself, the fares are now too high, and the natural result of that increase in the fares is proved by the dividends diminishing, and that system has naturally had the effect of starving the traffic instead of increasing it. With reference to low variable tariffs, I might perhaps call attention to this, that new markets might, in Ireland, be developed thereby. For instance, I will take agricultural produce; hay, in England and in many parts of Ireland, when I was well acquainted with that country, never exceeded from 30s. to 2l. a ton, which was the value of it in the place of its production; in most parts of England, especially in the mining districts, where they require large quantities of hay, the rates run from 8l. to 10l. In Durham it is frequently so, and in Northumberland. I am not so well aware how it stands in Lancashire, but I believe the prices there are very high; but notwithstanding this great difference in price, and I know that they can make first-class hay in Ireland, I take it that there is very little traffic in hay between the two countries. In Holland, a year or two ago, the demand for hay was so great from England, that the export of it commenced there by the introduction of one pressing machine to press the hay and prepare it for market, and I am quite satisfied that a very large and important return trade, even for the coal waggons, would be found in the various agricultural districts to be carried to a port for export, not simply in hay, but in many other agricultural products, such as roots, beans, peas, and vegetables, which go at the present time extensively to Scotland. But to enable these very cheap articles to be brought with advantage in large quantities, it is necessary, as I stated before, that the railway should come alongside the ship, and discharge these products without cost into the vessel. As an interesting result of the indirect profits arising from low fares, I may refer to the experience I gained in local agitation for reduced freights upon coal in

* Tarif-Taschenbuch, für den Güterverkehr auf Deutschlands Eisenbahnen, Von A. Rörig. Berlin.

Germany. The first consequence of it was an immediate demand for an increased quantity of rolling stock. So great was the necessity for providing waggons and locomotives, that a whole series of trades were set in motion, and these things of themselves brought to the railways increased the transport of iron and wood, and of all the articles necessary for the manufacture of those waggons; and when I merely allude to that fact, the benefits resulting will naturally suggest themselves to the minds of the Commission. On the subject of varied rates and fixed rates, which occupy the attention of the Commission, I may say that fixed rates, however low, may nevertheless bear a certain new traffic, that appears to be essential in order to have elasticity in the question of freights as in all commercial matters. In Germany the internal traffic is taken for short distances at high rates, but they are adopting a system of a falling scale of rates for traffic in proportion as the distances increase, while for through traffic they have almost invariably much lower rates than their local traffic rates. In this way, cattle, for instance, whether dead or alive, from Ireland might be usefully brought from one station to another with a view of being taken to the great market for agricultural produce from Ireland to England; and to enable the cattle to be brought with advantage to the English market, it is probable that not only a reduced rate, but greater accommodation in regard to waggons and vessels than at present can be afforded would be necessary at lower rates. This is another evidence of the necessity for power to vary the rates. I may mention, with regard to passenger traffic, a fact which has come to my knowledge. A person in the north of Ireland, I believe his name was Roe, and he told me the fact himself, leased a railway from Londonderry to the sea. He leased it from the company for a certain number of years. There were very high rates charged upon it, and I think that the special rate for passengers that he mentioned to me was 4s. 6d. He adopted then a very low rate, 1s. or 1s. 6d., at his own risk as lessee, but he immediately produced by this reduction a very vast increase in the traffic, bringing important benefits to himself. But when his lease dropped the railway direction put on the high rate again, and the traffic immediately fell off. In the same way with the harvest men who come in large numbers from the western districts of Ireland into England, the rates are charged according to the period of the year by the railway company, and with advantage for the men at the time, but after the time when the rate put on for the harvest men has passed away, they walk instead of going by the railway waggon. With regard to the question of passengers, the suggestion that I would respectfully make with regard to Ireland is that the German rates should be adopted as a maximum, 1½d. for first-class passengers, 1d. for second-class passengers, ¾d. for third-class passengers, and ⅜ths of a penny for fourth-class passengers. They are very nearly about one-half of the present rates; and I may perhaps be permitted to observe that without the construction of much more railway stock the change could be effected, if adopted, by adapting the present first-class carriages generally as second class carriages for the second-class passengers in Ireland, which would be precisely the state of facts in Germany; for the second-class passenger carriage in Germany is fully equal to the first-class passenger carriage in almost any part of England or Ireland, and so through the various classes.

With reference to the subject of coal, and the coal trade generally, I wish to show, simply looking at the circumstances of Ireland, what was effected in Germany by a reduction of the rates. It was conceived that because Westphalia was very rich in coal, a parallelism did not exist between the circumstances there and the circumstances in Ireland, and my object was to show that the distance from the Westphalian coal field to the districts, very often purely agricultural districts, to be supplied with coal, was not in

Germany much greater than it would be from the English coal districts on the coast to the interior of Ireland. It was very nearly double in the case of Germany. I would also beg to state, in reply to a question which has been already put as to the various coal districts which exist in Ireland, and which are certainly not developed for want of railways being taken to the mouths of the pits, but I believe the introduction of English coal into the interior of Ireland would lead directly to the development of those districts. I believe that the south-western part of Ireland has not yet in any way been fully explored by making borings or otherwise to ascertain its capabilities in the production of coal. Those which are in Kilkenny, Tipperary, and Tyrone, and the north are better known.

The only other matter of interest which it strikes me to mention to the Committee, is with reference to the question of how the change, which appears to be so necessary, may be brought about without destroying the principle of private enterprise and handing the railways over to the Government to manage. With reference to that I beg to recall the attention of the Commission to what is done in Germany. The Government, as I have already stated, guaranteed the interest to the private companies, and not only so, but a system was organized in the open money market by the issue of obligations in the shape of amortisable obligations, which are payable off from time to time by lot, and very large sums of money are obtained in this way at very moderate rates of interest. In the case of the Cologne and Minden Railway, which I have at present in my mind, the government from time to time guaranteed interest upon 46,000,000 of thalers, which would be very nearly 7,000,000*l.*, and about 22,000,000 of thalers besides this were taken up in the shape of obligations by private parties in the open market, and these are regularly paid off out of each year's income from the railway; for instance, in the year 1863 the net profit on the Cologne and Minden Railway was 700,000*l.* That was devoted to the payment of interest and the redemption of those obligations; 295,864*l.* is the loan proportion; the state duty is 55,000*l.*; the reserve fund is 82,000*l.*; but through the instrumentality of this system of financing, the company were in a position to pay their own shareholders, as they stated on the last occasion, 12 and ⅓ths per cent. upon their subscribed capital, the total sum which they paid the shareholders being 252,000*l.* Now it appears to me that it would be possible, with reference to the debt in Ireland on the various railway companies, that either this debt might be reduced by a similar arrangement into a terminable annuity payable off by degrees, at a low rate of interest, either directly through the instrumentality of the state, or through an enactment similar to that which is so very extensively used on the Continent, not merely in Germany, but in Belgium and France. If the Irish railway system were by such means relieved of a portion of its debt, they ought,—if the directors can be convinced by the experience which has been obtained in other countries, of a certain increase of traffic arising from a reduction of the freights,—they ought either to be in a position to effect these reductions themselves, or at least it is to be assumed, that the facts being known to the public, parties would be found who would guarantee to the shareholders a minimum dividend upon the prospect of the future, so that they would be able to obtain loans for a certain number of years, and recoup themselves by increased profits for the losses which everyone anticipates, in a country situated as Ireland is, would in the first instance follow from a reduction of the freights. These are the only further observations which it occurs to me to make.

1848. (*Lord Donoughmore.*) Referring to the opinion which you expressed at the commencement of your evidence to-day as to giving further facilities to existing railway companies to make sidings and branches, I think you stated that the present system

W. T.
Mulvaney, Esq.

W. T.
Mulvaney, Esq.

10th May 1865.

entailed very great expense upon the companies?—Yes, as I understand it.

1849. Will you be good enough to explain what further facilities should be given, and upon what plan you would propose to decrease the expense of making sidings and branches?—The plan which exists in Germany is laid down by a universal railway law, that any such sidings or branches, or even a whole railway, is merely conceded by the Minister of Public Works and Commerce, after he has made the necessary investigation, almost without cost, and following his concession, which is approved of by the Crown. There is an expropriation of the land and all rights belonging to the railway system.

1850. Have the parties whose property would be expropriated by the operation of these concessions any power or right to be heard by counsel or witnesses against the project of a railway company?—They have only a right to be heard before the Ministerial department. There are official and impartial valuers, or arbitrators, named to value the property, and upon their valuation being made the concessionaires proceed with their works, and reference is then only made to the Minister, so far as my memory serves me.

1851. Is the decision of the valuers as to the compensation which the owners are to receive final?—Yes; subject, in cases of dispute, to an appeal to the Minister.

1852. There is no appeal made to a jury?—I think not.

1853. Do you think that in this country, where the people are free, and rather like to enjoy their property without let or hindrance, such a system would be borne, either in England or in Ireland?—I think that we do bear it at present, but not certainly without an appeal. There is an organized system, and in which I took part at an early period, for the purchase of property; it was adopted first on the River Shannon, and it is now prevalent all over Ireland, and that arbitrarily enables property to be taken.

1854. That is, after passing an Act of Parliament?—Yes; and I take it that that *modus operandi* for expropriating property will still continue in that country, I believe it does, subject to an appeal to the assistant barrister; but the great question is, not the question of expropriation, but the great expense which is incurred in parliamentary contests before the Act of Parliament is granted, or it may pass through unopposed, and it will cost more money than the siding that is wanted.

1855. Are you aware that a General Act was passed last session to give power to railway companies to construct works, subject to the approval of the Board of Trade, and without an Act of Parliament in cases where they obtained the consent of all parties?—Yes, and that might have the effect of debarring them from making those works; whereas in Germany, when once the concession is given, then the power of expropriation from the mode of valuing that exists there follows.

1856. Before a concession is granted to a railway company by the minister, do the persons whose property would be so expropriated receive notice of the intention of the parties to apply for a concession?—Yes; public notice is given in the newspapers that such a concession is to be applied for.

1857. Is it anything like the notice which is given in this country, notice being personally served on each owner, accompanied by a statement of the manner in which his property will be interfered with, the quantity of land proposed to be taken, and a sketch being given of the line, as intended to pass through the property?—I rather think that it is not in such detail, but full notice is given in the local papers, and persons who object can appear before the minister and state their objections.

1858. Is the minister assisted at all by a jury?—No.

1859. He alone is entirely responsible, and decides according to his will and pleasure?—No; he decides

according to the Act of Parliament, and I believe there is a general Act in Prussia with regard to the making of railways, giving powers and laying down the rules and regulations under which they shall be conceded.

1860. Do you think that any British subject would be content if a minister of the Crown, by his mere *ipse dixit*, were empowered to say that his property should be taken away from him whether he liked it or not?—I am not competent to give an opinion upon that, but if it is not so done, the system which prevails clogs your whole railway system with enormous expense. As I stated before, as far as I recollect the statistics upon the subject, the preliminary expenses taken together for the construction of railways in this country exceed the cost of all the railways in Germany.

1861. (*Mr. Ayrton.*) In Germany, I believe, they do not object to level crossings over any road?—They are nearly all level crossings.

1862. They do not make bridges over roads, even at the very entrance to a large town; they do not incur that expense?—The system of level crossings is very prevalent in Germany, and I must admit it is very much subject to complaint, and I think it is generally found now, where the traffic is increasing extensively, to be injurious, and that causes them to regret that another system was not adopted in the first instance.

1863. Do you not consider that the circumstances connected with the development of the coal traffic in Germany were quite exceptional, because the country is very cold during a long period of the year, there is very little fuel, and that is extremely expensive in many parts of the country?—No. The private consumption is a small matter in the whole affair, and it has not yet at all been worked up to the extent to which I believe it will come. Wood, I believe, is still burned from preference in Berlin and in various other towns. It is the manufacturing industry that has taken the greatest advantage of coal, besides which the collieries in Germany have been for a very long time in existence; vast numbers of them exist there, but the trade in coal was always limited from the want, I believe, of the means of transport.

1864. The cost of transport by land was so enormous that practically it limited the consumption of the coal?—Yes.

1865. They had to rely chiefly upon wood as fuel for manufacturing purposes and for domestic consumption?—Yes; before the railways were introduced, although within a few miles of the coal pits they were obliged to rely on wood.

1866. Therefore the construction of railways caused a sudden increase in the consumption of coal as fuel?—It did not do that, as I stated before, until the rates were reduced, for they burned wood in the locomotives in Bavaria, and in many other parts of the country they burned turf in the locomotives, in Bremen, and in many other parts of the country.

1867. (*Chairman.*) Would not your plan of raising money on terminable annuities add considerably to the charges upon railways at present?—No; my object is to reduce the cost.

1868. They would have to pay a higher rate of interest, would they not, if it was to be paid off?—No; not a higher rate of interest, for they would be gradually paying off the interest and the principal, but I was addressing myself to the question of the rates.

1869. (*Capt. Galton.*) If you can borrow money on a permanent annuity or a mortgage bond at 4 per cent., and you convert that into a terminable annuity, must you not pay something more than 4 per cent. during the whole time that that terminable annuity has to run?—Yes, perhaps 1 per cent. to a sinking fund.

1870. That would be a greater charge upon the railway company than the present mortgage debt, would it not?—Yes, and of course that would be a useful stimulus to them to develop the traffic. The proportion is very large of loan and mortgage debt to the share capital in Germany.

W. T.
Mulvaney, Esq.
 10th May 1865.

1871. (*Chairman.*) The latter is very small, is it not?—Yes. The alteration that I would make with regard to Ireland in its present difficulties, with a debt of about ten millions on the railways, is this: if that debt, instead of paying the present high rate of interest could be converted into a terminable annuity, and either guaranteed by the State or guaranteed to be paid off in 30 or 40 years, like the Drainage Loan in Ireland, it would be such a boon as ought to induce the existing companies to make some effort to obtain the increased benefits which would be derived from low fares.

1872. (*Capt. Galton.*) But that would diminish for some time, would it not, the dividends payable upon the shares?—No, they are paying interest now which is equivalent to what would make a sinking fund and pay interest.

1873. Do you mean if the Government gave a guarantee?—Yes; if you take it at $3\frac{1}{2}$ per cent. interest. I am assuming $3\frac{1}{2}$ per cent. for interest, and in this particular case of Ireland, that the debt was only to pay interest for the first five years during

the experiment, and that the repayment of the principal was only to commence from that day forward. It would be in that shape practically a great benefit conferred upon the present railway companies.

1874. (*Mr. Glyn.*) You would make it $4\frac{1}{2}$ per cent., including the interest and sinking fund?—Yes, after five years.

1875. (*Chairman.*) Do you think that parties would be found willing to make the experiment, to raise the loans, and then run the risk, during the first three or four years, of going without a dividend?—I have not the least doubt of it in this country; I find that the English railway companies are extending their traffic into Ireland, and very judiciously so; *i.e.*, the Western companies into the south of Ireland, and the North-western from Holyhead into the north; and communications may be made from other railway companies, and these very railway companies might lease the Irish systems of railways or portions of them, and still keep up that same spirit of competition which I think is so desirable for the future benefit of the public in Ireland.

The witness withdrew.

Friday, 12th May 1865.

PRESENT :

HIS GRACE THE DUKE OF DEVONSHIRE.
THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
J. A. ROEBUCK, Esq., M.P.
T. B. HORSFALL, Esq., M.P.
ROBERT DALGLISH, Esq., M.P.

GEO. CARR GLYN, Esq., M.P.
A. S. AYRTON, Esq., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, Esq.
J. R. MCLEAN, Esq., Pres. Inst., C.E.
W. POLE, Esq., F.R.S., *Secretary*.

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. WILLIAM KIRBY SULLIVAN called in and examined.

1925. (*Chairman*.) You are professor of chemistry to the Museum of Irish Industry at Dublin?—Yes.

1926. Has your attention been much directed to the subject of Irish railways?—Yes, especially in connexion with the transport of mineral products.

1927. Do you wish to confine your evidence solely to Irish railways with reference to mineral products?—I should like also to offer some evidence with reference to agriculture.

1928. Are you prepared to give evidence generally upon the subject of Irish railways?—I am.

1929. Do you consider that the fares and rates of carriage for goods and parcels charged in Ireland are injurious?—I do.

1930. Do you consider that the produce of the mines and quarries and agriculture generally would be greatly benefited by a cheap scale of fares and rates?—Certainly.

1931. Are you of opinion generally that cheap rates and fares would stimulate trade?—Yes.

1932. Will you state your opinion as to the effect which you think will be produced by the diminution of fares?—I believe that the first effect would be a considerable development of mining; I also think that agriculture would be very considerably benefited, especially in the portions of the country which are most backward because most distant from the markets; I believe as there is now a tendency to engage in manufacturing industry in Ireland, more than perhaps has existed for 20 or 30 years, that it will greatly stimulate that tendency.

1933. Are there any facts upon which you ground your opinion, that a diminution of fares would be accompanied by a large increase of traffic?—I will first direct the attention of the Commission to two cases in connexion with mining, which will show what is the influence of the present rates of transport upon that branch of industry; I may observe that although we have a great number of mines in Ireland, they are not very rich and they are scattered through the country, many of them only giving produce of a low value, as, for example, sulphur ore, iron ores, and zinc ores. The present rates which are charged upon these products are exemplified in the case of the Wicklow Copper Mining Company. The Vale of Avoca is the centre of the largest sulphur mining operations perhaps in Europe. Formerly copper was extensively obtained there, but latterly, say for about the last 20 years, the sulphur ore has been the chief product, and from 80,000 to 120,000 or 130,000 tons annually have been exported. Iron ore is also found there in great abundance, and is now extensively worked. The distance from the Vale of Avoca, where the mines are situated, to the stations at Kingstown is 39½ English miles, and the charge for the sulphur ore to that point

is 4s. 3d. per ton, making consequently a rate of something more than 25 per cent. of the total value of the product, which is 16s. per ton free on board.

1934. (*Earl of Donoughmore*.) That includes terminal charges?—Yes; the railway charge upon the iron ore is 3s. 9d. per ton.

1935. (*Chairman*.) Where is that from?—From the same locality to Kingstown. I take Kingstown, in the case of the sulphur ore, rather than the Harcourt Road Station, because practically very little except the local consumption of Dublin itself would be delivered there; 3s. 9d. per ton upon iron ore is very nearly 50 per cent. of the total value, because they have to pay, besides the 3s. 9d. for the carriage of it to Kingstown, a charge of 3d. per ton for taking it from the depôt at the mine to the station itself; so that virtually the charge is 4s. or exactly 50 per cent. upon the total value. Independently of the more valuable ore, there is an article called “smalls,” which are the broken pieces, the value of which is only 6s. per ton, delivered free on board. They cannot send that at all, because the charge would be the same for that as upon the ordinary sulphur ore. It would be 4s. 3d. per ton to Kingstown, leaving, therefore, only 1s. 9d. as the margin for cost of production and profit. So that the present charge would be 72 per cent. of its actual value. The produce of this one mine for the year ending the 1st of March, 1865, was, of common pyrites, 30,600 tons; and of iron ore, 15,164 tons. The total produce being 56,576 tons.

1936. Then you include some other item?—I have included all the other varieties of ores which have a higher value, and therefore do not come under the categories which I have mentioned. I have included the copper ore, and a portion of the deposit of copper; which make a total of 56,576 tons. That produce could, were it not for the charges paid, have been raised to a very great extent. The company had, I am informed, contracts for this year which would have enabled them to sell 80,000 tons altogether of ores from that single mine, but they could not fulfil them, owing to the difficulties with the railway company. The “smalls” are of course not sent at all. There is one other port to which ores are sent, which is only 6¼ miles distant, namely, the Port of Arklow, which is only available in the summer months in consequence of the bar.

1937. (*Earl of Donoughmore*.) In point of fact it is not a port at all. It is only an open roadstead?—It is an open roadstead. The charge to that place is 2s. 6d. per ton for the 6¼ miles, or about 4·8 pence per mile. On the 9th of May, in consequence of those charges, and the difficulties with the railway, the mining company had 120 carts carrying ore to Arklow, having thrown the railway company overboard

Mr.
W. K. Sullivan.
12th May 1865.

Mr.
W. K. Sullivan,
12th May 1865.

altogether, finding it cheaper to deliver it in that way at Arklow, than to take it to Kingstown.

1938. (*Mr. McClean.*) Is there a tramway to Arklow?—The tramway was made originally by Mr. Hodgkin, but it has been sold to the railway company.

1939. (*Mr. Horsfall.*) Which railway company is it?—The Dublin, Wexford, and Wicklow Railway Company. I may add that that is not the only loss which the Vale of Avoca as a mining centre suffers, because we lose the advantage of return freights from the coal trade. The coal vessels coming into Dublin are obliged to return chiefly in ballast; of course they do not go to Arklow, and so the mining company loses the advantage of that return freight which the delivery in Dublin or Kingstown would give them; and now that we are to have a line of screw colliers, the advantages of return freights would be more certain.

1940. (*Chairman.*) Do you know whether the Wicklow Copper Mining Company have ever made a representation to the railway company upon the subject of their charges?—Yes.

1941. (*Mr. Glynn.*) Have they refused to make any reduction?—They have refused the offer made to them by the mining company.

1942. (*Mr. McClean.*) Do not the mining company pay a very high dividend?—They do.

1943. And the railway company a very high one?—Yes; that railway is perhaps the one which pays the best dividend in Ireland. As I have no direct interest in either the railway or the mining company, I have mentioned the case only as an illustration of the influence of the cost of transport upon our mining. I can also mention other cases.

1944. (*Chairman.*) There are mining companies in the Vale of Avoca besides that, are there not?—There are several. There is another district, the traffic of which comes upon a different line. It would be one of the largest mining districts after Avoca itself; it is in the centre of Ireland, in the county of Tipperary, where the influence of the cost of carriage is still more important upon the produce, namely, the district of the zinc mines near Nenagh. The ore is peculiar there, a portion of it is very rich, quite as rich as that of the zinc mines in Germany or Belgium, but a large portion is also mingled with ochre, which has to be removed by an expensive process of washing, and the consequence of that is, that a large portion of it cannot be transported at all. In one month the net return of the mine was 307 tons, valued at 692*l.* 8*s.*, and the cost of the carriage was 217*l.* upon that. The total quantity of zinc ore exported in 1864 was 3,500 tons, and of fire clay 100 tons, so that the total sent by rail was 3,600 tons; and there was brought from Waterford 500 tons of coal. The total tonnage of ore, coal, and fire clay was, therefore, 4,100 tons. This is exclusive of stores and of other ores.

1945. Where was the carriage to?—That is a good illustration of our railway system. The nearest port would be Limerick which is not many miles distant, but they are obliged to carry to Waterford. It costs about the same to Waterford, to Cork, or to Dublin. Limerick is nearer, but they cannot take it there, and the cause of that is that there are no railway wharves, therefore the cost of taking it to Limerick would be greater in consequence of having to cross the city than it would be to send it on to Waterford.

1946. Do the railways come nearer the wharves at Waterford than Limerick?—They come alongside, which makes it more economical for them to send it to Waterford than to Limerick, although the distance is nearly three times as great.

1947. The charge is something like 15*s.* a ton, is it not?—No, the charge compared with the usual charges is moderate enough, because they have more facilities for carrying it up to Waterford. They carry it at 6*s.* per ton; the charge of 15*s.* includes the freight to Swansea.

1948. What is the railway charge?—It would be 6*s.* per ton.

1949. How many miles?—It is about 80 miles from Limerick to Waterford.

1950. (*Earl Donoughmore.*) What is the station?—The station is Bird Hill. The chief difficulty is that the Bird Hill station belongs to the Waterford and Limerick Company; and the mines are several miles distant from it; so that there is a large expense in carting the ore to the Bird Hill station. They are only about a mile and a half from a branch of the Great Southern and Western, which runs from Nenagh to Bird Hill. Looking to the access to that district by the other line the Great Southern and Western very naturally did not like to go to the expense of a station at Shallee, for which they would have to pay all the expense, and only be benefited by the receipts of two or three miles; so that the existence of the two companies on the one line of communication threw a great obstacle in the way, and raised the traffic charges very considerably.

1951. (*Chairman.*) Are there any other mines that you wish to call the attention of the Commission to?—I should say that the limit of production in those mines will not be reached for very many years. I have been down in the mines myself, and I know what the extent of their production is; and I must say that if there were facilities of transit given at a cheap rate, say at half of the present rate, I am sure the quantity of ore which would be sent would be certainly three times what it is at present.

1952. Do you think it could be put on board ship for 3*s.* a ton?—I think it could, and that would leave a considerable profit.

1953. Is the production from the mines capable of being rapidly increased?—Very rapidly indeed. All the investigations, as far as sinking is concerned, are made, and the levels are driven through the mass of the ore, so that at any time the amount that could be raised may be easily calculated.

1954. Would it not be for the interests of the mining companies themselves to promote a branch line from their mines to one of these larger railway companies?—That is exactly the very point at issue now.

1955. Have the mining companies themselves ever promoted a tramway to one of those lines?—If they could get a station upon the Great Southern and Western they would I have no doubt make a tramway, because they would be able to bring the waggons upon the railway loaded, but the obstacle in the way of that being done is that there are two competing lines just at that point, so that the line which has the station and which would have to give them the right of running their carriages over it is precisely that which would have the least benefit from it.

1956. (*Capt. Galton.*) What is the value of this ore at the market at which it is sold?—The poorer ore which exists in the largest quantity could not realise more than about 30*s.* per ton.

1957. Sold where?—Sold in Swansea.

1958. What does it cost to raise that ore in the mine itself?—The cost is very considerable. I could scarcely enter into it now. All that I can say with regard to that at present is that it would not pay to send the ore.

1959. But they do raise it now?—No, they only send the richer. Considerable quantities of inferior qualities are obtained in the dressing of what is raised, but the poorer ores are not at present raised where it can be avoided.

1960. Are the mines deep?—Some of them are deep. They go down to —

1961. Do they run into the side of the mountain at all?—Not this particular mine. The better ores would fetch from 42*s.* to 46*s.* per ton.

1962. (*Chairman.*) How much do they send in the year?—They cannot send the poorer ores at all, because there would be no margin for profit. Suppose the freights had been reduced to one half what they are at present there would have been a margin of 1148*l.* upon the zinc traffic arising from the operations of last year.

1963. (*Capt. Galton.*) What is the freight from Waterford to Swansea?—About 2s. 6d. per ton.

1964. And the charge by railway is 6s. per ton?—Yes.

1965. Therefore it would cost 21s. 6d. to raise the ore on the spot?—You have always to add the cost of transport to Bird Hill station.

1966. What distance is that?—About six miles.

1967. What would they convey that at?—It would be at least 6d. a ton per mile. I believe it actually costs 3s. 6d. per ton.

1968. That would be about 19s. per ton?—Yes.

1969. And it would cost that to raise the material?—It would cost that. They would have to dress it.

1970. What is the process?—They have to crush it, and then they have to subject it to a very elaborate series of washings so as to remove the whole of the ochre.

1971. Has it to be subjected to any heating process?—No. An attempt is about to be made to convert it into oxide of zinc so as to diminish as much as possible the weight of stuff which is to be sent to the smelting works in Swansea.

1972. If they could get coal at moderate prices would it be worth while then to reduce it on the spot?—Not perhaps to reduce it but to make oxide of it.

1973. At what price ought the coal to be in order to enable them to do that?—I have not made the calculation and it will be a very difficult matter. I should not like to venture just this moment to say what it would be. In fact the experiment is in process of being tried and it might be premature to say what would be the effect, but I know that the charge upon the coal is itself an obstacle to making the attempt.

1974. (*Mr. Roebuck.*) Is there any use made of the ochre?—As yet none, most of it is run into the river.

1975. (*Mr. Horsfall.*) I think you stated that it would pay the companies to carry this ore for 3s. per ton for 80 miles?—It would. If it had been carried at 3s. per ton instead of 6s. it would have given a margin of profit on the operations of 1864 of 1148l.

1976. (*Chairman.*) A profit to whom?—To the mining company on their zinc ore.

1977. (*Mr. Horsfall.*) Have you entered into any calculation as to what would be the profit to the railway company at these rates?—I have not, because I consider that the increased produce that would be raised from the mine would give them a slightly higher interest than they have at present.

1978. Do you know what the expense of working the line is, how much per mile?—The working expenditure on the Waterford and Limerick line was 301·39l. per mile for 1863.

1979. What is that per ton?—That includes their whole working expenditure. I have not the means of determining the cost of the goods traffic per train mile.

1980. What proportion of that 3s. per ton would fall on the company who work the line?—Considering that they have a sufficient rolling stock to do the work at present, and that they would bring back a considerable portion of coal, I do not think the increased expense would be very much. I do not think the increased quantity would be any additional expense at all.

1981. (*Mr. Glyn.*) They would carry in fact full loads?—Yes.

1982. What increased produce must the mining company give to allow that reduction of the railway rate?—If it reduced it to half, the mine should give double the produce, for instance, the 307 tons ought to be 614 tons.

1983. You have no doubt at all of the capability of the mine to produce a very much larger quantity?—I have a perfect certainty of its being capable of producing a three times larger quantity with the greatest facility.

1984. Therefore in point of fact the directors of the mining company could make a contract with the railway company for the delivery of a certain quantity,

provided they reduced their rate?—I am quite certain they could do that, subject of course to the variation of the market in England.

1985. (*Capt. Galton.*) How far are they now from the River Shannon?—They are, at present, not more than 9 or 10 miles from the River Shannon, but between them and the Shannon is a range of mountains, or rather high ground, lying between Nenagh and Killaloe.

1986. Is it not less expensive to them to get down to the Shannon, and go to Limerick that way?—Much more expensive, in consequence of the carriage across to the river, and then of course there would be the transshipment on board, and a second transshipment again on the Shannon itself. If there was a railway wharf at Limerick it would be very easy to send it down to Limerick, which would reduce the rate to one-third. It would be quite possible to send to Limerick if there was a railway wharf there at the rate of 2s. per ton, which would be one-third of the present rate.

1987. (*Chairman.*) Is there any extension of wharves at Limerick in contemplation at present?—I do not think that in the present condition of Irish railways, unless some change is made by amalgamating them all, any extension of that kind is contemplated, except perhaps in Dublin. With regard to Dublin, the change will be made, because a Bill has passed which will connect all the docks, which are now more or less useless, with the railways; there is a circular railway for that object. That is the only case of a railway wharf being proposed that I am aware of in Ireland, and I am not aware that it is contemplated to do so in either of the ports of Waterford, Cork, or Limerick.

1988. If the railways to the south of Ireland were amalgamated, do you think it would be for their interests to make a branch into these mines of which you have been speaking?—I certainly think it would.

1989. What saving would there be in that distance between the mines and the Bird Hill station?—The saving would be fully 2s. per ton, allowing a large margin for filling and other expenses.

1990. Would the freight from Limerick to Cork be the same as from Limerick to Waterford?—About the same, because you can get a chance of return freights. It would be to the interests of the company to own the vessels themselves, and in fact to bring back coal in return.

1991. Do you know whether the Great Southern and Western have ever considered the practicability of carrying the ore on their own line to Cork, with the view of shipping it there?—It would be too great a circuit, because they would have to go back to the junction upon the main line, and then carry it for nearly double the distance on their Cork line. In order to get to their Cork line through Limerick they would have to pass over two lines; they would have to pass over the Waterford and Limerick and the Foynes Railways.

1992. (*Capt. Galton.*) Are those two lines worked by independent companies?—Yes. The Great Southern and Western Company have running powers over the Foynes line from Patrick's Well to Limerick.

1993. (*Earl Donoughmore.*) I suppose if the Great Southern and Western Company had a station at Shallee to accommodate this Calamine Mine, that they could charge the maximum rate under the six miles clause for going to Bird Hill?—They could.

1994. Have the Great Southern and Western Company ever made any proposal to the promoters of those mines to take their ores for them to Dublin?—I do not think they have, because the mining company never contemplated going to Dublin in consequence of the absence of a railway wharf, but perhaps that would be remedied by means of the new line connecting the railway termini in Dublin. The cost of transport to the Great Southern and Western Company of their own coal, in consequence of the absence of wharves, amounts at present to about 1s. 9d. per ton. That is the actual cost of the carriage from the

W. K. Sullivan.

12th May 1865.

Mr.
W.K. Sullivan.
12th May 1865.

ship's side in Dublin to the Great Southern and Western depôt. The cost of the transport of ore would of course be equal to that. Then there is the loss sustained by carting it across Dublin, which, from the ore being so to speak in a state of mud, would be very considerable; the loss on the ore as it is, amounts to nearly three per cent.

1995. (*Mr. Horsfall.*) You spoke of the export of sulphur as being between from 120,000 to 130,000 tons. To which port is that exported?—To Liverpool and Glasgow.

1996. (*Mr. Glyn.*) I understood you to say that if a communication was made between the termini of Dublin by the Great Southern and Western, it is probable that it would all come by that route?—I am quite sure that it would be more economical than by the present system; but evidently as branch lines do not intervene, if there was only one company to deal with, and the same facilities were offered in Cork as in other markets, it would be cheapest to send it by Cork. If you have a separate large coal trade with South Wales it would give a back freight.

1997. I suppose the general freight is a little more for the Welsh ports?—The Great Southern and Western coal costs 3d. per ton less at present delivered in Cork than in Dublin.

1998. (*Chairman.*) The charges for the minerals that you have alluded to on the Irish lines are larger than the charges usually are in this country for mineral ores?—They are, because the mines are situated in a very different way from the English ones. Ours are scattered about, and the produce has all to be brought to a central point, whereas in England the greater portion of the ores of low value lie round the districts where they are smelted, and consequently are carried on a very large scale.

1999. Is the rate per mile higher in Ireland than in England?—Yes, because in Ireland the carriage of these ores has never really been developed in consequence of the scattered position of the mines, and it being impossible to make a rate for them. They are included in the general merchandise and goods at ordinary rates.

2000. Have there to your knowledge ever been any negotiations between the railway companies and the mining companies to get up a traffic of that kind?—There is that particular case of the Vale of Avoca. The Wicklow line was made through the Vale of Avoca under an impression that one of the chief sources of revenue would be mineral traffic; that, in fact, it would be a mineral line.

2001. (*Capt. Galton.*) Who finds the waggons?—The railway companies in all cases in Ireland.

2002. (*Earl Donoughmore.*) Do you know anything of the port of Wicklow?—Something.

2003. That is not so bad as Arklow?—It is not so bad as Arklow. Ores were formerly carried to Wicklow when the carts were used.

2004. Are you aware that before the railway was constructed there was a great deal of the sulphur carried by the shipping?—Yes.

2005. Are there no facilities for the shipping of ores at the port of Wicklow now?—I believe they are shipping from Wicklow, as far as the return freights will enable them. The great advantage which was expected to arise from the line to Kingstown was the existence of a large fleet of return vessels, which would have carried it back in place of ballast. Now there is a very active competition in sulphur ore, a very superior quality being brought from Spain, and even from Iceland; so that it is a trade in which there is a very active competition indeed.

2006. (*Capt. Galton.*) Are those ores superior to the Wicklow ores?—Yes; because of course they will only carry that portion which is superior from a great distance.

2007. (*Earl Donoughmore.*) Is it not the fact that Sicily is a country from which an important part of the sulphur is derived?—Yes; but since the differences arose, about 1840, between the King of

Naples and our Government the importation from Sicily has very much diminished. A very large portion of the sulphuric acid of Great Britain is now made from pyrites, and it is owing to that that we are enabled to carry on a large chemical trade even in Dublin itself.

2008. Are there chemical works in Dublin?—Some of the largest works for the manufacture of bleaching powder in the United Kingdom are in Dublin.

2009. Do they use this material which you speak of?—Exclusively; it is in fact owing to the advantage of having it that such a trade has been enabled to grow up there. First, one large works was built, and then another; and I believe a third will be built soon. Besides that, there are two manufactories for oil of vitriol using chiefly pyrites, and only a very small portion of sulphur.

2010. (*Mr. Glyn.*) This is in the face of these high rates?—It is.

2011. (*Chairman.*) Are these mines which you have spoken of in the principal mining districts in Ireland, or are there other mineral districts of importance?—There is one other large district, which is near Carrick-on-Shannon, containing iron ores and a coal field. The iron ores there are extremely rich, but the coal is not very good; and though abundant enough for a local trade it could scarcely ever become the basis of large smelting operations; some furnaces were erected there, but they are not now worked. I have no doubt that if facilities existed for transmitting the ore to Dublin, even at the present prices, that it would pay to take it from Lough Allen to Carrick-on-Shannon.

2012. There is a railway communication now from Carrick-on-Shannon to Dublin?—There is; but the charges at present would preclude the possibility of sending the ore that way.

2013. Do the railway companies think it would not be to their interest to charge such rates as would enable them to carry this iron ore to Dublin?—If the traffic were to come into existence the railway companies, I daresay, would reflect about it, but it is the absence of the traffic which prevents them thinking about it.

2014. Are the mines at Lough Allen worked to any extent?—Not at all; an attempt was made latterly to send some portion of the ore to England, but I do not think it was very successful.

2015. Do you know what description of ore that was?—Clay-ironstone of very superior quality.

2016. (*Mr. Glyn.*) Do you not think that the communication about to be made between the several railways of Dublin and the quays will obviate a great many of these objections?—It will; but obstacles will still exist from the number of different companies.

2017. The cost of carting from the termini to the quay in Dublin must in point of fact be prohibitory?—Quite so.

2018. Therefore many of the railway companies could scarcely have thought of the traffic as a remunerative traffic?—It would in any case be a speculative traffic, even though a person who is perfectly acquainted with the resources of any mineral district may know how far they could be developed. I am quite certain that it would ultimately pay, yet you cannot expect that twenty Boards of Directors, or even five or six, would all agree that that speculative hope would be fulfilled. Consequently, they will not make any improvements, especially in the presence of their shareholders, who, with a diminution of their passenger traffic, and a diminution of goods traffic, are afraid to make the slightest change of any kind.

2019. (*Mr. Hamilton.*) Has there been a decline of the traffic?—Yes, a steady decline both in passengers and goods traffic upon all the Irish lines.

2020. According to a parliamentary return which I have before me there was an increase comparing 1862 with 1863. Has the decrease taken place in 1864?—If you take the whole series of years you will find that the total receipts per mile will show a de-

crease. It will not do to take the total receipts of the number of miles open; the mileage receipts must be taken; thus, in 1859 the receipts were 1024*l.* per mile per annum; in 1860, 1003*l.*; in 1861, 1017*l.*; in 1862, 904*l.*; and in 1863, 872*l.*

2021. (*Capt. Galton.*) That is the receipts per mile?—Yes.

2022. The mileage has increased; but the traffic has not increased in proportion to the mileage.—Exactly.

2023. Had any comparatively unimportant lines been opened in the interval on which the traffic was small?—A few branches but not any very important lines.

2024. (*Lord Stanley.*) Your theory is that the lines not paying better than they do is due to the rates of fares adopted being too high?—Certainly. If you draw a line from the north of Ireland, say from Londonderry to Cork, you will divide the country into two portions. The greater part of the population west of that line is extremely poor, and cannot afford to travel; owing to the peculiar organisation of the agricultural classes there, the small farmers have scarcely any ready money, and the labourers have no wages, and therefore both have no money to travel with. A considerable change is now taking place in the country, wages are more frequently paid in money, and are gradually increasing, and although the population is diminishing, and there is a decline of traffic upon the whole of the railway system, I have not the slightest doubt that if the fares were reduced there would be a proportionate increase of the traffic.

2025. How is it that railway companies who are in all other countries supposed to be the best judges of their own interests have never seen the matter in that light?—Some do see it in that light and some do not. It happens that there is a greater conflict of opinion in Ireland as to what measures would benefit the country than any other country in Europe, and that conflict of opinion has been very injurious to the country. One set of persons will tell you that there is only one remedy, and another set will argue that there is no remedy at all; that the resources of the country are limited and are rather decreasing; and if you were to halve the fares you would only halve the receipts and that you would not get more traffic.

2026. (*Mr. Glyn.*) All the directors appear to be of that class?—I should think not.

2027. None of them have reduced their rates?—I have just heard that the Wicklow Company have reduced their rates to the original fares that were paid on the Dublin and Kingstown line.

2028. For passengers?—Yes.

2029. How long has that reduction been made?—Only since the present movement with regard to railways began.

2030. (*Chairman.*) Then that experiment has not been tried sufficiently long to know what the final effect of it would be?—No; but Mr. Dargan's intention is, I understand, to propose a very considerable reduction of fares and rates. The present condition of things in Ireland, I am sorry to say, is such as nearly to paralyse any bold speculative effort of that kind; when you have to deal with so many different interests, however speculative a man may be, he cannot carry it out. A man like Mr. Dargan would of course see the probability of success clearly.

2031. Do you think that that difficulty would be diminished if the total number of companies to be dealt with were smaller?—Or better, if the original plan when railways were first contemplated in Ireland were carried out, of having one central administration.

2032. One company for the whole of Ireland?—Yes; or some arrangement by which the traffic rates and the existing fares might be regulated by one company. I have no doubt that with a limited board they would see that their interest is clearly to develop the traffic within the area which feeds each line.

2033. (*Lord Stanley.*) Whether you have one company or many, would not the same difficulty arise that exists now, that whatever ultimate gain there might be there would be a considerable temporary

loss, and the shareholders who might possibly not intend to retain a permanent interest in the concern would not be prepared to incur that loss for the sake of the ultimate benefit?—I daresay that there would be a certain loss in the first instance; but there would be some gain from the amalgamation by lowering the cost of administration, and perhaps the traffic expenses also would be diminished somewhat, which might in part compensate for that loss. I have no doubt there would be for some time a loss, but there would ultimately be a proportionate gain.

2034. (*Chairman.*) Have you reason to believe that there is room for any considerable reduction in the cost of management and in the conduct of the traffic?—Perhaps not much; the traffic as a rule is economically conducted on the Irish lines. The total working expenses might perhaps, by consolidation of all the railways, be reduced to 39 or 40 per cent.

2035. Is not the cost of management a very small percentage?—It is not a very large item. The proportion of working expenses to total income in 1860 was 45 per cent.; in 1861, 44; in 1862, 48; and in 1863, 49.

2036. (*Mr. Hamilton.*) Will you give what it is per train mile?—The expenditure per mile in 1860 was 456*l.* 8*s.*; in 1861, 451*l.* 2*s.*; in 1862, 436*l.* 6*s.*; and in 1863, 431*l.*

2037. Is that per train mile?—Per mile of line opened. I have not calculated the amount per train mile for all the Irish lines, but on the Great Southern and Western it was about 2*s.* 4*d.* in 1864. This would not be far from the general average for the entire of the Irish lines.

2038. (*Chairman.*) Are there any companies working as low as 39 per cent. in England?—Not in England.

2039. Or elsewhere?—Yes. Some of the lines in Belgium and Prussia. The working expenses on the Cologne and Minden line I think are as low as that. The expenditure of the Cologne and Minden line was in 1861 39·75; this return includes not only the amount of the working and traffic expenditure but also the cost of management, rates, taxes, and everything included, in the same way as they are in the usual returns of the English and Irish lines. The Cologne and Minden line is not a small line, but a line of 301 English miles.

2040. You have spoken chiefly with reference to the possible development of mineral traffic; do you consider that there is also a possibility of a great increase in the passenger traffic and in the carrying of agricultural produce in Ireland?—I have no doubt whatever as to that. The one great obstacle which I have always seen to the increase of passenger traffic in Ireland, as far as the third-class passengers are concerned and a portion of the second, arises from the small incomes of the persons who form those classes. A portion of the people do not go at all upon the railways in Ireland. They cannot afford to pay the fares, and they will walk 30 or 40 miles rather than go upon the railways, because the fares would be greater than they could possibly afford. In one half of Ireland the agricultural labourers receive no money-wages but are paid in kind; that is to say, they get a piece of conacre land or receive the grass of a sheep and matters of that kind as wages; they scarcely ever have any money. The only money that they do see is what they receive for eggs, butter, and things of that kind that are taken by the carts going along the road. The development of a system of cheap parcel traffic rates upon the Irish lines would be one of the greatest benefits to the whole district to which I have alluded by giving these people small sums of money.

2041. Do you think that the passenger fares could be reduced sufficiently to enable these very poor people to travel upon the railway?—I am quite sure it would now compensate them to pay half the present fares in order that they themselves may sell their eggs and other produce at a large market town. There is a system of huckstering going on along the road. They sell their goods to hucksters instead of

Mr.
W. K. Sullivan.
12th May 1865.

Mr.
W.K. Sullivan.
12th May 1865.

sending them by the rail. I was greatly struck with an instance of that in the north-west corner of Ireland, during this past year, where I saw immense quantities of cabbages in all the small plots of land in the county of Mayo and North Galway absolutely rotting, when in Dublin we can hardly get it. The working classes there are really very badly off for them. It is a curious fact, that Dublin now supplies a great deal of vegetables to Belfast, Glasgow, and Liverpool, indeed a large portion of the cabbages produced there are shipped away. I asked one of those people why he did not send his cabbages to Dublin. He was a peasant who was in the habit of visiting England during the harvest, and he told me that the thought had struck him already, and he had made a trial, that is to say, he had made inquiries at the railway station, and he found that the cost of transmitting half a ton or a ton of his cabbages, having to send them there without knowing much of Dublin arrangements, would be more than the total value.

2042. (*Mr. Glyn.*) What would the charge per ton be to Dublin?—The charge from the point I am speaking of would be, at the lowest rate charged for any merchandize, 11s. per ton; I do not think, however, that cabbages would be carried at the lowest rate.

2043. By the railway company?—Yes.

2044. You think that if they were taken at half that charge it would pay the company?—Yes, certainly.

2045. What is the distance?—The distance is about 130 miles to the place I am speaking of. I know a gentleman in the county of Wexford, who is in the habit of sending crops of that kind to Dublin at the rate of 8s. 9d. per ton.

2046. (*Capt. Galton.*) Would it be possible for the railway company to carry goods of that sort, for which they would be liable in case any damage should occur to them, at such a low rate as 6s. per ton for 100 miles?—I have no doubt that it would be, considering that their waggons are half empty. The average load of a goods train in Ireland is not more than 42 tons.

2047. (*Mr. Glyn.*) It would all serve to make up a train load?—It would.

2048. (*Capt. Galton.*) With reference to your remark that the passenger traffic had decreased in Ireland, you did not mean that the total number had decreased, because I find from the return that the numbers of those who travelled in 1863 as compared with 1862 were 1,140,000 as compared with 1,000,000, but that the mileage had increased from 1,400 to 1,600 miles. Therefore, while the passengers had increased one-tenth the mileage had increased one-seventh?—I did not. I have no doubt that the number of passengers will continue to increase.

2049. Do you think that there will be a large traffic in people who wish to carry their produce to market towns so as to enable them to sell it in those towns instead of to the hucksters as you have described?—I have no doubt of it.

2050. What sort of fare would enable that to be done?—I should say that it ought to be done at a halfpenny per mile for the third class. One penny is the present rate for the third class, for no reduction is made upon return tickets. The third-class passengers are excepted in Ireland from the advantages of a return ticket, so that the man who makes a journey of 20 miles to a particular place and returns, pays 40d., whereas the second-class man only pays 45d. for the same distance, which is only one-eighth of a penny per mile more.

2051. (*Mr. Glyn.*) You would say it should be a half-fare for a certain distance?—Yes, I should say if it were reduced to $\frac{1}{2}$ d. per mile that that would be within the income of a very large number of persons.

2052. (*Chairman.*) Has the experiment ever been tried on any line in Ireland of the effect of low fares?—The only case which would afford an answer to your question that I can recollect is that of the Foynes line. I do not know whether it is quite to the point. The circumstances of the Foynes line were these, that

they increased the fares both on the Foynes line, and on the steamer which was connected with it. The increase was put on in the year 1863; in the year 1862 the total numbers carried were 87,256.

2053. Will you state what the fares were then?—The fares were raised to Rathkeale, which is an important market town, from 2s. 6d. first-class, 1s. 10d. second-class, and 1s. 1d. third-class, to 2s. 10d. first-class, 2s. 2d. second-class, and 1s. 5d. third-class. The total numbers carried to Rathkeale in 1862 were 87,256; in the year afterwards, when the increased fares came into operation, they fell to 71,383; and in 1864, to 63,046. A little steamer connected with the line and carrying passengers from Foynes to Kilrush which was called the Kelpie, during the four and a half months of the summer of 1858 was plying at opposition fares of 1s., from Limerick to Kilrush, and she carried 14,047 passengers, producing 1,358l., which would give for the half year 18,729 passengers, or 1,810l.

2054. What season of the year was that?—The summer season; the traffic of that line is chiefly a pleasure traffic. Kilkee, to which the passengers repair from Kilrush, is a considerable bathing station.

2055. (*Earl Donoughmore.*) A sort of Rams-gate?—Exactly. The numbers for the half year ending 31st December 1859, which is the next season after the opposition fares had been in operation the fares were raised to 3s., 2s., and 1s., were 14,997 passengers, producing 1,702l.; and in the two last seasons, the fares being 4s., 3s., and 2s., the numbers were for the half year ending 31st December 1863, 8,304 passengers, producing 959l., and for the half year ending 31st December 1864, 10,362 passengers, producing 1,138l., so that it would thus appear that a reduction of more than one-half produced exactly the same amount as did the very highest fares that they charged.

2056. (*Mr. Horsfall.*) Have they no low fares upon market days in Ireland?—I only know of three places where there are such trains. In the neighbourhood of Belfast they run one on the Banbridge line; on the Waterford and Limerick there are three each week from Carrick-on-Suir to Waterford; on the Cork and Passage there is a Saturday market train.

2057. What is really the reduction?—On the Cork and Passage line I think a return ticket is issued at a single fare. I do not know what the reduction is in the other cases. Special trains are sometimes run on fair days on many Irish lines, but the usual are I believe always charged.

2058. (*Mr. Glyn.*) If the third-class fare were reduced would it not give an opportunity to the people to go to market and sell their produce themselves instead of selling it to hucksters on the road?—I think so; and that such a reduction, coupled with a reduction of parcels rates, would greatly assist the development of trade in Ireland. At present persons who send butter from the counties of Wexford and Wicklow to Dublin, are charged as much for three cools of butter (a cool is a sort of tub in which they send it) as for one; and the same rule applies to return empty cools. A large trade has sprung up between Cork and Dublin in butter, and those who send it are small farmers. It is a very peculiar trade, and being unsalted butter it will not keep very long. The day before I left a person who is a farmer, and who first established the trade, came to Dublin to see whether he could do anything with regard to the rates at which it was carried, and he found it impossible to get any reduction from the company.

2059. (*Chairman.*) Is the butter trade restricted in consequence of the high fares on the railway?—It has a great effect upon the price in Dublin.

2060. (*Capt. Galton.*) What is the price of butter in Dublin?—The price at course varies, but that butter sometimes comes up to 1s. 6d. per pound. It is a trade which has grown up gradually, and is now very considerable.

2061. It is a great export trade, is it not?—This is a particular kind of Cork butter, in fact, there are two kinds of Cork butter. The export trade in Cork, salted butter is about 1,000,000 firkins per year; but there is a fresh kind of butter in which there is a considerable trade; it is of a better kind than the other.

2062. What does the other good butter sell at in Dublin; is that dearer or not than the other butter?—We do not get any of the other butter at all from Cork.

2063. I am referring to that which is sent to the market of Dublin?—That is dearer.

2064. What is the price?—The price varies from 1s. 2d. to 1s. 6d.

2065. Of the 1s. 6d. per pound for the best Cork butter what is due to the carriage; what does it cost to convey a certain number of pounds from Cork to Dublin?—That particular kind of butter must be sent in small parcels because it does not keep, especially in summer, therefore it must be sent every day. The parcels rate upon the line are very high. There are between 30 and 40 dealers in Dublin, each of whom receives his parcels separately.

2066. Would a parcel weigh between 30 and 40 pounds?—Some would weigh only 20 pounds, some 15 pounds, and some as little as 12 pounds. The distance from Cork is 165½ miles, and the rate upon a parcel of 14 pounds is 1s. 3d. up to 100 miles.

2067. Then it will not be above 1d. per pound upon a parcel of 15 pounds weight?—It would only be 1d., but there are other charges.

2068. Do they deliver it for that?—Yes, they deliver it to certain places for that; not to all.

2069. What reduction could be made which would make any appreciable difference in the price of the butter?—They could reduce it to one-third of a penny.

2070. But that would only save two-thirds of a penny upon a pound out of 1s. 6d.?—Although the people who use that butter can afford to pay for it, nevertheless, this small reduction is of some importance. I am referring to this particular traffic, however, more as an illustration of the effect of high parcel rates upon the smaller agriculturists.

2071. Do you think much more would be sold at 1s. 5½d. per pound instead of 1s. 6d.?—I think so.

2072. (*Mr. Glyn.*) In fact it does not come in large quantities?—It comes in small quantities, which in the aggregate, make a great deal; it is a gradually growing trade.

2073. Have the dealers ever tried to make a contract with the company for the conveyance of it based upon quantity?—It would be no use making a special contract for sending a large quantity, because that kind of trade branches out, and you cannot tell what the quantity you may want at one period, and what it may be at the next period.

2074. (*Mr. Horsfall.*) Have you heard any complaints in Ireland as to the unequal rate of charges between town and town?—Yes; as an instance I may mention the case of the mining company of Ireland. We have only one smelting works in the whole country, namely, the smelting works for lead and silver near Dublin. Considerable quantities of sheet and pipe lead, shot and red lead are made there. The margin for profit must be very narrow, considering that we have to import the coal, and have to pay for labour, labour being dearer in Ireland than it is in England, although, and indeed because, the wages are so much lower. The rate from Dublin to Newry by rail is 15s. per ton for lead, and the rate to Belfast is 12s. by rail. It is cheaper to send it the whole of the way to Belfast than to the intermediate station of Newry.

2075. What is the mileage to Newry?—It is very nearly 70 miles to Newry, and 113 miles to Belfast.

2076. (*Mr. Glyn.*) Is that inequality caused by the competition of the railways?—There are three lines in that distance. It is carried 113 miles for 12s., and by steamer for 10s. 1d., and it is carried to Newry which is not quite 70 miles, by rail, for 15s.

2077. (*Earl Donoughmore.*) Are there steamers between Dublin and Newry?—None.

2078. There are between Dublin and Belfast?—Yes.

2079. (*Mr. Glyn.*) Then the competition of the sea rules that?—Precisely. The result is, that the whole of the district which derives its supplies of lead and other articles from Newry by the inland lines branching from it, is shut out entirely from our only smelting works. That difference has been quite enough to drive the Dublin manufacturers out of the market, so close is the trade in these three articles.

2080. (*Mr. Horsfall.*) Do you think that the rate of 12s. to Belfast pays the company?—I think it ought to do so. That question depends much upon the total amount of their trade. If the amount of the trade was as much as it ought to be between those important places I have no doubt it would pay them very well.

2081. Can you give any idea what the extent of that trade is?—It must be very considerable. I can give the ordinary returns. It is composed of three lines. We have first the Dublin and Drogheda, then the Dublin and Belfast Junction which commences at Drogheda and goes down to Portadown, and then there is the Ulster line which goes on from Portadown to Belfast. The Dublin and Drogheda Company's total income per mile was 1,125l. for 1863, which is the only year for which I have the return at hand. The income of the Dublin and Belfast Junction was 1,128l., so that the trade is practically the same upon more than two-thirds of the whole distance. The income of the Ulster line was 1,035l. per mile.

2082. (*Earl Donoughmore.*) Those figures do not give an accurate estimate of the trade between Dublin and Belfast, because both the Drogheda Company and the Ulster Company have other lines which do not form part of the main lines?—No, they do not; but there is a compensation in this way, that upon each separate division of the line there are other lines entering which feed the main line. For instance, the Drogheda line is fed by the line to Navan passing through a portion of the rich grazing grounds of Meath. There is also a direct line from this district into Dublin. Then the Dundalk line gets a good deal of the inland portion of the Ulster trade over it, and the upper part of the line gets a portion of the Armagh and Tyrone trade, so that each of them has a feeder of its own. The return for each division of the line is nearly practically the same per mile, and a great deal of that trade actually comes down to Dublin.

2083. (*Mr. Horsfall.*) Are you aware of any complaints of unequal rates upon any line where there is not a sea competition?—Yes; on the line between Cork and Limerick; for instance, from Bruree to Limerick butter costs 9d. per firkin, and to Cork, which is about double the distance, only 5d. I have an instance upon the same line with regard to the carriage of turf and coal. One truck with 5 tons of coal costs 17s. 1d. from Cork to Bruree, and a single ton 6s. 3d., and it costs nearly as much from Limerick. For turf brought from the Rathmore station on the Killarney line to Bruree, about the same distance as from Cork, they charge 11. 7s. 6d. for a box, which would be about 3 tons weight of turf; and as 3 tons of turf is not more than the equivalent for heating purposes of 24 cwt. of coal, it is a perfect prohibition of that important source of industry.

2084. (*Mr. Horsfall.*) Do you think if there was an increased traffic in coal that it would at all supercede the trade in turf?—The coal trade of Ireland is one source that I would look to for an increase in the traffic. In 1825 the coal trade was about 750,000 tons, and in 1835 it was over one million tons. It is now fully double that, yet, it has only effected an entrance as it were upon the margin of Ireland. I have no doubt it will be four or five millions of tons before many years.

2085. (*Earl Donoughmore.*) Do you think that that will have the effect of very materially increasing the consumption of turf?—I do not think so. I think

Mr.
W. K. Sullivan.
12th May 1865

Mr.
W. K. Sullivan.
12th May 1865.

the consumption of turf will increase, but its price will gradually rise. Unless there are some other means of cutting it than those in use at present, it will be only able to supply the places around the bogs. In the south of Ireland turbary is gradually decreasing in quantity. Wherever the upper part of the deep bogs has been cut away, it is reclaimed and used as grass land, which is more valuable than to cut it down to the marl, especially where it is of a large extent. Where coal is dear, then, of course, turf pays for cutting. A ton of turf averages from 90 cubic feet to 250, that is as stacked for sale; it will be easily understood, therefore, that it is not likely in its raw state to be sent in any large quantities. Coal which can be brought in a concentrated form at a cheap rate as compared with turf, will supercede it, except upon the immediate margins of the bogs.

2086. (*Capt. Galton.*) What is the size of a ton of turf as compared with a ton of coals?—It would vary from three to six times.

2087. That is, one ton of turf would occupy the space of six tons of coal?—Yes, that is the extreme.

2088. A railway waggon would not carry more than one ton of turf?—Not more perhaps of the light, which practically would never be carried. Turf cut from the upper portions of a deep bog and air dried in the usual way, would have a specific gravity of 0·4 or 0·6, and towards the bottom of the same bog it would be from 0·8 to 0·9. Some of bottom turf may even have a greater specific gravity than water.

2089. (*Lord Stanley.*) Have all the attempts which have been made at various times to compress it so as to make it easily portable been perfectly unsuccessful?—They have been perfectly unsuccessful in producing an article capable of competing with coal for general purposes, because the cost of pressure is so enormous.

2090. (*Chairman.*) Can you name any other description of traffic which you think would be developed in Ireland by low fares?—I would say generally that there might be a large traffic in most articles of agricultural produce. More cattle, for example, would be sent upon the railways than now. On the Bandon line no cattle are now carried; they are all walked from Bandon to Cork.

2091. (*Capt. Galton.*) Have they ever been carried on that line?—They have to some small extent.

2092. Is the fare higher now than it was then?—Much higher.

2093. (*Mr. Glyn.*) What distance is that?—Twenty miles. In the neighbourhood of Dublin, which is of course the great centre of the cattle traffic, being close to the English market, nearly all the cattle are walked to market. The Honourable Mr. Massey, who grazes a large number of cattle, says that he buys a great many cattle in Tipperary and distant fairs, and he finds that he can always drive them by road for half what it would cost him to send them by rail. At the last fair of Ballinasloe he found that it was better to send the cattle by boat to Dublin, although there is a railway station on the line to Dublin a quarter of a mile from the town. A person who is most largely connected with the cattle trade of Dublin has given me the following information, which I am also able to substantiate myself. That "In October 1863 the Midland and Great Western Railway Company raised their cattle rates at all the intermediate stations between Ballinasloe and Dublin. The following May the number of cattle and sheep conveyed, as compared with May 1863, fell off considerably, and in October 1864 the great proportion of the store cattle were walked home. Within the last two years the cattle traffic of the Grand Canal has risen from a mere nothing to from ten to twelve boat loads of live stock weekly." That bears out what Mr. Massey stated with regard to the last Ballinasloe fair. One of the chief objections urged by owners of cattle against the management of the cattle traffic of the Great Southern and Western, which, upon the whole, being a very long line of railway, is well conducted,

is, that the drover who has to go with a whole waggon is charged half a fare with the carriage of the cattle, and will have to pay third-class fare upon his return. In addition to that, they make a distinction at certain stations between half a waggon and a whole waggon. A whole waggon is supposed to hold eight beasts, and they allow three for half a waggon; but if the drover puts four into it they charge him the price of a whole waggon. I would like to mention here another instance of the effect of high fares connected with the herring fishery in the neighbourhood of Dublin, which has grown to be a most important trade. The poor persons engaged in the local trade walk from Dublin to Howth, a distance of nine miles, because the cost of a third-class ticket would be often as much as their profit for a day. The consequence is, that any traffic which would be derived from that source is lost.

2094. (*Capt. Galton.*) What is the rate of a third-class ticket?—The usual fares per mile on the Irish railways are, first-class, 2d., second-class 1½d., and the third-class 1d. for a single ticket. A third-class ticket to Howth costs 8d.

2095. (*Mr. Glyn.*) A half fare would help them very much indeed?—I have asked several of them, and they have told me that a return ticket, at a half fare, would enable them to travel by it.

2096. (*Mr. Hamilton.*) Are you aware that in the neighbourhood of the metropolis the fares are much less than half the fares by the trains carrying the working classes being something less than one farthing per mile?—I believe so.

2097. (*Mr. Horsfall.*) With reference to a question that was put to you, as to the new lines which have been made in Ireland, there are some as we know which have been nonpaying lines; do you consider, putting those out of view, that for the traffic upon the substantial lines the receipts have decreased?—I think not. Although I have stated that there has been a gradual diminution according to the mileage returns, I am rather hopeful about the future.

2098. (*Mr. Glyn.*) Has not that reduction arisen chiefly from the opening of branches which have not yet developed their resources?—No doubt that is the chief cause; but of course there has been a considerable depression owing to two or three bad years; in fact, the country is in a transition state.

2099. You stated that there was a considerable cattle traffic as between Navan and Dublin?—Yes; Dublin is the chief port for cattle. A great deal goes by Drogheda direct. There is a line of steamers from Drogheda direct.

2100. Are they carrying cattle at lower rates upon that line than upon the rest of the Irish railways?—I cannot answer that question, for the simple reason that I did not apply to that line for their traffic rates, because they do not print traffic rates, and you have to copy them off boards kept in the office. The traffic rates are very liable to vary.

2101. I understood you to say that the cattle traffic had developed itself?—No, they walk all to Dublin now.

2102. You stated some time back that in making the aggregate receipts for one of the northern Irish railways the cattle trade to Belfast formed a very considerable item?—Or, rather, the cattle trade to four ports upon the whole line from Belfast to Dublin, namely, the cattle trade to Belfast, the cattle trade to Newry, the cattle trade to Dundalk, and the cattle trade to Dublin.

2103. Have the rates for cattle upon the railways connected with those towns been at all diminished?—No; in the case of one of the lines feeding Dublin they have actually raised the rates.

2104. In spite of those rates they continue to send them that way?—Yes; but from places 20 or 30 miles off, where the cattle are sent to be finished, they walk them to Dublin, which is a very great disadvantage to the cattle.

2105. Even for long distances?—Even for long distances, and fat cattle especially.

2106. (*Chairman.*) It must require a very low fare, must it not, to enable the store cattle to be carried on the railways?—Certainly, considering the fluctuations in the price of store cattle, the margin left for profit when they are fattened is very small, and to be profitable they ought to be carried at a very low rate.

2107. Has any scheme ever occurred to your mind by which the experiment of low fares can be fairly tried in Ireland?—Beyond that of an amalgamation of lines, I would rather not make any statement as to what would be the best mode of doing it; but I should say that one first step should be to amalgamate the lines, because I do not think that anything can be done unless the whole of the lines are placed under one central management.

2108. Do you see any prospect of that being the opinion of the directors generally, and that they would be willing to concur in an Act amalgamating all the railway companies in Ireland?—I could not say what would be the individual opinion of the directors, but I know that there is a general feeling in Ireland that such a plan would be very advantageous. I do not think the boards of directors would throw any difficulty in the way; that is, always taking into account that the arrangement left them at least in as good a position, financially, as at present, or that it was advantageous to the shareholders.

2109. Supposing the lines to be amalgamated, have you any reason to suppose that they would be willing to try the effect of low fares?—That is a question which I would rather not venture to suggest. If I were a director myself I certainly would venture upon it.

2110. (*Mr. Horsfall.*) Would the amalgamation do any good unless they did agree on a reduction of fares?—It would do good in this way, if in no other; it would enable rates to be made which would suit particular localities; it would make the rates uniform, and enable branches to be made at a trifling expense, because all the railways would concur to have what I think is most important, namely, wharfs established at the different ports. It would also diminish the actual expenditure. These would be the substantial benefits of amalgamation. Supposing the fares were not reduced, there would be still substantial benefits, which could not fail to be effective of much good in the country. I venture to think that it is only when the lines would be amalgamated that the boards of directors would begin to see what they find in other countries, that it is their business to develop the resources of a locality. They have the monopoly of the carriage, and every town or district in which they create a traffic, will ultimately improve their condition.

2111. Would it not be the fact that if the expenditure were diminished, and the rates not lowered, that it would benefit the railway companies?—I should certainly be in favour of lowering the rates, but I only answered a portion of the question, that there would be substantial benefits, even to the country, from an amalgamation by a uniformity of rates, and by the removal of the anomalies which now exist, by the facilities of coal wharves and other matters, even supposing there was no substantial diminution of rates. I was going to add that it appears to me that the same principle ought to be applied to railway traffic which is actually applied to the valuation of land in Ireland through the country, and that is, the further you are from the market the lower the valuation must necessarily be.

2112. (*Captain Galton.*) How do you apply the principle of the value of the land to railways?—I mean the valuation for fiscal purposes, which after all regulates the actual market value of land to a great extent, is in this way—first, you have the actual intrinsic value of the land.

2113. But how would you apply that to railways; do you mean that as far as the railway is from the market so would you diminish the rates?—I would do it exactly in the same way as is practised in Belgium with so much success, and which, with the permission of the Commission, I will add to my answer. The

principle has also been tried in France upon two or three of the French lines. In the report recently published by the Railway Commission appointed by the French Government to take into account the whole circumstances of the French railways in 1863, it is stated that this reduction was made by the companies of their own will. It is a differential rate of the kind which I suggest. They have applied it chiefly to ores and other metals. The French commissioners hope that this principle will be adopted generally.

2114. That is a uniform rate of charge?—No; a differential rate according to distance (*a paper was here handed in, which is printed as Appendix A. E.*)

2115. (*Chairman.*) Are you prepared to recommend any change in the Irish railway system generally, such as the amalgamation of all the lines into one great company?—I should say that that is rather a question for the Legislature. I am quite satisfied that in Ireland there is a disposition to have one regular system adopted for the whole country with uniform rates, in the regulation of which the resources of the country would be studied. That was also the opinion put forward in all the reports made on the subject of the establishment of railways in Ireland. In the debate upon Irish railways, after the second report was presented, the late Earl of Carlisle, then Lord Morpeth, proposed to make one great line, and to raise a large sum of money by guarantees obtained for it, and the fact is mentioned by him in his speech that several meetings were held in the towns in favour of the system which we now find would be beneficial; and in the Report of the Railway Commissioners nearly all the advantages which I have imperfectly pointed out are referred to.

2116. (*Mr. Glyn.*) Did they not rather propose to divide the country into districts and not into one central management?—Yes; that was one of the propositions, but that would come more or less to the same thing.

2117. Do you think the whole of Ireland could be managed by one central board?—I think it could.

2118. Do you not think, looking to the separate interests which are at stake, that it could be more easily managed by dividing it into three great districts?—Unless those three different boards could have some intimate relations with each other, and the means of settling their disputes, I am afraid they would be a very great disadvantage.

2119. Suppose there is that legislative power of some sort given?—It is a matter which I can scarcely venture at the present moment to give any fixed opinion upon.

2120. What reduction would you propose in the present rate upon the coal traffic as necessarily to bring about its development in Ireland; take a given rate and say what the reduction ought to be?—Taking 30 or 40 miles the cost of a ton of coal would be from 3s. 6d. to 4s. for that distance. To this you have to add about 1s. 9d. which is what it costs the Great Southern and Western to carry their coal to the railway depôts. If they were to have a wharf, and reduce the 1s. 9d. to 6d., and the railway carriage to half the present rate, it would make a very substantial difference to the manufacturer. It would make a serious difference to him to be able to save 3s. per ton in the cost of his fuel. I think it should be at least a reduction of one half of the present charge, in order to make a very substantial inducement to anyone who would be disposed to attempt manufactures.

2121. (*Chairman.*) Have you ever thought that the growth of flax might be stimulated by low rates for carriage?—Undoubtedly, especially in the whole of the Midland districts. One of the great disadvantages under which the attempt to cultivate flax has laboured has been the getting up of scutch mills; scutch mills cost a considerable sum of money, and unless they are fed throughout the year and very carefully worked they do not produce a very large profit; a great number of persons are indisposed to erect those in consequence of the high rates of the railways. They may

Mr.
W. K. Sullivan.
12th May 1865.

Mr.
W. K. Sullivan.
12th May 1865.

grow flax, but the mills may be completely idle, and the consequence is that in the remote districts of Ireland if they do grow flax it is left on the hands of the small farmer and he cannot sell it; if he attempts to send it unscutched of course the bulk is considerable and the rate which he would have to pay would swallow up the entire of his profit if he has to send it for any considerable distance inland. If the rates were very low, that is, if they had that differential tariff which I have spoken of for certain articles, there can be no doubt it would be very advantageous and have the effect of concentrating scutching mills. There would be greater facilities for sending the flax by rail to one central station, and there would be a larger profit realized by it.

2122. (*Mr. Glyn.*) Would not the flax be injured in its transit?—Not when it is steeped and dried; I assume that that should be done by the farmer. When once the straw is dried it can be sent by the rail. Of course the green flax could not be sent.

2123. (*Mr. Gower.*) Have you ever considered what effect the amalgamation of all the railways into one company would have on the future extension of the railway system of Ireland?—It would be beneficial if there were any railways to be made; it would obviate the enormous expenses which are now attendant upon obtaining Bills, because it would remove the opposition to them which now exists, and it would take away the chance of making lines competing against each other and carrying them through districts which do not require them.

2124. Then no new lines would be made competing with the existing lines?—Certainly not, under those circumstances.

2125. Do you think there would be as many lines made in consequence?—I think on the whole there would. I do not think it is always an advantage to the whole country to have lines made through districts competing with others. I do not think it is an advantage to carry two lines through the same district. It may be to the persons immediately concerned for the moment, but ultimately it must be injurious if neither of the lines pay.

2126. Would it not be a great advantage to the districts through which such lines might be taken?—If you have two lines competing for a certain time they will ultimately amalgamate, or one purchase up the rights of the other. We have a very good instance of that in the case of the Grand Canal and the Great Southern and Western Railway. The Grand Canal, which has a separate board of directors, is unconnected in fact with the Great Southern and Western; but its rates of carriage per ton are exactly those of the railway, even for substances like brick and coal. They have had a fight for a long time, and then they have come together and made arrangements by which they created a monopoly. It is a curious fact that it costs just as much to carry a ton of iron ore by

railway, or a ton of anything, from Carrick-on-Shannon as it did in 1835 by that canal. I got the rates at which they carried goods upon the Grand Canal, and I find that practically they are, in several instances, the same rates.

2127. (*Capt. Galton.*) The rates are the same upon the Grand Canal now as they were in 1835?—For most of the distances there is very little difference. They are lower in parts, but taken as a whole they come to substantially the same thing.

2128. (*Chairman.*) Are there any other points which you wish to direct the attention of the Committee to in connexion with Irish railways?—I intended especially to have drawn attention to the undue proportion which the cost of carriage of the agricultural produce of our poorer lands bears to its value. Considering that Irish agriculture has now to compete with the entire world, and that we are transferring part of our population from the poor lands of Ireland to the richer ones of Illinois and other portions of America, that, in fact, in the case of a large number of poor farms, the rates of carriage to the markets amount to nearly the rent in some cases, any substantial reduction of fares on the lines, especially with differential rates such as I have alluded to, would be one of the greatest advantages which could possibly be bestowed upon Irish agriculture.

2129. (*Earl Donoughmore.*) Are you aware that it costs less money to transport a fat bullock from Normandy to London than it does from the pastures of Limerick to London?—Precisely. A friend of mine was actually disposed to go to Holland and buy store cattle and take them to Galway to fatten, and he expected a very considerable profit upon them.

2130. I presume you have heard of Mr. Pollock, the great agriculturist?—Yes.

2131. Are you aware that he has very large farms in the neighbourhood of Ballinasloe?—Yes.

2132. Did you ever hear that he was in negotiation with the Midland Railway Company about special rates for the carriage of his cattle to Dublin?—I heard that he and others were negotiating for that purpose.

2133. Did you hear that Mr. Pollock, not being satisfied with the terms which the railway company were inclined to give him, actually went to the expense of hiring land at different distances along the road to Dublin, so that he might be able to drive his cattle?—Yes, that is one of the points which I intended to draw attention to. Mr. Pollock would not send the cattle at all, but drove them along the road, stopping at night on the different plots of land that he had hired. He preferred walking the cattle to paying the rates which were demanded by the railway company. Some of the directors of the Midland line do actually walk their own store cattle alongside the line.

Mr. R. Mallet.

MR. ROBERT MALLET called in and examined.

2134. (*Chairman.*) Are you a member of the Institution of Civil Engineers, London?—Yes.

2135. And a fellow of several of the scientific societies?—Yes.

2136. And I believe you are President of the Institution of Civil Engineers of Ireland at the present time?—I am.

2137. Have you been long resident in Ireland?—I have. I have not been resident in Ireland for the last six or seven years; but previous to that I resided the greater part of my life there. I may mention that between 1836 and 1856 the engineering firm to which I belong, consisting of my father and myself, (either I as a civil engineer, or our house, as mechanical engineers,) were concerned with almost every public or other large work being carried on in Ireland during that period; and I therefore became familiar with almost every part of the country from one end to the other.

2138. Do you include railways amongst those works?—We executed large quantities of works for the Irish railways.

2139. You are well acquainted with the industrial elements of Ireland generally?—I think I am. We employed several hundred hands for many years in Ireland.

2140. Of course you are of opinion that railways are of great importance to any country: but are you inclined to think that there are reasons which make railways of more importance to Ireland than to almost any other part of the British dominions?—I think there are. It is obvious to those who know anything of Ireland, that its trade is almost wholly confined either to domestic wants, or to export and import trade with other portions of the British Empire. Its outgoing trade is altogether from the east side, the west side which faces the Atlantic is almost a blank. For the produce which goes east it is all important that

it should have a ready means of transport across the land, in fact, the main of the export trade goes across the land in greater or less degree before it reaches the seaports, from whence it is exported. That is one reason. But there is another reason, that refers to its domestic trade. To contrast England with Ireland for a moment, taking for example the Black Country, the coal owners send their coal from perhaps half a mile to a mile to blast furnaces where the pig iron is made; and the sale of the pig iron takes place within a quarter of a mile of the man who puddles it and rolls it into bars. And then again the bars or plates are sold in Birmingham and the neighbourhood. The whole manufacture and trade goes on within a narrow circle up to the point of reaching the consumer. The products of Ireland being mainly agricultural, (although there ought to be a large amount of mineral products which are as yet imperfectly developed,) would have to traverse a much larger space before they would reach the consumer, or any market in which they could be made available. Besides that, they are products very bulky and of small relative value, upon which, therefore, transport bears more heavily than upon a vast proportion of the manufactured products of England and Scotland.

2141. Will you state your views as to the importance of coal being carried upon Irish railways upon low terms?—It may seem at first sight that in a country provided with such a superabundance of peat as Ireland, and with labour presumably at a low figure, coal would be a matter of comparative indifference, inasmuch as peat would be a substitute for it. I have found, however, from experiments conducted in past years on a large scale in Ireland, that the peat even on the bog close to where it is collected, stands at the same value as coal, taking heating power and cost into account, viz. 14s. per ton. That was before the Irish famine, when wages were greatly lower than they are now in Ireland. At the present moment the relative value of peat fuel to coal is probably about 17s. per ton.

2142. (*Earl Donoughmore.*) That is to say that if you could bring coal at 17s. per ton it would be more advantageous to use imported coals than to use peat?—It would. In point of heating power they would be alike; but in actual use at 17s. per ton, coal would be the cheaper, because the labour expended in bandling, required for using peat as fuel, is enormous. It burns so fast that the reduction of heating power due to almost constantly keeping open the furnace door, to keep up the fire, is considerable, so that this and the amount of labour required form serious elements to the disadvantage of the peat itself.

2143. (*Chairman.*) That is using the peat as fuel for manufacturing purposes, and not for domestic purposes?—Yes; this comparison as to the value of coal and peat, has been derived from long experience in great mills.

2144. (*Capt. Galton.*) Do they use peat on railways?—Peat has been attempted to be used on railways, but in its best state it is scarcely available for locomotive engines at all. It so light that it is either blown up right through the tube in broken particles, or goes off in dust. In the compressed state it may be used in locomotives, but not with advantage. Mr. Vignoles and myself were joint patentees in Prussia for a mode of carbonizing peat by the aid of superheated steam. We expected to have done great things with it upon the Prussian Railways, but we found it was an utter failure. The carbonized peat, although pretty hard, had the fault of breaking up into small fragments as soon as it was heated.

2145. How much peat can a man cut in a day?—That will depend very much upon the nature of the bog. The best way in which peat fuel can be procured is to follow the course employed exclusively in the grand duchy of Oldenburg, and in Northern Holland, where peat bog is found in great abundance; namely, not to cut the peat at all, but to take it out in the state of mud, and make it into what they call in Ireland "hand turf," and then let it dry. You thus

break up the natural fibres, which greatly facilitates the evaporation of the water. The peat dried in the best manner upon the surface of the bog contains about 25 per cent. of water, and you must burn as much of the fuel as will evaporate its weight of water before the remainder of the peat can be available. When I say 25 per cent., that is the very best which can be procured; in turf made in unfavourable weather, there is often from 30 to 50 per cent. of water. I consider the existence of peat in Ireland is a positive disadvantage to the country, and I believe the best use that can be made of a large portion of the Irish bogs is to burn up a certain depth from the surface, after drainage, and reclaim them, and turn them into agricultural land. Cutting peat is a sort of work very injurious to the habits of the people, because the season that is occupied in cutting the peat is the spring of the year, when the dry weather is precious to the husbandman, and ought to be employed in labouring in the fields. It is at best a sort of idle gossiping work. Men and women engaged in cutting the turfs, spreading them, and turning them over, are really only half employed.

2145a. (*Lord Donoughmore.*) Is it possible to burn the surface of bog to any depth?—Yes. I have ascertained that it is by previous draining, conducted in a proper manner, in ordinarily favourable summers. Where the drainage is deep enough, and the egress for the water secured below the level of the bottom of the drains, the peat dries and contracts amazingly, and can then be burnt to some feet in depth without difficulty. Thus a large portion of the grand canal was executed through bog, merely by draining and letting the original surface subside. This method of treatment, however, is only applicable in certain cases, burning the bogs universally would be a highly wasteful mode of reclamation.

2146. (*Chairman.*) Ireland possesses a large amount of water power, which is not at the present moment made use of, does it not?—The water power of Ireland is more restricted in its area than is generally supposed. There is a large portion of the middle region of Ireland in which, although there is a great deal of water, there are very few mill sites. The character of the streams is such that natural sites for mills often do not exist, but over almost every portion of Ireland, the character of the streams and land are such as to present facilities for the artificial production at very small cost of mill sites by the impounding of the water. The result of operations of that sort, which have been conducted both in this country and in Ireland, is to shew that for every 500*l.* expended in impounding water in reservoirs, you may impound about 1,000,000 cubic feet. It can be shown that horse-power can be obtained in that way nearly as cheap as you can put down a steam engine, assuming the cost of coal to be 1s. per day, of 12 hours, per actual horse power, which is the average at the price of 17s. per ton.

2147. (*Earl Donoughmore.*) Would not the consumption of coal in steam engines be very much according to the construction of the boilers?—I am assuming that the engines are well constructed. In engines of 30 horse power or upwards the consumption ought never to exceed 3lbs. per hour per horse power. Power obtained in the way I have alluded to, viz., impounded water power, however, is always liable to serious disadvantages. It obliges the placing the factory where the water power is found, regardless of the proximity or other relations of markets, whereas the steam engine gives us free choice as to the place to locate a manufacture. I come back to this, therefore, that it is all important to get coal into Ireland at a far cheaper rate than it has hitherto been got. I believe by proper arrangements at three of the Irish ports, at one in the north, at Dublin, and at one in the south, for the taking of coal from steam colliers direct, and giving the steam colliers a back freight in mineral produce, and with proper arrangements for low freights along the lines of railways, that coals can be supplied over three-fifths of Ireland, and to

Mr. R. Mallet

12th May 1865

Mr. R. Mallet. 2,000,000 of its inhabitants, at a reduction of from 3s. to 4s. per ton, on the present price.

12th May 1865. 2148. Making it what?—Making it from 10s. to perhaps 12s. a ton. I do not think it would in any place exceed 14s. per ton.

2149. (*Chairman.*) At the railway stations?—At the depôts established along the lines of railway. At those depôts proper arrangements could be made by which the coal could slide at once into carts, free from breakage or needless labour in handling, and be taken direct to the consumers. The great point to be kept in view is, that there should not be any unnecessary handling of the coal.

2150. (*Mr. Glyn.*) In point of fact using the same appliances that they do in England for that purpose?—Yes.

2151. (*Mr. Hamilton.*) What is the price of coal at the port of delivery, take Dublin?—The price of coal in Dublin now varies from 14s. or 15s. per ton up to 22s. per ton according to the state of the wind. Sometimes with a contrary wind the colliers cannot enter Dublin, and then I have known the price of coal to rise almost to a famine price.

2152. You mean that it cannot be delivered at the railway station at that price in Dublin?—No, I am speaking of the actual price at the quay at Dublin.

2153. It can be delivered at one railway communicating with another railway at the price that it is now?—At the port, and then you must add the cost of taking it along the railway.

2154. For a distance of 60 miles what would that be?—I am satisfied that coal can be delivered at a profit upon the Irish railways at present at a farthing per ton per mile, provided you get back freight for the train, and a halfpenny per ton per mile if the waggons must come back empty.

2155. Have you calculated the scale at which it will be necessary to carry coal in order to carry it at a profit?—Coal could be carried at a profit at that rate if you only have 100 tons in the train; you might have 1,000 tons if necessary.

2156. You say that coal can be carried at present at a farthing per ton per mile if the locomotive only took 100 tons?—That would be so, provided the run was 100 miles or more.

2157. Are you acquainted with the evidence which was given in the House of Commons last year upon the subject of coal traffic to the north on a new line to come in competition with the Great Northern?—In part; yes.

2158. Are you aware that it was then stated that in order to carry coal at a farthing per ton per mile your gradients must not be worse than one in 400?—All I can say then is that I dissent from that calculation. I am quite sure you are not likely to get from railway companies very impartial evidence on such a point.

2159. This is not evidence given by railway companies. It is evidence given by some of the first engineers of the day, Mr. Fowler, Mr. Hawkshaw, and Mr. Bidder. Do you dissent from that evidence?—I do not believe that the question of gradients would at all enter so largely into that question. I may remark that as far as regards Irish railways the gradients are particularly good the country being very flat.

2160. (*Capt. Galton.*) You think that coal can be carried at a farthing per ton per mile if they get back freight for the trains; and a halfpenny per ton per mile if they go back empty?—Yes. It is a fact that at this moment on many of the lines in England coals are carried at a halfpenny per ton per mile, and actually pay a profit of between 200 and 300 per cent.

2161. (*Chairman.*) The present price exceeds what you think it ought to be delivered for into the interior at present?—Quite so.

2162. What means do you propose to take for lowering the price at Dublin? that does not depend on the Irish railways?—No; but it depends upon bringing the coal in in suitable vessels, and discharging

them in a suitable way. At present the coal comes up to the quay side, and is discharged into bags by hand labour altogether, and is distributed by carts, except a certain quantity which is discharged by hand over the ship's sides into canal barges in the harbour and is transmitted by the two canals which go out of Dublin into the interior.

2163. Is a very large proportion of the cost of coal in Dublin occasioned by the manner in which it is landed in Dublin, and the character of the ships in which it is brought?—There would be a considerable saving by the use of steam colliers and mechanical coal whipping machinery, to take out the coal by mechanical means in place of hard labour, and place it directly into the waggons on the rails.

2164. Are any steam colliers used in the Dublin coal trade at present?—No, not as yet. At this moment there are steam colliers about to be started. I am the author of a project, of which I believe some notice has been taken before this Commission already with a view to making docks in Dublin in connection with the Dublin Trunk Connecting Railway, sanctioned last Session, for the express purpose of carrying out this vast trade in the coal supply of Ireland.

2165. Do you think it practicable that back carriage could be obtained for the coal trucks which would deliver the coal into the interior?—I do.

2166. How is that to be created?—I think that would create itself, if the freights upon railways were diminished to the figures which I have mentioned. It would enable a number of mineral products of small value relatively to their bulk and weight, to be brought into play, which are at present altogether precluded from use or market.

2167. (*Capt. Galton.*) Are you not aware that in England back freights are never adopted, owing to the delay which arises from the coal trucks having to wait before they can be filled; and that upon all the English lines the coal waggons almost invariably return empty?—The fact is as you say, but I do not see that it forms any precedent. It simply arises from want of proper arrangements, and chiefly from the fact that those country stations at which back freight might be obtained are not properly arranged for rapidly filling return waggons; and it is therefore cheaper on the whole to return them empty than to delay them. But it does not follow that if the stations and traffic arrangements are properly managed that would be the case.

2168. (*Mr. Gower.*) Then you think that with proper appliances the coal trucks would not go back empty in England?—Not to the same extent as they do now. I cannot think England is here a parallel case with Ireland. Time is much more money in England than it is in Ireland. It would be of infinitely less importance to retain a train of waggons for an hour or two in Ireland than in England. Very often in England it comes to be a question of obstructing the traffic, and they must send them on in order to get them out of the way.

2169. (*Mr. Glyn.*) The coal trade is so very large in England that waggons are required as fast as they can return for the removal of coal?—Very likely. That would be a question of having sufficient plant.

2170. (*Capt. Galton.*) It is also a question of outlay of capital to a large extent, is it not?—Yes.

2171. (*Chairman.*) And is there not involved an increased quantity of sidings for the waggons to stand upon?—All these points are of course involved, additional plant, and all that follows from that. Of course you cannot develop a new trade without having the necessary means of doing it.

2172. (*Mr. Horsfall.*) You stated that coal is at present delivered in Dublin at 14s., what would be the additional cost of taking it 60 miles inland?—You must add 60 farthings, or fifteen pence per ton, to whatever may be the price landed at the port and put into the waggons.

2173. Do you give it as your opinion as an engineer that, without reference to the gradients, they can

carry coals at a profit at one farthing per ton per mile, provided they got back freights?—I think there is no railway in Ireland, the physical features of which would sensibly alter the cost of the transport of coal.

2174. Do you know what the gradients are?—Yes, I do. I think you will find very few gradients upon the Irish railways steeper than 1 in 60, and those which are steeper are very rare indeed.

2175. (*Mr. Glyn.*) Is the return carriage also to come to a farthing per ton per mile?—I think the same rate should prevail for both the forward and the return freight.

2176. Do you take the wear and tear of trucks and everything into your calculation?—Yes.

2177. (*Chairman.*) You have actually gone into the calculation, and have satisfied yourself that coal and other minerals can be carried with a profit at one farthing per ton per mile?—I have. I do not give the calculation at random.

2178. (*Mr. Hamilton.*) Are you aware what the cost of working railways is per ton per mile?—I am.

2179. What is it?—I cannot answer the question in that general form, and I do not think I can answer it at all at this instant.

2180. You are not prepared to give any figures upon the point?—I will supply them. (*See statement at end of evidence.*)

2181. (*Chairman.*) That rate of a farthing per ton per mile applies to trains carrying at least 100 tons, and going at least 100 miles?—Quite so. When I say 100 tons, of course I do not anticipate that the train will be of that size, because they will be more than that size, probably from 300 to 500 tons each.

2182. (*Mr. Glyn.*) You put that as a minimum?—Yes.

2183. (*Chairman.*) With no larger load than that you think it would pay?—I do.

2184. (*Capt. Galton.*) What weight do the railway waggons carry in Ireland?—There are no special coal waggons upon the Irish lines, but the goods waggons carry from 5 to 8 or 10 tons.

2185. The gauge is 5 feet 3 inches, is it not?—Yes. It would be advisable that the waggons upon the Irish lines should carry at least ten tons each; that is, that they should be quite as large, if not larger, than those of the Great Northern.

2186. (*Chairman.*) To what class of manufacturing industry do you conceive that this coal is chiefly to be applied?—It would enable a number of industries to be better developed in Ireland than they have ever been before. I can illustrate that in various directions. For example, there is scarcely such a thing anywhere in Ireland as a good brick, except in the neighbourhood of Belfast, and perhaps on the property of Lord Enniskillen, and one or two other great proprietors. The result of the existence of bad bricks in Ireland for ages, has been that the Irish bricklayers are the worst bricklayers in the British Empire. A mortar joint of nearly an inch thick is thought to be good work in Ireland. The effect again of the want of good bricks or good workmanship puts brick architecture out of use in Ireland. It is owing mainly to that that the Irish towns present some of the meanest architecture in the world. It is owing to that also that in the cottages of the peasantry, stone and mortar partitions are employed at an unnecessary cost, *i.e.*, when the cottages are of masonry and not of mud. Thus the size and comfort of the building is depreciated by it. The clays for brick-making in all the counties in Ireland, with the exception of five, are of very excellent quality for making first-class bricks, but at present a very inferior kind of clay is frequently employed, as the clay is chosen not so much in regard to its goodness as to its proximity to fuel for burning it into brick on the cheapest terms. It results from this often that the bricks have to be carried to an unnecessary distance. Thus, for example, when the Drogheda Railway was in course of execution the bricks were entirely made at Balbriggan, because the coal could be landed there close to the shore and to

the clay-field. The clay there is a highly calcareous clay, and very much too poor in alumina to make good bricks, and so the bricks were of a very inferior quality. I mention that as one illustration.

2187. (*Capt. Galton.*) Would bricks ever become an article of export?—I do not think bricks would be worth exporting. There are plenty of clays and fuel in England for brick-making purposes, and excellent bricks.

2188. (*Chairman.*) That is one purpose to which coals can be applied?—Yes, there are many manufacturing purposes to which they may be applied also, in fact, coal is the obvious basis of all manufactures—coal and power together—power as the means of giving movement, and coal as the means of transmuting matter by change of temperature.

2189. Are there any other manufactures that you have especially looked to as being likely to arise in Ireland with an increased importation of coals?—There are. It has been commonly said that Ireland can never be a manufacturing country, that it has been destined by providence to be merely an agricultural one. That is not true. There are certain classes of manufactures where the proportion of fuel consumed is very great in relation to the manufactured product, which cannot succeed in Ireland; for example it would not be possible to establish crown glass works, where a ton of made glass requires eight tons of coals. It would not be possible to establish copper smelting works in Ireland, because a ton of copper requires about 15 tons of coal; nor would it be possible to make iron in Ireland, where about five tons of coal are required to produce a ton of made iron. But there are a number of manufactures which might and ought to succeed in Ireland where the quantity of coal required is much smaller in relation to the value of the manufactured product.

2190. What manufactures are those you are speaking of now?—I may mention *en passant* in connection with the late brick question, that drain and roofing tiles and other things, as well as coarse pottery and earthenware, such as would suit the wants of the agricultural labourer, might be made with advantage. I will now mention one or two sources of manufacture which might become large ones in Ireland in relation to coal, and in relation to its mineral products also. At this present moment, or at least very recently, for various public works in Ireland hydraulic lime was brought from Halkin Head, from Aberthaw, &c. There exist in the middle limestone of Ireland, in what is called in Ireland the calp series, large numbers of beds of limestone quite of the same character as the Aberthaw. That was ascertained by an elaborate train of experiments by a member of the Board of Public Works in Ireland several years ago. A very large trade in that Irish hydraulic lime might be developed by lower freights. Artificial cements having all and more than the qualities of hydraulic limes, and of the nature of the Portland cement which is made here, might become a manufacture in Ireland. The Antrim chalk, in some places, consists naturally of a chemical compound of siliceous and lime, and such siliceous chalk burnt and ground, with the addition of colourless clay, in fact, if the process which is employed for obtaining Portland cement here were employed upon the materials naturally existing there, a large trade might be made in a very superior cement equal to the English Portland cement in setting quality, and far superior in point of colour, for it might be made perfectly white. Pottery and earthenware works might be developed in Ireland with profit and advantage. I have been informed by Messrs. Kerr, of the Worcester Potteries, who are large dealers in earthenware in Ireland, that the loss from the breakage of earthenware sent into the interior of Ireland amounts to something like 1-6th of the value of the article. That loss alone would offer a considerable inducement to the production of earthenware in Ireland. There are some of the very finest porcelain clays existing in Ireland. I discovered myself a porcelain clay at Howth

Mr. R. Mallat.

12th May 1866.

Mr. R. Mallet.
12th May 1865.

not many miles from Dublin, which we use in our works for making crucibles for melting brass and copper, and which has since been so employed by many others. Similar clays to that exist in many parts of Ireland from which earthenware might be made in Ireland, through which not only the habits of the people might be greatly improved, but a certain amount of wealth produced for the country; to do that it is indispensable to have coal at lower prices than they have it now. I have directed my attention, in the evidence I proposed to give, rather more to the question of the actual back freights which could be at this moment obtained, than to the development of new or special works.

2191. Will you give your opinion as to the back freights that could be obtained?—I will just mention a few as an illustration of those materials which exist in Ireland beyond question in sufficient abundance, and which by ready means of communication and lower freights could be brought into play. Sulphur stone or sulphur ore is exported from Ireland. The greater part of it is sent from Wicklow or Arklow. Some years ago it was attempted to export sulphur ore at the time of the Sicilian monopoly from a place called Silvermines in the interior of Tipperary, but it had to be given up on the ground of the expense of transport. The material was undoubtedly valuable, and there was no end to the market which could be obtained for it; but it was not valuable enough to be able to pay the inland freight and sea carriage afterwards. If they could get it transmitted at the low rate of one farthing per ton per mile it would become a valuable commodity. Sulphur-stone is not of the same degree of importance now that it was at the time of the Sicilian monopoly, but still it is a material capable of being made available. At this moment vast quantities of sulphur-stone come from Germany. I had to report upon some very large deposits existing in the neighbourhood of Minden whence large quantities of ore now come to Newcastle. If it can be brought from that district there is, *a fortiori*, no reason why it should not pay to bring it from Ireland.

2192. Is not the German ore richer than the Irish ore?—No; iron pyrites always give the same quantity of sulphur unless mixed with inert material which is not the case with the Irish stone. I do not think the German stone has got any special advantage over the Irish stone, unless it be that the Irish stone contains arsenic, while the German stone is free from it, and produces a vitriol which is free from arsenic. There is a great deal of ironstone in the county of Leitrim and elsewhere in Ireland, and there is also hematite as well as clay ironstone. At a place called Arigna, in Leitrim, there are several beds of ore which are quite as good as the black band, which could be sent at a profit into England and even Scotland if they could reach the coast at a very moderate rate.

2193. (*Capt. Galton.*) At what rate?—I think a farthing per ton per mile would enable them to be brought into market at present.

2194. They would go to Belfast?—They would probably go to Belfast and probably to Newry.

2195. (*Earl Donoughmore.*) The richer district is on the edge of Lough Allan?—Yes.

2196. Is there not a communication to that by means of the Shannon?—Yes, but water communication by means of the Shannon is of no use for the transport of these ores. I do not say it might be of no use in connexion with railways, but then you would have double handling. What is essential is, that there should be railway sidings right into the iron ore quarry, and that the ore as taken out should be put directly into the waggons, and that without a change of waggons or handling a second time it should reach the port of shipment, and then be mechanically put on board. I do not think it is likely that iron will ever be made at Arigna. The quantity of coal there is very limited, and the character of the coal is bad, but the coal that is there

might be made available for roasting ore so as to reduce its bulk and weight, so that in that shape the ore might be transmitted even at a still better rate of profit than it could be in its raw state.

2197. Have you ever known iron attempted to be smelted with turf fuel?—Every attempt to smelt iron with turf fuel has ended in utter failure. It cannot be done. It has been tried by the ablest metallurgists in the world, by the Germans, over and over again, and they have given it up as a failure. After the pig iron has been once obtained every subsequent process can be performed with peat. You can puddle iron with peat; you can roll bars with peat, and do everything with peat except smelt iron; that is not possible, for the fuel is too fragile to "bear the burthen" in the blast furnace.

2198. (*Capt. Galton.*) Why cannot you smelt with it?—You cannot get peat into the condition to, what is technically called, "bear the burthen." In the blast furnace peat crushes under the weight of the iron-stone and flux, and the furnace gets "gobbed," or it so reduces the temperature that you cannot make iron. Hematite exists in large quantities in the county Tyrone, where I may also state that there are enormous deposits of sulphur-stone which have as yet been absolutely untouched. At Sawell mountain, in the county of Londonderry, between Maghera and Newtown Stuart there are beds of iron pyrites of great magnitude and thickness.

2199. (*Chairman.*) Is the hematite of a rich description?—The hematite is not so good as that from Cumberland, but it is very good, and quite as good as a large quantity of the hematite which is smelted in the west of England. I should think it would fetch in the English market, delivered into the ironworks, from 12s. to 15s. per ton. There are also in the south of Ireland, in the county of Cork, beds of brown hematite containing a large quantity of manganese; these are, in fact, iron-ores very rich in manganese. Attempts have been made to get them into the market to form oxide of manganese for bleaching purposes, but without success.

2200. What part of the county of Cork?—They are in the southern part of the county. These ores if smelted would produce iron highly valuable for producing steel, owing to the large quantity of manganese that they contain, I believe these ores would find a ready market in England.

2201. Are they not worked at all at present?—I do not think they are worked at all. They have been attempted to be worked for the oxide of manganese, but without success.

2202. (*Mr. Glyn.*) To what has the want of success been due?—They are in fact relatively poor in manganese; therefore, for the purposes to which oxide of manganese is applied, they are a very bad material, for oxide of manganese, almost chemically pure, is not largely imported. I may illustrate this point of mineral resources further by noticing the fact that on the north west coast of Ireland, in the neighbourhood of Donegal, there is to be found sand of remarkable purity for making glass; in fact, it is so pure that glass made from it is very much better than that made from the Dorsetshire sand or any sand that they are in the habit of using in England. That sand is at present absolutely isolated from use; it would not be worth while to send round to a wild west coast without a harbour, and bring it by ship to any glass manufacturing place. But if that sand could be brought by rail to Newry or Belfast or Dublin and transported across to Lancashire it would be considered a precious commodity in the plate glass works at St. Helens and elsewhere. It would improve a trade which exists to a small extent in Ireland already, namely, the making of wine bottles. Our British wine bottles are a national disgrace to us; they are the ugliest and worst glass bottles in the world, as all know who have seen foreign wine bottles. The French bottles are made from the sand of the Paris basin and other sands of the tertiary formation. This Donegal sand is almost chemically pure siliceous,

and is superior to any foreign sand that I am acquainted with. In the range of mountains north of Newry there exists white granite; it is a very beautiful building stone which of itself might become an article of transport if the rates were lowered. The marbles of Ireland are very various and valuable, but they are almost unwrought. Both the white granite and the white limestone, as building stones, and the marbles, might be sent, if the rates were low, as back freight to Swansea or to Lancashire, where coal is raised and shipped in return. I may also observe lime for agricultural purposes could be greatly reduced in price in Ireland provided there were cheaper modes of transit.

2203. (*Capt. Galton.*) What is the price of the lime?—In Ireland it is from 6d. to 10d. a barrel. A barrel is about five cubic feet.

2204. How many bushels would that be?—It would be about seven or eight bushels. We burnt lime for a considerable length of time for our own works. We burnt it with the "breeze" or refuse coke from our iron foundries, and we could produce lime at the kiln's mouth for about 3½d. per barrel, prime cost. There the fuel I might say cost nothing because it was waste fuel, or that which could not be used for any other purpose. The price of lime I understand at present is as low as 6d. per barrel in some parts of Ireland, at least so I have heard, but I cannot say so from my own knowledge, having been resident out of Ireland for some years; but I know that lime could be bought five or six years ago at 10d. per barrel in various parts of Ireland.

2205. (*Chairman.*) You are not looking to lime as an article of traffic upon the railways, but as an article the cost of which might be greatly reduced by having coals cheaper?—Yes. Turf is most expensive to use for burning lime, it takes about 25 cubic feet of turf to burn a ton of lime. Returning to other mineral products, there are many portions of Ireland from which flagging of very valuable kinds could be obtained if transport were cheaper on railways. At Mountmellick there are sandstone flags of great hardness and good appearance, and they can be got of extreme soundness, but they are almost unknown in the market at present. I know of but one instance of their having been largely used lately, namely, by Mr. Guinness for flooring St. Patrick's Cathedral, Dublin, after its restoration by him. The Yorkshire flags are imported at the present time into all parts of Ireland.

2206. Are there a good many Carlow flags used in Dublin?—Yes; the Carlow quarries might be better developed than they are. At this moment the streets of Dublin are being paved with paving sets obtained from Penmanmaur in Wales, whereas they might have obtained them within 40 miles, in Carlow county, and quite as good, if they had had the intelligence to look after them. There is no doubt with reference to the development of these things that you have got to deal with a country in which the lower classes are absolutely ignorant of even the rudiments of technical education. This is one of the very reasons why I conceive a reduction of the freights upon the Irish railways for passengers as well as minerals, would be of importance. Lord Bacon himself recognised travel as one of the most direct modes of education. I think it would have a decisive effect upon the peasantry of Ireland if they could travel about more freely, and so learn more what their neighbours are doing. It is very rare at present that they ever go 10 miles from the place where they were born.

2207. Has there been any tendency heretofore towards the development of these branches of industry?—There have been desultory attempts at different times, but very slight. Ireland has been unfortunate with regard to its industrial developments from the want of technical knowledge displayed on the part of the promoters of projects. About 15 years ago a company was established in Dublin for making crown glass, and I was requested to become a shareholder. My reply was: When you can show

me that you can make crown glass without using eight tons of coal to a ton of glass I will become a shareholder. No one who had the very rudiments of technical education could honestly attempt making crown glass in Dublin; it is not possible that it could pay.

2208. (*Mr. Ayrton.*) How far are these flag-stones from any railway?—The Carlow flag-stones must be from five to six miles, and those at Mount Mellick must be double that distance if not more, but flag-stones and other mineral produce of an extremely low value in relation to weight will not pay for carting five or six miles, nor even for carting at all.

2209. You want a railway made into the quarry?—What is wanted is a tramway made from the quarry to the railway.

2210. How deep are the flagstones in the strata?—The Mount Mellick stones are found quite near the surface. The quarries are extensive, but of small depth. The Carlow flagstones are found by digging into the side of the hill. Again at Kilrush, on the Lower Shannon, there are flagstones of considerable value, which are employed at Limerick and the immediate neighbourhood; but they are not known anywhere else.

2211. How far are they from the water?—They are but a moderately short distance from the water-side, they are brought up the Shannon and carted from the waterside to Limerick. The latter distance is small. The Valentia slate has been acknowledged as a material of extreme value as a constructive material, but comparatively little use can be made of it from the fact that it is isolated where it is.

2212. (*Chairman.*) Is it a good slate for roofing purposes?—It is not used for roofing at all, it is in slabs, it is not a fissile slate, it does not split.

2213. Do you know of any slate quarries in Ireland which produce slate for roofing purposes?—There are several. I was pleased at the Industrial Exhibition of last year at Dublin to see roofing slates produced from no less than eight localities, some of them were very fair slates. The Killaloe slates are not bad; there are some slates in the county of Wicklow which are very good. But the finest slates in Ireland will be found in Kerry, where the beds have received a greater amount of compression and where the lamination produced by compression has been most perfectly and regularly developed.

2214. (*Earl Donoughmore.*) If you were consulted by any person about to build a large building in any part of Ireland, would you not recommend him to employ Welsh slates in preference to the Killaloe slates?—I certainly should prefer Bangor slates to the Killaloe slates, for this reason, that the latter slates are a good deal the heavier; but that arises partly from the Killaloe quarry not being worked to a sufficient depth. There are thousands of buildings in Ireland which have no better roof than thatch, and although Irish slate may be inferior to Welsh, it would be important to develop the trade in these roofing slates, because it would obviate the necessity of these cottages being covered with thatch, which is at once the worst and dearest of all roofs.

2215. I suppose you will admit that no landlord in Ireland in these days would think of building a new house and thatching it. Would he not roof it with slate of some kind?—Yes. I think even Welsh slate would be found to be a far cheaper roof in Ireland.

2216. (*Mr. Ayrton.*) Are you aware that the Irish tramway Act requires all tramways to be made of the same gauge as the Irish railways?—Yes. I hope to live to see that condition repealed. I think a permissive power to execute railways both for passengers and goods on the narrow gauge would be of importance to many of the poorer districts of Ireland, and many of the districts of the other portions of the kingdom as well.

2217. (*Chairman.*) What do you call the narrow gauge?—I mean a gauge not exceeding three feet.

2218. (*Mr. Ayrton.*) For slate quarries and all their ancillary purposes, you think there should be

Mr. R. Mallet.

12th May 1865.

Mr. R. Mallet. as much freedom with reference to the gauge of the tramways as there is in England?—Quite so; for quarry purposes I should not think that a gauge of about more than perhaps two feet would be desirable.

2219. (*Capt. Galton.*) Would you make such narrow gauge railways in connexion with existing railways through a poor district?—I would make them as feeders.

2220. You would not object to the transshipment that would be necessary?—You cannot avoid that as a necessary consequence of the difference in gauge, but you may mitigate it to the largest extent that mechanical appliances will enable you.

2221. But still the fact of having a narrower gauge for branch lines would necessitate transshipment?—It involves a break of gauge no doubt.

2222. You do not look upon the objection to that as sufficient to prevent your thinking it desirable to adopt it in poor districts?—I do not.

2223. (*Chairman.*) What sort of districts?—I am alluding to Mayo and to the remoter west of Galway. To take one example of the minerals we have been talking of; we have all seen the green serpentine from Connemara. I myself accidentally discovered a serpentine greatly superior to the Connemara serpentine, in a totally different district of the west of Ireland. It is said to be worth 10s. per cubic foot in London, but at present quite unapproachable.

2224. (*Capt. Galton.*) But it is a long way from a railway, is it not?—It is miles from a railway.

2225. Could a branch line be made at a reasonable expense?—There would be no difficulty whatever in making a narrow gauge line; and I conceive that in these large thinly peopled and undeveloped regions, those narrow gauge lines should be made not only as mineral lines, but for passenger lines as feeders for the great lines.

2226. What gauge would you adopt?—I should adopt a gauge not exceeding three feet, and probably less.

2227. Does Mr. Fowler propose anything of that sort?—I do not think Mr. Fowler has. Ten years ago I proposed to form a line on the narrow gauge in the neighbourhood of Dublin, but the project dropped through for reasons which I need not detain you with. Since that I understand that Sir John McNeill has seen the importance of narrow gauge lines; and recently at the institution of civil engineers we had a paper read by Captain Tyler, R.E., giving an account of a Welsh narrow gauge railway which has been made a passenger line. I may also mention that Col. Yool of the Bengal engineers has strongly recommended the Indian Government to adopt as feeders for the great trunk lines a number of small narrow gauge lines. The vast difference in the cost between a railway of 2 feet 9 or 3 feet and of 5 feet 3 inch gauge is not at all apparent at first sight.

2228. (*Chairman.*) How much saving per mile would it be in your opinion so to construct them?—I can best answer that question by saying that I believe in the west of Ireland, or over any portion of Ireland, in fact, narrow gauge lines might be constructed for from 3,000*l.* to 4,000*l.* per mile.

2229. (*Capt. Galton.*) Then in Ireland you consider that the gauge of 5 feet 3 has been one of unnecessary cost?—No, I do not, I think the Irish 5 feet 3 gauge is the very best in the United Kingdom, but I think that that gauge should not be compulsorily employed for every part of the country. All the great trunk communications should be of that gauge for carrying heavy locomotive engines and carriages; but when you have got a smaller traffic, and a traffic of a character which will bear subdivision, and the narrow gauge is suited to it, then I think the narrow gauge would be more advantageous.

2230. Have you considered what the average cost of transshipping from any of these narrow gauge lines to the ordinary gauge would be for minerals?—I have not brought it out into figures, but I have con-

sidered what the cost would be, and I am satisfied that it would be very small with proper mechanical arrangements for changing the mineral produce from the waggons of one gauge to that of the other. For example, the small gauge waggon might go up a higher bank and the larger waggon be put below, and the upper waggon might be made to shoot its contents into the lower waggon.

2231. For flags and marbles the expense would be very much greater?—Flagging would admit also of mechanical means of transferring it from one to the other. For example, on the bottom of each narrow gauge waggon there might be an iron grid on which the flags might be laid, and attached to that there might be four hooks, and by means of an hydraulic lift the whole contents of the waggon might be taken up and dropped into the broad gauge waggon. It might be so arranged that the contents of five or six small waggons might be transferred to one large waggon.

2232. (*Capt. Galton.*) Are you aware that the Great Western railway in fact find very great inconvenience from the difficulty of transshipping, with all the appliances they have got, the coal and ores from the very narrow gauge lines which connect collieries and other works with their own broad gauge line?—It is not found to be the case in Durham and Northumberland where the coal is brought up from the pits in trucks running on narrow tramways. Very frequently the coal is transmitted from these over a screen and passes thence into the large waggons.

2233. It breaks up the coal very much, does it not?—There is a certain breakage, but that depends upon the skill with which the machinery is devised. The coal slips by which, at Cardiff and the Tyne Docks, the coal is caused gently to slide in a continuous stream on board the ships, now scarcely break the coal at all.

2234. Was not the discussion upon the paper read at the Institution of Civil Engineers by Capt. Tyler very adverse to the adoption of the narrow gauge?—I think it was, but there were very few present except myself and one or two others who entered into a discussion of the merits of the narrow gauge at all.

2235. (*Mr. Ayrton.*) After all, each case will depend upon its own particular facts, will it not?—That is true only to this extent, the first element that must fix the gauge for any railway is the amount of traffic and the sort of material to be carried.

2236. And whether it is a hilly country or a flat country?—Quite so. Hilly countries will show themselves most favourable to the narrow gauge.

2237. (*Chairman.*) Do you think that no additional lines are required in Ireland upon the broad gauge?—I think there are some. A general feature of the Irish Railways is that they start like a fan radiating out from Dublin, and there is a great difficulty at present in making your way direct by railway from the north to the south of Ireland, especially in a direction north-east to south-west. If you attempted to send goods from Cork now, and sent them by rail by the shortest connexion of lines along the centre of Ireland, I apprehend they would not reach Londonderry under a fortnight. There have been considerable efforts made of late years to induce the cultivation of flax in the south of Ireland, in order that the flax cultivated there might be sent to the manufacturers of linen in the north. If that were successful (and it has been partially successful so far) it would be important to have the readiest means of transmission between the one and the other, both for those who grow the raw material and those who are concerned in the manufacture. It would be very desirable that the requisite number of links of communication should be formed which would be necessary to unite the northern system and the southern system without those breaks which now exist; but I think it far more important with reference to the extreme west of Ireland, which is not likely to be opened up for a considerable time upon the broad gauge, that it should be laid upon, and connected by means of tramways upon a narrow gauge. More important, however,

than either, is to make the best of the existing system, which is not done.

2238. Have you given much consideration to the cattle trade of Ireland?—I have considered it with reference to improved means for the transport of cattle. At present the cattle suffer very much, both upon the railways and in the boats, between Ireland and England, and improved appliances and improved management are very much wanted.

2239. Are they as well managed in Ireland as in England?—I apprehend there is not very much difference. The sufferings of the cattle are very great in both countries. Of course, upon the score of humanity it would be of no use saying a word; it is merely a question of the value of the meat when it comes to the market. An unfortunate fat ox, or cow, goes up from Tipperary to London, and is kept standing upon a hard plank the whole of the time. The feet of the animal are off the grass, or other comparatively soft and damp substance which he has been standing upon for months, and will not bear the pressure of his great weight resting upon a timber floor, often for days, without intense pain, and the animal suffers very much in consequence, and he loses flesh and value by it. I think the cattle waggons ought to be provided with a stratum of dry peat. I have kept horses myself standing constantly in the stable on peat with great advantage to their feet. The peat might be thrown out of the waggons at the end of one, or after two or three journeys, and would be in itself manure. The droppings of the animals and their urine, which latter is all now lost, would be all mixed with it, and would be rendered comparatively inodorous by the peat, and the hoofs of the animal would be greatly relieved by it. Besides that, there ought to be means by which the cattle could comfortably stand without leaning against one another; there should be bale-bars between every pair, and there should exist the means of supplying them readily with water; there should be sidings in which there might be contrived troughs, by means of which the cattle without being removed from the cattle-vans could drink comfortably and without loss of time. The cattle boats are of an extremely defective description. The cattle are driven on board by blows and violence, and they stand either on the deck or confined in the hold. If the sea is rough in the winter-time, those who are in care of them, as well as the seamen, are sometimes afraid to go near them for fear of being crushed to death, and the cattle suffer very much. I have seen cattle arrive in Liverpool with their horns knocked off, and other injuries of a similar description. I have myself designed a special class of cattle boat which I hope to see employed hereafter in the Irish ports. These are boats of a greater beam, drawing a smaller quantity of water, and designed especially for cattle, sheep, and hogs, in which there would be the means for the cattle walking or board, and walking on to the shore. The cattle would be under deck cover, and their drovers would have the means of obtaining easy access to them through the voyage; the cattle would have the means of lying down, and they would be foddered and watered during the whole voyage, and their manure would be carried off mechanically, so that they should not get covered with it as at present.

2240. (*Earl Donoughmore.*) If those steam boats were specially designed for cattle how would they get back freight from England?—They could carry bale goods of almost every description, and they might even carry passengers.

2241. You think the peculiar adaption of them would not prevent their being used as ordinary steamers?—I think not; they would not answer for certain classes of freight, for instance, it could not be desirable to carry pig-iron in them because that would injure the fittings belonging to the cattle, but manufactured articles coming from England to Ireland might go in them just the same as in the present steamers.

2242. (*Chairman.*) Are you acquainted with the

charges for cattle traffic at present in Ireland?—I am generally acquainted with them.

2243. Are those charges higher than you think they ought to be, so as to be remunerative to the railway companies?—I should not like to give an opinion upon that point. The cattle trade is one that I am not sufficiently acquainted with to be able to do so. I am clear that the fares for all mineral produce ought to be lowered materially; I may also say that the fares for passengers ought to be lowered very considerably.

2244. I believe you have some observations to make as to the connexion between the Dairy Farms in Ireland, and the Railway system?—I may most briefly answer that question by saying that, in the United States the large cities are supplied with milk brought from a very considerable distance by railway trains. The climate of the Northern States is very hot in the summer, and very cold in the winter, which necessitates special precautions by which milk can be brought very long distances by rail. A gentleman of the name of Borden has taken out a patent for concentrating milk to about one-third of its bulk for such journeys; the process is peculiar. There have been many bygone attempts made in France to obtain a sort of portable milk, but none have been successful hitherto, arising from the want of knowledge of the organic chemistry of milk. This plan of Mr. Borden's has been successful; he submits the milk in tall cylindrical cans to a temperature of about 190°, until it arrives at that temperature it is kept constantly stirred by machinery in these cans; the milk at that temperature is withdrawn from the cans by means of suction into a large boiler or cauldron in which by an air pump worked by steam a vacuum can be produced. The air pump is kept going until the aqueous portions of the milk maintained at 190° Fahrenheit are evaporated nearly to two-thirds; at that point the heat is withdrawn and cold water is permitted to pass outside the vessel where the steam for heating it was applied before, so as to cool the milk gradually. The air pump is still kept going simultaneously with the water process; the effect of that is that some peculiar fetid animal ether is withdrawn from the milk which seems the great element by which the fluid becomes putrescent in its natural state. After this has been removed the milk will bear to be transmitted to almost any distance and will remain many days without undergoing any sensible change. New York is supplied with concentrated milk in this form; they mix it there with two-thirds of water and those who use it affirm that the milk so mixed has a richer taste than it had originally.

2245. Do you think that any trade of that kind can spring up in Ireland?—I see no reason why the rich pasture land in the South of Ireland and also that in the North-west should not become sources from which a supply of milk to a large portion of the manufacturing districts in the south and north of England and the west and south of Scotland should be brought. By proper arrangements with the railway companies to provide milk trains, I have no doubt that a supply of milk might be sent from Ireland to England which would cheapen the price of milk in England.

2246. (*Mr. Ayrton.*) Do you know the price of milk in Ireland?—I know some years ago in Dublin, milk was sold at 3d. per quart. It is cheaper now than in England.

2247. (*Earl Donoughmore.*) Do you think it would be worth the while of the dairy farmers, in the South of Ireland, who are now making a very considerable profit, so entirely to change their system of trade as to introduce this system of desiccating milk?—I see no reason why one trade should interfere with the other, I suppose it will be admitted that the production of milk in the South of Ireland might be increased tenfold.

2248. (*Mr. Ayrton.*) Are you acquainted with the relative profits of farming, with reference to selling milk, and making butter, using the butter-milk?—I had better say that I am not; although I had 21 acres of grass in the neighbourhood of Dublin, and I found that if I chose to become a milk farmer, and

Mr. R. Mallet.

12th May 1865.

Mr. R. Mallet. sell the milk, I could have made out of those 21 acres of land a large profit.

12th May 1865. 2249. Do you know whether it is more profitable for a farmer, within 50 miles of London, to make the butter and use the milk afterwards, than to sell the fresh milk?—I should consider it would have been more profitable within 50 miles of London, to have sold the milk than to have made butter of it. A great deal of the best butter which comes to London, comes from Cambridgeshire.

2250. (*Chairman.*) Have you formed any opinion as to the advisability of a temporary state control over Irish railways?—I think a control by the State, if it compelled the experiment to be tried of reducing the fares and freights, would be valuable and likely to be highly advantageous.

2251. Do you contemplate an Act of Parliament compelling the railway companies to reduce their fares very much below the present rate?—I presume some legislative means would be necessary in order to induce them to do so. I do not think they would have the courage to make the experiment themselves without that, and therefore, I think that amount of control would be necessary. I think it would be disadvantageous that the management of the railways should be at all placed in the hands of the state even in Ireland.

2252. You do not see any prospect of the railway companies themselves making the experiment of low fares and charges?—I think not. The management of the Irish railways betrays the utmost want of energy on all sides. They seem to lay on their backs and let the traffic come to them if it will, and if not, it cannot be helped. They have even shewn occasionally the most marvellous impolicy. Thus, where their freights have been falling off, they have actually raised their charges in order to keep up their dividend, and thus have totally destroyed that which was already a declining trade.

2253. Can you state distinctly to what extent you think the control ought to be exercised over the railway companies, and in whose hands that control should be placed?—I think the control should be placed in the hands of a mixed commission, upon which probably there should be some traffic managers and engineers. They should operate under an Act of Parliament. The lowering of the fares to a certain extent should be compulsory, and then the working of the railway boards of Directors should be merely supervised as it were, by such a commission, so as to be assured that they did their best under the existing new system, to develop their traffic, and did not in fact wilfully or perversely interfere with its operation. Beyond that, I do not think much control would be advisable or necessary, but to do that, I apprehend that a guarantee must be given, otherwise legislation would become a sort of spoliation. If these directors think they shall be at a loss for a time, and they would be at a loss no doubt for a time, you must guarantee them against that loss, although you compel them to make it up afterwards.

2254. (*Earl Donoughmore.*) From what source is this guarantee to be derived?—I think it ought to be derived from three sources; from the railway companies themselves, from the country at large, and from the State.

2255. By the country at large, you mean Ireland?—Yes. I think it ought to extend over a given number of years and be divided in something like this sort of way. I may just state here that when the Midland Great Western started they had fourth-class passenger carriages, but they very soon dropped them, and now they have nothing but third-class passenger carriages. The charges for third-class passengers over a large portion of Ireland are such as almost precludes the Irish peasant from travelling on the railway.

2256. (*Capt. Galton.*) Is it not the fact that it was the same charge as used to be charged by Bianconi's cars, a penny per mile?—Yes, the lowest fares are

nearly double what the peasant ought to travel for in the interior.

2257. (*Mr. Ayrton.*) Do I understand you to suggest, that this State administration should be on the basis of making the railway system profitable; that is to say, there should be return enough to pay a fair dividend after payment of all working expenses, or would you leave them unprofitable?—My opinion is, make the experiment, and it will be attended ultimately with a successful result. I think that you will create such an enlarged traffic in the course of eight years that the railway companies will not only be able to pay as large a dividend as they do now, but a great deal more.

2258. (*Capt. Galton.*) It would not be fair that the loss which might arise from such a guarantee should fall upon the country; ought not the railway companies to pay that eventually out of their future earnings?—I think that would be scarcely fair. You call upon them to make a great experiment, which they believe will be a perilous one, and which everyone must admit is an experiment.

2259. I am assuming that they will get larger dividends eventually than they get by their present arrangement?—I think it might be fair that if the dividends at the end of eight years were considerably better than they are now, the railway companies should be called upon to recoup the State and the country (that is, Ireland) from any guarantees which it has had to pay in the interval. I doubt, however, if after three years there would be any guarantee to pay at all. I should propose to divide the guarantee into four periods of two years each, and divide the guarantee between the railway companies and the State in the following ratios. During the first two years, the railways should pay three-ninths of the whole, the country two-ninths, and the State four-ninths. For the next two years I should propose that the railways paid four-ninths, the country two-ninths, and the State three-ninths. For the third two years I should propose the railways still to pay four-ninths, the country three-ninths, and the State two-ninths. For the last two years, or to the end of the eight years, the railways should pay five-ninths, the country four-ninths, and the State none.

2260. (*Mr. Ayrton.*) Do you mean that each county is to pay in respect of the railways in that county, or the whole of Ireland is to pay?—I think the whole surface of Ireland should be rated, but it should be rated upon the same principle that the watershed of a district is determined, that is by taking a dividing line between the railways, and that they should pay in some ratio to their distance from the lines.

2261. Do you mean that Ireland should be divided into certain railway areas?—Yes.

2262. Then that each of those areas should guarantee the lines within that area?—That would be one mode of doing it. I think it would be the fairest mode to have a universal assessment based upon this principle, that all land within 10 miles along the line will be assessed at a certain rate, and land within 20 miles at a certain other rate, and outside that again at a third rate; but that some rate should be universal over the whole country. If the tax came to be levied, and if there was a really serious loss, it might be better borne if spread over the whole country.

2263. Would it be right that a district at a distance from a railway should be taxed to support it?—I think so, because it would really be benefited by the railway in proportion to that distance.

2264. How would that district be benefited which is at a distance, unless the railway was used as a means of sending goods?—Assuming the railway to be in operation, I certainly conceive that those who are nearest the railway are mostly benefited by it; but all are benefited more or less.

2265. Would not that depend upon whether he sent his goods to market?—Clearly, a man might be rated who might say I have no interest in this railway, but I should consider him to have an indirect interest, and therefore he ought to pay as well as others.

2266. (*Earl Donoughmore.*) Take the city of Dublin, which is a seaport town, of course there is no part of the city of Dublin which is not within 10 miles of a railway. You propose, by your scheme, that the inhabitants of Dublin should be taxed upon the highest scale. How are the inhabitants of Dublin interested in this question at all? how is it just or fair to call upon them to pay upon the highest scale, when they have no interest whatever in the question?—I cannot admit that they have no interest in the question; on the contrary, I think that every man in Ireland is most vitally concerned in the attempts to make railways available, because in proportion as they are available so is the country prosperous.

2267. I will take the instance of my Lord Pembroke, who is the proprietor of large estates in the city of Dublin, how would the reduction of fares, which would enable coal to be transported to the centre of Ireland, or which would bring serpentine from Galway or sulphur ores from Wicklow, or stone from Kilkenny, effect the value of Lord Pembroke's property?—I might answer that by saying that they would raise the value of his property if they made Dublin more prosperous. But if the rate were an acreable rate as I propose, it appears to me that it would affect Dublin very little more than the other parts of the country.

2268. Then your proposition is that it should be an acreable rate, and not a rate upon the value?—I think so.

2269. So that an acre of poor mountain land, similar to that on the top of the Galtee mountains, would have to pay as much as an acre of rich pasture land?—No, because those mountain lands would be situated a great distance from the railway.

2270. (*Mr. Ayrton.*) Is it not the case that along the Galtee mountains there is a good deal of stony land?—There is some.

2271. Would it be right that this stony land, because it was within the narrow zone, should pay in a greater ratio than the rich fertile land which happens to be in the distant zone, and which would therefore produce probably three or four times as much agricultural value?—It should not only be a rate upon the acre, but the value should be taken as an element. I do not at all pretend to go into the details of how such a tax should be levied, or what might be the exact best mode of assessment. I think it is obvious that the country would be benefited by such a system, and I think it is therefore fair that the country should be called upon to pay its quota towards the risk or expense, and so in some way you must tax it.

2272. Is not the value of the land in Ireland regulated by its distance from ports and large towns?—That is one element.

2273. If you are to carry produce into the country at a loss, and tax the community for that loss, are you not in fact subsidising persons who have less valuable land at the expense of those who have the more valuable land?—I have no doubt that for a time, and in so far as the guarantee would become operative at all, that a certain amount of such apparent injustice would be done; it would be scarcely possible to do it otherwise, but I apprehend that the guarantee itself would melt into an exceedingly small sum when it came to be put into money value. I calculate that the loss could under no possible circumstances reach to more than 80,000*l.* a year.

2274. Would not the immediate effect be to raise the rates of the accessible land, and would not the relation of landlord and farmer, as regards their relative interests, be just as it was before; would not the effect be to raise the value of property, and so raise the rent of the less accessible land?—I think the amount of the assessment would be so small on the acreage that it would be almost infinitesimal, and perfectly without effect in altering the relations of value in land, or those of landlord and tenant.

2275. I am asking you as regards the whole of the land, would not the immediate effect of this be that

the landlords would put on in the shape of rent all that the railways reduced in the shape of charge?—It would be the tendency of the landlord to do it no doubt, but he would scarcely find it worth his while to do it.

2276. Is there not such a competition for land as to keep the tenants at what may be called the lowest rate of tenant's profit?—Yes.

2277. Has not that been carried to such an excess that the tenant who is competing for the land will be content with even a less profit than he ought to receive with a view to the payment of his rent; has not that been the character of the relation of landlord and tenant?—That is unfortunately the fact. I do not think it arises so much from excessive rents as from the fact that the rent is not taken out of the land by the application of capital and industry to it.

2278. Has it not been from the extreme competition upon the part of the tenants to get possession of holdings?—In part.

2279. Are you not aware that if the landlord puts his farm up to bid by auction, or what they call in Ireland sets it, that he very often gets an active competition for taking the farm?—Yes.

2280. That being so, would not the immediate result of reducing the charge upon the produce of the land be to put the whole amount of that reduction after the next set of the farm takes place into the pocket of the landlord?—Yes; of course whether it was paid through the landlord in the shape of rent, or paid directly by the tenant, it would be a tax on what came out of the produce of the land, which is the source from which this and all taxes must come.

2281. Then the effect of the transaction would be this, that we should, out of somebody else's pocket put a great deal of money into the pockets of the landlord of the less accessible parts of Ireland?—I do not think practically that would be the result, for my impression is that, the guarantee would be found to be merely a just preservative against a possible contingent evil, but one that would to a very small extent come into play at all. I apprehend that after the first three years there would be no loss. I think it very questionable whether upon passenger traffic there would be any loss at all even at the very commencement.

2282. (*Chairman.*) To what extent do you think the passenger fares ought to be reduced?—I think the first and second class passenger fares ought to be reduced one-third if not one-half. The third and fourth classes for the working population I think should be reduced one-half, which would bring them to about a level with the continental Prussian, German, and French fares.

2283. (*Mr. Gower.*) Do you conceive there would be any danger, if you were to guarantee certain existing interests, of there being a great addition to the expense of the management of railways?—It is to guard against that, that I think Government control would be indispensable.

2284. (*Capt. Galton.*) What do you mean by Government control?—I mean that the working expenses of railways, their books, and their mode of conducting their business should be open to the inspection of competent Government officials at all times, in order that they may see that they were not engaging in reckless expenditure.

2285. Would not that fetter the whole of their proceedings most enormously? Would not that be practically taking the whole affair into the hands of these Government officials, or else referring every question to some central board to say whether anything can be done or not, and so create great delay?—I do not see that much difficulty of that sort would arise. I would only exercise a negative species of influence over the companies; I would not control their proceedings beyond a certain point.

2286. The question was whether the company would not be likely to be more careless in running their trains if there was to be this guarantee given to them. Suppose they put a train which was in the

Mr. R. Mallet.

12th May 1865.

Mr. R. Mallet. opinion of the government official not likely to produce full receipts, would he not be likely to stop that train, or would it not be taking away entirely the responsibility of the company if you fettered them by means of a government official?—Some sort of ultimate appeal might be necessary, but I think the government official's duty should be, in the first instance, merely to point out in such a contingency to the railway company, "You are putting on a train here which I consider to be extravagant and useless; you must modify it in some way." Of course it is very easy to multiply supposed difficulties to the working of any plan, but I apprehend in practice there would be no serious difficulty felt.

2287. (*Mr. Ayrton.*) Do you think it possible, if any loss was to be paid out of these rates, to have any specific contract made for any particular district, or would not the railways have to be placed under some general rules as to uniform mileage rates to be rigidly enforced all through the country?—Yes, I think there ought to be uniform rates established throughout the country for special classes of merchandize and passengers.

2288. Would not the whole system have to be managed under a set of public rules in which the subordinate officers would not be allowed to make any change or modification?—Clearly there should be some such rules, which I conceive, if judiciously drawn up would greatly avoid mere questions of detail.

2289. Do you think the effect of the officers working under those general rules, not being allowed any discretion, would or would not be to lead them into a more formal mode of conducting business, like as government business is generally conducted without any energy or enterprise and very little skill?—Of course you would bring in that element more or less; but I apprehend if the controlling power was one in itself exercising discretion and energy, that the difficulties would be very much less than they appear. I have always remarked that in any new project it is very much easier to find supposed difficulties than it is to vanquish them when they come in your way.

2290. Is not the tendency of all government administration upon a system of method and rule and general order, just the reverse of that which is supposed to be characterised by private enterprise?—That is not found to be quite universally the case, in Germany for example, where every branch of industry is, more or less under government control, yet the Germans are not deficient in individual energy, nor do they lie helpless on their backs waiting for providence, nor is the control found to degenerate into officious interference.

2291. Do you think that the absence of effective industry in Ireland results in any degree from the habit the people have acquired of relying on the State for so many things rather than relying on their own industry?—There was a feeling of that kind which had grown up many years ago, when a large portion of the population of Ireland, before the Famine, was employed upon public works as a means of finding employment for them, but I think that has greatly diminished of late years.

2292. Is there not a Board of Works in Ireland through which the Government undertake to do a great many things which in this country are done by local enterprise?—The functions of the Board of Public Works in Ireland are almost identical with those of the Office of Works here, and it has a central bureau in Dublin which to a certain extent controls the expenditure on all works connected with the State. There are very few things going on now in the shape of public works that could be done by private enterprise.

2293. Is not the drainage of Ireland going on?—The drainage is now all over. The landlords put an end to it, but they are beginning now to find out that they had better have left the Arterial Drainage Act alone, the want of which, in operation, they now feel.

2294. Do you think that the effect of the system to which I have alluded has been to direct the minds of

the Irish people to State assistance rather than to their own enterprise?—I think more has been made of that than is true.

2295. Do you think that the introduction of Government control over railways would tend to develop that private enterprise which you say is dormant, or the reverse?—I do not think you will have any rapid or great development of the industry of Ireland coming from the Irish people themselves, but if by altering the rates of freight on these Irish railways you were in a position to show that they could improve their condition by employing the material that Providence has thrown at their feet, and putting it into trucks for England, I think you would give them an incentive to follow our example here.

2296. Would not that be an indirect way of giving a bounty to any particular branches of industry if you carried goods at a less charge than would allow a profit to the people engaged in them?—Apparently so. I am ready to admit that the whole thing seems to conflict with theoretical political economy, but I do not think that theoretical political economy will turn out to be applicable to the facts in this instance.

2297. Do you think it possible if all the railways of Ireland were amalgamated into one system, or two or three large groups, that capitalists might be found who would be willing to lease the lines for a term of years, trusting to make their own profits from a better system of management, and a greatly increased traffic from a general reduction of charges?—I think that is not at all impossible. I say in answer to the first part of the question, that it would be of the utmost importance to amalgamate the lines, on account of the inconvenience which results at present from there being a number of little separate systems, for example, if you travel from Dublin to Belfast at present, you pass over what is in itself a continuous and not a very long line, and yet you travel through three if not four distinct railway properties, each with its little imperium of directors and officers, &c., and you are tormented at every hour to show your ticket, because you must show it at the end and at the commencement of every new property.

2298. (*Earl Donoughmore.*) Has such a plan as this ever occurred to you? Supposing that the Government were, by making acceptable propositions to the shareholders of these 18 companies in Ireland to become the proprietors of all the railways in Ireland, of course then they would become responsible for their obligations, and would become possessed of their assets; and then the State, having so made themselves the masters of the property, were to enter into an arrangement with a company to work and manage the lines upon certain conditions; first, with respect to rates for passengers and goods traffic, and also with reasonable accommodation to the public by the number of trains to be run in the day, and other conditions of that character, upon a lease for a certain fixed number of years: do you think it would be possible to get a great company to undertake that management on payment of such a rent to the Government, that they would be able, although perhaps losing something in the first period of the term, to recoup themselves in the latter period of the term in case there was a loss. I suppose the rent to be a rising rent?—I think it very likely that such an arrangement could be brought about. It would look a more symmetrical arrangement, probably than that which I have imperfectly sketched of a guarantee, but it would practically amount to the same thing. It would have to be a guarantee in any case. As regards the theoretical political economy of the thing, it is six of one and half-a-dozen of the other. If the Government became possessed of the railways, and assumed the responsibility of the companies, they must do either one of two things: they must either give leases at a low rent, which is tantamount to giving a guarantee, or they must take a reasonable rent as derived from corresponding traffic in England, or based upon the English lines, or upon the existing state of things on

the Irish lines, and then they would have to give a guarantee to the losses for a certain length of time.

2299. You are aware that a great portion of the capital which has been employed in making the Irish railways is borrowed capital, that is, capital raised up on debentures?—Yes.

2300. Upon that capital the railway companies are now paying a comparatively high rate of interest?—There would be no doubt considerable advantage in having the Government responsible for the interest, produced by the difference between paying a high rate and a low rate of interest.

2301. If the Government were to become the proprietors of the railways and responsible for their debts, as these debentures fell due the Government would be able to float them in the market at a far lower rate of interest than the companies themselves could ever expect to do?—Yes.

2302. Therefore, in that respect, as time went on, the Government would make a saving every year?—Clearly.

2303. That would be one source from which in time they would expect a reduction in the charges?—Yes.

2304. Then might it not be so arranged that the rent payable by the managing company to the leasing company should be a rising rent, perhaps not the first year or two, but rising gradually at fixed periods. Do you think it might not be possible, taking into consideration those two elements, first, a reduction of the charges arising from the debentures being gradually floated in the market at a lower rate of interest, and, secondly, the periodical raising of the rent payable to the company, that at the end of 21 years the Government might find itself entirely recouped?—I think the Government would find itself recouped, and probably within a shorter period, but I apprehend there would be found considerable difficulty in getting railway companies or proprietors who would speculate in Irish lines if you made such a reduction in the fares as would alone be likely to make the experiment successful in the end. If you were to reduce the fares to one-half or one-third of what they are now, I dare say you might still get them to undertake it, but I think they would undertake it only upon terms commensurate with the risk.

2305. I understand from your last answer that you do not feel quite so sure that the experiment of the reduction of the fares to half would be successful?—No. What I have just stated is not from any doubt on my own part as to the effects of the change, but from the difficulty of convincing those whose knowledge must necessarily be imperfect, and who would have the risk of advancing the money, and would take care to secure terms commensurate to their greatest supposable risk.

2306. (*Mr. Gower.*) I suppose you consider that on every railway a reduction of fares would prove advantageous?—I think so. I am quite satisfied that on some of the lines the effect would be almost

Adjourned to Wednesday next at 12 o'clock.

Wednesday, 17th May 1865.

PRESENT :

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE HON. E. F. LEVESON GOWER, M.P.

GEO. CARR GLYN, Esq., M.P.
A. S. AYRTON, Esq., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, Esq.
J. R. MCLEAN, Esq., Pres. Inst., C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. JOHN RICKARD TINSLEY examined.

2308. (*Chairman.*) You are mayor of Limerick?—Yes.

2309. Are you connected with the Chamber of Commerce in that city?—Yes.

electrical. Perhaps upon others the effect would be much slower, but I apprehend that within three years the advantage would be without question.

2307. But still you would recommend the same reduction to all railways?—I think in Ireland, to which I have alone referred, you would have to establish uniform rates both for goods and passengers all over the country. I do not see upon what principle you could take any other method.

Statement referred to in the Answer to Question 2180.

COST OF WORKING COAL OR MINERAL TRAINS.

Each train consisting of 30 waggons, with break-van, for a nett load of 200 tons average.

Cost of transport per train mile.

	Pence.
Locomotive power - - -	9·50
Maintenance of way - - -	1·00
Attendants on train - - -	1·00
Use, wear and tear of waggons - - -	3·50
Signal lamps - - -	0·50
Offices and general management - - -	1·00

Cost per train mile on a level - - - 16·50

As the mean co-efficient of traction for waggon trains in good order is $\frac{1}{270}$, the only effect on the above of a gradient is proportionately to increase the consumption of fuel. The cost for fuel only per train per mile, included in the part mentioned above, (coal being at 14s. per ton), is 2·60 pence.

Hence we shall have with a gradient of 1 in 270. The cost per train mile - - - 16·50 + 2·60 = 19·10 Pence

Or with a gradient as steep as 1 in 90 - - - 16·50 + (3 × 2·60) = 24·30

But the return on the nett load of 200 tons at one farthing per ton per mile is = 4s. 2d.

So that on a level line the nett profit returned will be—pence. pence. pence.

50 — 16·50 = 33·50 or rather more than 200 per cent., and upon a continuous gradient as steep as 1 in 90—

pence. pence. pence.
50 — 24·30 = 25·70 or rather more than 100 per cent.

If the trains as proposed carry coal one way and return filled with minerals, the same rate of profits will be returned for the double journey, or each way.

If however the waggons return empty, the cost of return transport may be taken as follows:—

Engine and empty train per mile,—

Locomotive power - - -	8·00
Maintenance of way - - -	0·80
Attendants on trains - - -	1·00
Wear and tear of waggons - - -	2·00
Signal lamps - - -	0·50
Office of general management - - -	1·00

Cost per empty train mile on level - - - 13·30

Or with a continuous gradient of 1 in 90, add - 5·50

Pence 18·80

It is thus obvious that with such coal trains, returning empty waggons, a freight charge of less than one halfpenny per ton per mile would yield an ample profit.

Mr. R. Mallet.

12th May 1865.

Mr. J. R. Tinsley.

17th May 1865.

Mr.
J. R. Tinsly.
17th May 1865.

plaint to make as to the accommodation or as to those fares?—They have not authorized me to make a complaint.

2312. Has the management of the Irish railways been under the consideration of the Chamber of Commerce, and have any faults been found with respect to the traffic to Limerick?—It has not been under the consideration of the Chamber of Commerce as a body; but the directors of the Chamber have had the subject under consideration, and requested me to appear here to give my impressions upon it. The members have considered the matter amongst themselves individually.

2313. Have you individually any cause to complain of the arrangements on the Irish railways?—Yes.

2314. Will you state generally to the Commission on what points you have to make complaint; first as to the passenger traffic?—With respect to the passenger traffic, it is generally complained that the charges are too high, which prevents that intercourse with the western districts of Ireland that we would otherwise have if we had a lower rate upon the traffic from the metropolis and a lower rate of passenger charge.

2315. Do you ground your opinion that the traffic would be much increased by lower fares upon any facts, or, speaking generally, is it your opinion that low fares would naturally have that effect?—That is the general opinion of the gentlemen with whom I have been speaking and also my own.

2316. Have any experiments ever been tried between Dublin and Limerick with a low scale of charges?—Not that I can recollect.

2317. What is the fare from Dublin to Limerick?—23s. 8d. first-class.

2318. (*Mr. Glyn.*) What is the distance?—I think the distance is about 129 miles.

2319. (*Lord Donoughmore.*) By which route do you mean?—By the junction.

2320. (*Capt. Galton.*) What is the distance by the Roscrea route?—I have not got the particulars of that.

2321. (*Chairman.*) What is the second-class fare?—17s. 8d.

2322. What is the third-class fare?—10s. 9d.

2323. In the opinion of business people at Limerick is there a sufficient number of trains each way daily?—We want a four o'clock train from Dublin to Limerick; the train at present leaves at one o'clock and arrives at half-past six, and the persons engaged in trade travelling from Dublin consider it a very great inconvenience to be obliged to leave so early, or they must wait till a late hour.

2324. (*Capt. Galton.*) Can you leave Limerick in the morning and go to Dublin and return in the evening?—No.

2325. At what time does the morning train start to Dublin?—The general train is the 11 o'clock mail train.

2326. How many hours is that going to Dublin?—There is a delay of two hours at the junction; it gets to the junction at 20 minutes past 12, and remains there till the Cork train comes up, and it is a late hour in the evening when it gets into Dublin. I have travelled by the four o'clock train, and it gets to Dublin at half-past nine, taking five hours and a half.

2327. Is there a morning train to Dublin?—Yes, it leaves at 6 o'clock in the morning.

2328. When does it reach Dublin?—It is due, I think, at half-past 11.

2329. There is no train which travels between Limerick and Dublin in less time than five and a half hours?—No.

2330. (*Chairman.*) Going a distance of 130 miles?—Yes.

2331. (*Mr. Glyn.*) You cannot return the same afternoon, can you?—Yes.

2332. What time can you leave Dublin?—At one o'clock.

2333. You only arrive at half-past 11 by the first train, and you must then leave at 1 in order to

return?—If you return the same day you should; but in fact I do not know of anyone going up in the morning from Limerick and returning the same day; you cannot do it, you would not have time to transact business.

2334. You cannot return the same day?—Not since the four o'clock train was taken off; there was a four o'clock train that landed passengers at half-past nine in Limerick.

2335. (*Lord Donoughmore.*) There is a night mail train to Limerick?—Yes.

2336. (*Capt. Galton.*) When does it leave Dublin?—I cannot tell you the exact hour; it is after the arrival of the Kingstown mail.

2337. (*Mr. Glyn.*) What time does it reach Limerick?—At half-past one in the morning.*

2338. (*Mr. Horsfall.*) Do they issue return tickets upon that line?—They do for the same day.†

2339. But they are comparatively valueless, are they not?—Yes.

2340. (*Chairman.*) Do you believe that any large number of persons in Limerick are prevented from going to Dublin for want of sufficient railway facilities?—Yes; I think that a great many persons would travel to and from Dublin if there was a lower rate of charge.

2341. (*Lord Donoughmore.*) If they could return the same day?—Yes.

2342. (*Sir R. Hill.*) Why was the four o'clock train discontinued?—I do not know.

2343. Were there many passengers who travelled by it?—Yes, a great many.

2344. (*Mr. Glyn.*) Is there much intercourse between Dublin and Limerick?—Yes.

2345. Would that be increased, in your opinion, if facilities were afforded for a daily return train to and from those places?—Yes.

2346. Is Limerick a market that the Dublin people look to very much?—There is a great deal of business done between those two places.

2347. (*Chairman.*) Is there much communication between Limerick and Cork?—There is.

2348. Are the trains convenient between those two places?—Yes, they are.

2349. More convenient than between Dublin and Limerick?—Yes.

2350. Do you attribute the want of accommodation to the means of communication being in the hands of two different companies?—I should suppose that it would be more convenient if the matter was in the hands of one company, and that it would be more easily arranged.

2351. Between Limerick and Waterford what accommodation is there; are there as many trains as you want?—I believe so; there is not much passenger traffic between Limerick and Waterford.

2352. And perhaps there never will be?—I do not know that; it may be promoted. I have not heard any complaint of want of trains.

2353. (*Capt. Galton.*) Do the Limerick people come to England by Waterford?—They do; but I have never travelled that way myself.

2354. It is the cheapest route, is it not?—Something cheaper than the other, but the sea passage is longer.

2355. (*Mr. Ayrton.*) What is the class of the population who require additional railway accommodation; are they private residents, or merchants, or retail traders chiefly?—Merchants and traders.

2356. How many wholesale merchants are there in Limerick?—I suppose about from 30 to 40.

2357. Do the retail traders in Limerick deal much directly with Dublin, or do they deal with the wholesale merchants in Limerick?—They deal with the

* Witness subsequently explained that there was an error in the times given in the text. The morning train to Dublin started at 7.30 a.m., arriving at 3.35 p.m., and the return train to Limerick left Dublin at 7.45 p.m.

† Return tickets were available for next day.

wholesale merchants in Limerick, and a good many of them deal in Dublin also.

2358. Have you any resident population at present residing in Limerick of independent fortune, who may be termed idle persons?—Not resident in the city; there are some, but not very many.

2359. (*Capt. Galton.*) What is the population of Limerick?—Something under 50,000.

2360. (*Mr. Horsfall.*) Is there any great trade in cattle between Limerick and Dublin?—Yes.

2361. Are they sent by railway or by road?—By railway principally, I believe.

2362. What are the rates charged for cattle?—I do not know the rates for cattle.

2363. (*Mr. Ayrton.*) Do many travellers come to Limerick from the wholesale houses in Dublin with samples to take orders, or do they go out from Limerick to the surrounding districts?—A good many.

2364. By what class do they travel?—I am not very certain what class they travel by.

2365. (*Mr. Horsfall.*) Are the fares, in your opinion, considerably too high between Limerick and Dublin?—Yes. I have heard it generally complained of, that the fares are high, and that if they were reduced it would increase the trade and business of the city of Limerick, as well as give greater facilities for travelling, and many more persons would travel.

2366. It would increase the traffic both in passengers and goods?—Yes.

2367. (*Chairman.*) Have you any reason to suppose that the third-class passengers would increase in numbers by a reduction of the fares?—I think they would be very much increased.

2368. Do you ground that opinion upon any facts within your own knowledge?—Not particularly within my knowledge, but from having heard it spoken of.

2369. Is there any third-class passenger traffic between Dublin and Limerick, or is it chiefly from places in the neighbourhood of Limerick?—The larger proportion would be from Limerick. I believe that there is only one third-class train which leaves Limerick in a day, and that is very early in the morning—7.30 a.m.

2370. Do you think that, under any circumstances, any considerable third-class passenger traffic could arise between Dublin and Limerick?—I think it would.

2371. (*Mr. Ayrton.*) From what cause would it arise?—From a reduction in the rates.

2372. What third-class traffic would it be, persons going to pay visits in Dublin, or going there for occupation?—Persons going to Dublin for occupation.

2373. And when once they had gone they would remain in Dublin?—They may not.

2374. Do you mean that people would go there to be employed for a short time with the view of coming back?—Yes, tradespeople.

2375. Do the people in Limerick travel third-class when they go to Dublin?—I am alluding to tradesmen.

2376. Do you mean workmen?—Yes.

2377. Is there much movement of workmen between Limerick and Dublin?—Yes, at times. When there was a considerable amount of work in Dublin, and they required tradesmen, they would go from Limerick—labourers also—and come back again as soon as they found it convenient to come back to their families. I think there would be a good deal of third-class passenger traffic in that way created by a moderate rate of charge.

2378. What reduction in the rate would induce them to go up to Dublin in that way for employment for short periods of time?—I think about half of what it is now.

2379. (*Chairman.*) Is there any considerable influx of people into Limerick on market-days?—Yes, very great.

2380. How many market days have you in the week?—Two.

2381. From what distance do persons come into Limerick?—20 and 30 miles.

2382. Do a large number of them come by railway?—Yes, and for considerable distances too—20 miles—but for the short distances they consider it cheaper to come in on their own horses and carts.

2383. (*Capt. Galton.*) Do the railway companies run excursion trains on the market days?—No.

2384. They do not allow the third-class passengers to come in at a lower rate with a return ticket?—No.

2385. Do they issue no return tickets?—I do not think they do.

2386. (*Mr. Ayrton.*) Are there steamboats on the lower Shannon from Limerick?—Yes.

2387. Are they crowded with passengers?—They are not crowded with passengers, except in the summer season.

2388. Is that pleasure traffic or business traffic?—Both.

2389. Do you know the rates at which they carry passengers on the Shannon?—It is 2s. from Limerick to Kilrush; 3s. for first-class passengers.

2390. (*Chairman.*) Is there any large permanent population at Kilrush?—Yes, there is a large population.

2391. (*Mr. Hamilton.*) What is the distance from Limerick to Kilrush?—About 46 miles.

2392. (*Capt. Galton.*) Is there much traffic to Foynes?—No, there is not.

2393. (*Mr. Glyn.*) Did you say that they issued return tickets for the first-class passengers from Dublin?—I think they do.

2394. At what rate?—A fare and a half is the usual rate.

2395. (*Mr. Hamilton.*) I thought you said that that would only be good for the same day?—That is all.*

2396. Before that you could have gone to Dublin and have returned the same day?—Yes, but you cannot do that conveniently since the four o'clock train has been taken off.

2397. Then what is the good of a return ticket?—I suppose no one would take one now. I have not done so myself.

2398. Practically a return ticket is of no great value?—None whatever.

2399. (*Chairman.*) Have the fares been the same as they are now for many years?—They have been so.

2400. Has there been no alteration made, either in raising them or lowering them?—I think they have been advanced; three years since I think the fare was 21s., I am not certain, and it was advanced to 23s. 8d.

2401. (*Mr. Hamilton.*) What is the ordinary line of communication between Limerick and England?—Through Dublin.

2402. Have you through rates by way of Dublin for passengers?—Yes.

2403. There is another line of communication by way of Waterford, is there not?—Yes.

2404. Can you book through by way of Waterford?—Yes, I believe so.

2405. (*Mr. Ayrton.*) Is it cheaper by way of Waterford than by Dublin?—Yes.

2406. Why do not persons go by Waterford?—The longer sea voyage prevents it.

2407. (*Chairman.*) Have they as good boats?—I have heard that they are excellent boats. I have not travelled in them.

2408. Pigs go over in those boats, do they not?—Yes, and cattle.

2409. (*Mr. Hamilton.*) You do not know whether you can book through from Limerick to Milford?—I do not, but I think I have seen it in one of their booking tables that you can do so.

* See note to question 2338.

Mr.
J. R. Tinsly.
17th May 1865.

2410. (*Chairman.*) Are there any complaints in Limerick as to the charges upon the carriage for goods?—Yes.

2411. Will you be good enough to state the nature of those complaints?—Some time since the different railways into Limerick, the Great Southern and Western, and the Waterford and Limerick, carried goods through from Liverpool to Limerick at a through rate of 15s. per ton.

2412. (*Mr. Dalglisch.*) What class of goods do you refer to?—Heavy goods, iron, tallow, palm oil, sugar, and such heavy goods, and within the last two or three years they advanced the rates to 27s. and 30s. a ton, something equal to from 80 to 100 per cent., and we consider that that has done very considerable injury to the trade of our locality.

2413. (*Chairman.*) Are you able to state that the traffic of that description has fallen off since the raising of the charges?—It has.

2414. (*Mr. Ayrton.*) Are the sea risks included in the rates you have mentioned, or are they thrown upon the freighters; does the company bear the sea risk?—No, you have to insure.

2415. Are the goods carried over sea subject to the ordinary sea risks?—Yes.

2416. (*Lord Donoughmore.*) The Waterford and Limerick route to Liverpool is made up of the Waterford and Limerick line from Limerick to Waterford and the steamship company from Waterford to Liverpool?—Yes.

2417. The Great Southern and Western route is made up as far as the junction with the Waterford and Limerick and from the junction to Dublin of the Great Southern and Western, and from Dublin to Liverpool by the City of Dublin Steam Packet Company?—Yes.

2418. In order that there should be a uniform through charge by both routes, it is necessary to have an agreement between five companies, is it not?—Yes, the Cork Direct Company is now just as much interested as either of the others; it is another means of importing goods to Limerick and of exporting.

2419. Have you not some traffic by sea from Limerick to Liverpool direct?—Yes.

2420. What are the rates?—Twenty shillings; formerly it was only 12s. 6d.

2421. Who are the parties who are the owners of steamboats?—They are Limerick merchants.

2422. You stated, I think, that the railway companies charged 15s. a ton?—Yes, but now they charge 27s. When the railway companies were charging 15s. the Limerick Steamship Company charged but 12s. 6d. a ton.

2423. Is there not another route from Limerick to Liverpool by the river Shannon and the Midland line from Athlone to Dublin?—Yes, there is, but their rates are proportionately high.

2424. (*Capt. Galton.*) Is there not a route by Cork?—Yes, but they have advanced the charges; there is a combination amongst the companies to make those extra charges, and they have compelled or induced the Limerick Steamship Company to make the same high rates of charge proportionately with the longer sea voyage and the greater risk. They gave them an opportunity of charging from 20 to 30 per cent. lower than the railway charge. There are heavy town dues upon goods in Limerick coming by the long sea voyage, and also the uncertainty of so long a voyage from Limerick to Liverpool direct. They have given them the advantage of the difference between 20s. and 27s.

2425. What is charged by the River Shannon and the Midland route from Limerick to Liverpool?—I think it is 24s. 9d. to Limerick.

2426. That is cheaper than by the other route, by the Great Southern and Western?—Yes, it is 24s. 9d.

2427. (*Mr. Ayrton.*) Why is not the sea route used in preference, the charge being 20s. against 27s.?—Because it is a longer sea voyage, and there is also uncertainty as to the time of the sailing of the boats. They do not sail so regularly as they do from Cork

and Dublin or from Waterford, and they have undertaken to pay heavy town dues, as much as 3s. 4d. a ton, in addition to the freight at Limerick, upon some of those articles.

2428. Referring to the articles which you have mentioned, do you suppose that that increased charge of 7s. a ton interferes with the consumption of goods in Limerick?—It interferes with the trade of Limerick, but whether it interferes much with the consumption of goods there I cannot say.

2429. Have you any reason to suppose that the consumption of those articles is diminished in Limerick by reason of the charge made for conveyance being increased to the extent you have stated?—I do not go the length of saying that.

2430. Sugar, for instance?—I cannot say.

2431. How then does it interfere with the trade?—It enables the merchants of Dublin and Waterford and of Cork to import goods at a freight I think of 10s. or 15s. into those places, and then they can send them within a very short distance of Limerick to some of the smaller towns, to the disadvantage of the Limerick import merchants.

2432. That is in competition one port with another in Ireland?—Yes.

2433. Is not that the necessary result of situation, the one being better situated than the other, and being nearer to the market or place of production, so that they can send the goods cheaper?—No, I do not think it is so in this case.

2434. Do you propose that the rates should be adjusted with a view to placing a more distant port on the same footing as a port nearer to the place of production?—The increase in the charge by the railway company to 27s. has been attended with this disadvantage as regards Limerick, that it has compelled our local companies or it has induced them to advance their rates to 20s., whilst goods of the same class are imported into Dublin, Cork, and Waterford at 10s. or 15s.

2435. If the increase of the rate does not interfere with the consumption of the articles, the reduction would simply have the effect of making you a present of so much per ton to enable you to carry on your business in competition with the merchants of Waterford and Dublin?—We should have equal rates with them.

2436. But it would in effect be asking the railway companies to give you a sort of bounty or present to enable you to compete with the merchants of Waterford and Dublin?—Not to make it a present, the fact is the goods now do not come by the railways; in fact the rate is a prohibitory rate, for since they advanced it to 27s. the goods have scarcely come by the railways at all.

2437. I thought you stated that the grievance was that the goods were sent from Waterford a distance that brought them too near to Limerick, and that they ought to be sent from Limerick into the interior?—Yes, that is to places nearer to Limerick; a district that ought to be in connexion with Limerick is taken advantage of by a more distant city.

2438. The effect of a reduction would be to give you a bounty to that extent, and so enable you to send your goods further into the interior?—Not a bounty, but to give us the advantage of our local position.

2439. Are you not now suffering from the disadvantage of your local position by being further from Waterford or from Wales, where the iron is produced?—I think very little.

2440. What would be the difference in freight by sea from Cardiff to Waterford, as compared with from Cardiff to Limerick?—About 2s. a ton.

2441. (*Chairman.*) Is there any understanding between the Limerick Steam Ship Company and the railway companies as to the rates which they are to charge?—Yes.

2442. Have any of the railway companies an interest in the Limerick Steam Ship Company?—I believe one company has got some shares in it, one of

the managers ; but there is an understanding between them, and a combination that none of them will take lower rates than those which I have named.

2443. Do all the steamboats trading to Liverpool belong to one company ?—Yes.

2444. Has there ever been any proposal among the merchants of Limerick to set up steamers on their own account ?—No, not in opposition.

2445. (*Capt. Galton.*) Who are the proprietors of the Limerick steam boats ; are they Limerick people ?—Yes.

2446. Are they merchants in Limerick ?—Yes.

2447. Persons having an interest in the charges made for goods ?—Yes.

2448. Does their interest as proprietors in the Steam Packet Company overweigh their interest as merchants ?—Yes, and that makes them raise their rates.

2449. (*Chairman.*) Does the whole of the traffic from Liverpool now come by steamboats ?—Yes, nearly all of it.

2450. (*Mr. Ayrton.*) Did they, in your opinion, make a large profit when they charged 12s. 6d. a ton ?—No.

2451. Did they make any dividend at all ?—Yes, they did.

2452. Why did they not continue to charge 12s. 6d. a ton ?—Because I believe it was threatened that there would be an opposition if they did so.

2453. (*Mr. Hamilton.*) An opposition promoted by whom ?—By the railway companies.

2454. (*Mr. Ayrton.*) You mean that there would be more steamers put on if they continued that charge ?—Yes, very likely.

2455. (*Capt. Galton.*) Are you in business in Limerick ?—Yes.

2456. In what trade ?—I am an import merchant.

2457. Do you import any goods by means of the railways ?—I have not done so for the last three or four years, or scarcely anything by the railways, but I did a great deal, almost all my business, by the railways until they advanced the rates ; my goods are now carried by the direct steamers.

2458. (*Mr. Ayrton.*) Are the Commissioners to understand that the raising the rates from 12s. 6d. to 20s. has had the effect of preventing opposition by sea ?—Yes.

2459. (*Mr. Horsfall.*) Opposition by the railway companies ?—Yes.

2460. (*Mr. Ayrton.*) Is it open to anyone to offer opposition ?—Yes.

2461. If 12s. 6d. is a profitable rate, how can you account for no one proposing to carry goods for that rate ?—I do not know why persons do not do it.

2462. (*Mr. Hamilton.*) I understand you to mean this, that unless the steamboat company raised their rates to 20s. they would be run off the line, or would be met by active competition on the part of the railway companies ?—Yes.

2463. (*Mr. Glyn.*) Can any of the railway companies establish steamboats ?—Not as railway companies, but as individuals they could do it.

2464. (*Mr. Hamilton.*) In the interest of the railway companies ?—Yes.

2465. (*Capt. Galton.*) What advantage has it been to the railway companies to raise the rates by the steamboats, seeing that by raising their own rates, as you say, they have driven all the traffic off their line of railway ?—It takes the traffic direct to Limerick off their lines ; but it gives them a great advantage as to the traffic coming within 20 miles of Limerick.

2466. (*Chairman.*) You mean the traffic from Dublin along the line ?—Yes ; the goods are imported into Dublin, into Waterford, and into Cork, and this has interfered with the direct trade to Limerick, while it has given the merchants of those places the advantage of supplying places all along the line.

2467. (*Capt. Galton.*) Has the result been to raise the price of goods in Limerick ?—To that extent.

2468. Do you sell iron, for instance, in Limerick at a higher price ?—Yes, to that extent.

2469. Is coal dearer in Limerick than it used to be ?—It is rather dearer.

2470. What is the price of coal ?—About 20s. a ton.

2471. How is coal brought to Limerick ?—The greater part of the coal is brought by steamers.

2472. By steam colliers ?—Yes, and trading vessels.

2473. Where is it brought from ?—From Liverpool and Newcastle, and some is brought from London and from Glasgow.

2474. Do the vessels come laden with coal only ?—No ; they take in about half a cargo of coals and fill up the remainder with goods.

2475. Does any coal come from South Wales ?—Very seldom.

2476. How does it come from South Wales ?—It comes by sailing vessels from South Wales.

2477. And that coal costs 20s. a ton, delivered at Limerick ?—Yes, there are steam coals as low as 16s. or 18s. a ton.

2478. Is much coal carried from Limerick into the interior of the country ?—A great deal.

2479. The price is consequently enhanced beyond Limerick ?—Yes.

2480. (*Mr. Ayrton.*) Is the trade in coal a close trade, so that the freights are regulated by any combination, or do the rates result from ordinary competition in the market ?—I think the prices are regulated by ordinary competition in the market.

2481. (*Mr. Dalglish.*) What is the distance between Liverpool and Dublin, as compared with the distance between Liverpool and Limerick ?—It is about one-half the distance, or less than half.

2482. Perhaps one-third ?—Yes.

2483. Do you know what the freight is from Liverpool to Dublin ?—From 10s. to 15s. a ton.

2484. Are there any town dues to be paid in Dublin ?—I believe they have some small dues.

2485. The freight by steamboat is from 10s. to 15s. from Liverpool to Dublin ?—Yes.

2486. But you do not know anything about the town dues ?—They are very light. I believe there are dues, but very light ones.

2487. Nothing to compare with 3s. 4d. ?—No.

2488. If you add 3s. 4d. to 20s. that gives you 11. 3s. 4d. ?—Yes.

2489. So that at Limerick you get goods carried from Liverpool to Limerick for about a third of the price that they would be carried from Liverpool to Dublin for ; that is to say, the cost of goods to Limerick is 11. 3s. 4d. per ton, including your town dues, whereas the cost of goods to Dublin is from 10s. to 15s. per ton—take 12s. 6d. as the average—and the town dues you say are very light ; you get your goods from Liverpool to Limerick by steamer for 11. 3s. 4d. per ton, the distance being nearly 500 miles, and the Dublin people pay 15s. per ton, the distance being only 120 miles ?—Yes ; the same rates apply both to Waterford and Cork as to Dublin, although the distances are greater.

2490. (*Mr. Horsfall.*) The insurance from Limerick to Liverpool is considerably more than from Liverpool to Dublin ?—I suppose it is about 2s. 6d. per cent. more to Limerick than to Dublin.

2491. (*Chairman.*) When the charges upon goods were raised from 15s. to 27s. was it stated by the railway companies that the old fares were unremunerative ?—I do not know that they made any public statement to that effect.

2492. (*Capt. Galton.*) Do you know what the charge is upon goods from Dublin to Limerick by railway ?—It is 15s. a ton for the same class of goods.

2493. Is there any steam communication between Dublin and Limerick ?—There is canal communication, and also by the upper Shannon.

2494. What is the freight by that course ?—I think it is 12s. 6d.

2495. (*Lord Donoughmore.*) Is not the differential rate settled by the canal company in concert with the

Mr.
J. R. Tinsly.
17th May 1865

Mr.
J. R. Tinsly.
17th May 1865.

railway company?—I presume it must be; they will not carry for less.

2496. (*Capt. Galton.*) With regard to the cost of coal, can you explain of what the charge of 20s. per ton is made up, because we have been informed by other witnesses that the freight was 5s. a ton from Wales to Limerick?—It is no such thing, at least that I am aware of. I think that 8s. is the freight by sailing vessels.

2497. From what place?—From Wales or from Liverpool.

2498. What is the cost of the coal put on board ship?—The Welsh coals are not generally used for housekeepers' purposes, and the price is about 18s. I spoke of housekeepers' coal when I said 20s.

2499. What is the freight from Newcastle?—12s. 6d.

2500. What is it from Liverpool?—8s.

2501. What is the price of the coal put on board ship in the river Mersey?—I think from about 7s. 6d. to 8s. a ton.

2502. Are there any town dues to pay in Limerick for the coal?—Yes.

2503. What is the rate paid for town dues?—3d. per ton.

2504. (*Mr. Horsfall.*) The coal which you speak of as being put on board ship in the Mersey is called smiths' coal, is it not, at 7s. or 8s. per ton, and not household coals?—I think that there are some household coals put on board at 7s. 6d. a ton, but there is a better class of coals than those; some are as high as 9s. a ton.

2505. (*Lord Donoughmore.*) What would orrel coal be if put on board at Liverpool?—I do not know; but I believe there are two or three classes of orrel coals.

2506. When you state that the price of housekeepers' coal at Limerick is 20s. a ton, does that include the orrel coal?—I think there would be some of that coal as high as 22s., but I give you the average price at about 20s.; the price of some goes as high as 22s., and probably some runs to 24s.

2507. (*Mr. Ayrton.*) Is turf much consumed in the neighbourhood of Limerick?—Yes, a good deal.

2508. How close to Limerick is it to be obtained?—Within 6 miles.

2509. Is it much used in the city of Limerick?—It is not so much used as it was, but turf is getting scarcer and dearer, for, in point of fact, the bogs are being worn out, and labour is not so cheap.

2510. Can you state the relative prices at which turf and coal come into competition with each other?—When turf goes beyond 3s. 6d. a kish it is generally considered dear. All last winter it was as high as 5s. a kish.

2511. (*Capt. Galton.*) What is a kish?—It contains a certain quantity of turf; in fact, it is a horse-load.

2512. How many kishes go to a ton?—It is not weighed; a great deal depends upon the quality of the turf; some bogs are very heavy and others are very light.

2513. (*Lord Donoughmore.*) When you say 3s. 6d. a kish, is that good Clare hand turf or common cut turf?—Good turf, or hand turf.

2514. (*Mr. Ayrton.*) Do you mean to say that when turf is more than 3s. 6d. a kish it is cheaper to burn coal?—It is generally supposed to be so, because coals are found to go more into consumption.

2515. (*Mr. Hamilton.*) Do you think there is likely to be an increase in the consumption of coal in Limerick and the neighbourhood?—Yes, I think so.

2516. Owing to an increasing scarcity of turf?—Yes, and also a scarcity of labour.

2517. (*Mr. Ayrton.*) When you say that it is cheaper to buy coal than to buy turf, you assume that the coal is 20s. a ton?—Yes.

2518. And the turf at 3s. 6d. a kish?—Yes.

2519. What is the price of turf per kish at the present time?—About 4s.

2520. How far from Limerick will the price be reduced below 3s. 6d. by reason of economy in the cost of conveyance?—Perhaps 10 or 15 miles.

2521. (*Lord Donoughmore.*) Does not a good deal of turf come from very low down the Shannon?—Yes, a great deal of it comes from Kilrush and that district.

2522. (*Mr. Ayrton.*) Is any turf brought in by railways?—Yes, from Castle Connell there used to be; but the charge was so high that they were obliged to give it up.

2523. (*Chairman.*) Is any coal brought into Limerick by railway?—There was, but there is not so much now.

2524. Where did it come from?—From Waterford and also from Cork, but principally from Waterford.

2525. (*Mr. Hamilton.*) What is the present rate charged by the railway companies for coal?—I cannot tell you, for I do not know, but somewhere about the same as the Limerick price now charged by the steamship company.

2526. What is the rate per ton per mile that is charged by the railway company on coal from Cork or Waterford?—From Waterford to Tipperary they charge 4s. 9d. a ton.

2527. What would that be per mile?—The distance is 55 miles to Tipperary.

2528. And the charge is how much?—4s. 9d.

2529. (*Capt. Galton.*) Does the coal go from Limerick into the interior of the country now?—Not much.

2530. Where does the coal that is supplied in the interior come from?—It comes principally from Waterford and from Cork.

2531. At what price could you get coals delivered in Limerick through Waterford?—I will give it you to Tipperary, that is within 22½ miles of Limerick and 55 miles from Waterford.

2532. At what price is the coal sold in Tipperary?—I will give you the rate of charge first to Tipperary. The rate to Tipperary is 4s. 9d. per ton from Waterford. I believe the distance is 55 miles. Then from Limerick to Tipperary I find they charge 3s. 3d. a ton, and the distance is 22½ miles, and that is a very great disadvantage to Limerick in sending coals into the interior.

2533. Has the railway company ever been remonstrated with with respect to that disadvantage?—Yes, I have remonstrated with them, and as to another article in which I deal largely, salt, they did advance the rate, and then they reduced it again.

2534. What is the rate at the present time?—At the present time it is 4s. 9d. to Tipperary, and 3s. 3d. from Limerick to Tipperary; that is, for a distance of 55 miles they charge, as I said, 4s. 9d., and for 22½ miles they charge 3s. 3d., which gives a great advantage to Waterford over Limerick.

2535. (*Mr. Hamilton.*) Do you include in the price of coal at the port of Waterford good domestic coal?—No, I do not.

2536. You do not know what it could be put on a railway truck for at Waterford, coming by sea to Waterford?—That depends upon the rate of freight to Waterford.

2537. (*Chairman.*) As far as the coal traffic is concerned, you think there is not much opening for the introduction of coal into Limerick by railways, and for the distribution of coal from Limerick?—Yes.

2538. You do not anticipate under any circumstances it is likely that Limerick would be supplied with coal for its own consumption by railway?—Not so long as we have direct steamers, because they must bring coals as ballast. As long as they trade and bring goods, they must carry a certain quantity of coals underneath the goods.

2539. (*Lord Donoughmore.*) And that you think would be almost sufficient for the local consumption?—No, not if we had the same amount of trade that we had before the railway company reduced their charges.

2540. They increased them, did they not?—No, they have reduced them for certain distances within 20 miles of Limerick.

2541. But what I referred to was the consumption of coals in the city of Limerick, as distinguished from the consumption of coals in the surrounding district?—Then it would not be sufficient.

2542. (*Capt. Galton.*) Do you know at what price coal is sold at Tipperary?—No, I am not aware of that at the present moment.

2543. Are there facilities now at Limerick for putting the coals direct on to the railway trucks from the ships?—No, they have to be carted from the ships.

2544. For what distance are they carted?—From about half a mile to a mile.

2545. What is the cost per ton for carting the coal?—From 6*d.* to 1*s.*

2546. That charge has to be added to the cost of the railway freight?—Yes.

2547. (*Chairman.*) Besides the coal traffic, are there any other descriptions of goods traffic with respect to which you have complaints to make against the railway companies?—The only thing is that the general rate which they charge is 27*s.* per ton for those goods coming from Liverpool.

2548. I am referring to traffic confined to Ireland—internal traffic?—No, I am not aware of any other.

2549. (*Capt. Galton.*) You have mentioned salt?—Yes.

2550. Do you send salt into the interior from Limerick?—Yes.

2551. To what parts of the interior?—To Tipperary, Charleville, Roscrea, Ennis, Kilrush, Tarbet, and to very considerable distances round Limerick.

2552. (*Mr. Ayrton.*) Do you know of any commodity produced in the interior that would be brought to the port of Limerick in greater quantities than it is now if the railway charges were greatly reduced?—I think that turf would be brought in greater quantities.

2553. Can you mention any other commodity?—As it is principally an agricultural country I suppose corn would be, because it must find a market somewhere if it does not find a market in Limerick.

2554. The surplus corn that remains after feeding the population in the interior, I presume, is brought to market?—Yes.

2555. Then there could be no great increase in that unless there was an increase in the products of agriculture?—No.

2556. Is there any particular reason why you think there would be any great increase in agriculture?—Not unless we had an increase in population, which I do not think we shall have. If we could get better prices for corn there would be an inducement to sow corn.

2557. Is there any other commodity that you think might be increased and sold in greater quantities in the interior if it were brought at a cheaper rate to Limerick?—Besides corn there is butter, and all other agricultural produce would be increased.

2558. Do you think that the production of butter in Ireland is retarded by the cost of carriage to Limerick and any distances round Limerick?—I do not think it is.

2559. Do you think that the rates charged are such as to keep down the growth of corn in the districts round Limerick?—I do not know.

2560. Do you think that turf might be dug at some distance from Limerick and be brought into Limerick in greater quantities if the rates were less?—Yes.

2561. What reduction do you think would be necessary to give a stimulus to the digging of turf?—I suppose that the rate should be considerably lower than it is now.

2562. What district do you think would be chiefly stimulated?—The county of Limerick; and from Ennis turf could be brought, also from the district of Castleconnell, by the Castleconnell railway.

2563. Do you know of any commodity that would be carried into the interior in any considerably greater quantities than at the present time, if there was a considerable reduction in the rates of conveyance?—I daresay coals would be carried to a distance considerably further than they are at the present time.

2564. In what direction would they be carried?—In the direction of Nenagh, for instance, and Roscrea.

2565. Bearing in mind what you stated, that by the present rates Dublin and Waterford send goods too near to Limerick, do you think if there was a still greater reduction in the rates from those ports goods would be sent from Limerick to Roscrea, or from Dublin to Roscrea?—That is a longer distance; Roscrea is a greater distance from Dublin than from Limerick.

2566. Having mentioned the different rates to the different ports, Dublin, for example, as compared with Limerick, would not the effect of a reduction of the rates be to bring the coals from Dublin to Roscrea, and not from Limerick to Roscrea?—If there was a uniform mileage rate by the railways I think the difference in the freight to Dublin would still leave to Limerick an advantage by railway.

2567. Is there no turf in the neighbourhood of Roscrea?—A good deal of coal goes there.

2568. But are there no peat bogs in that neighbourhood?—Yes, there are some.

2569. Are they worked?—Yes, they are; but it is principally to Nenagh, and between Nenagh and Roscrea, that the coals go from Limerick.

2570. Is it high ground thereabouts, and free from bog, between Nenagh and Roscrea?—There is a good deal of bog there, there must be, but a certain quantity of house coals are carried there notwithstanding.

2571. Is that consumption of house coals, in your opinion, likely much to increase, or is it an article of luxury at the present time with which turf comes into competition?—The turf would come into competition with it when the price was moderate.

2572. (*Capt. Galton.*) Is there any cattle trade from Limerick?—Yes.

2573. A large cattle trade?—Yes.

2574. Do the cattle come by railway to Limerick, or do they walk into Limerick?—I am not conversant with the cattle trade, but I have heard them say that they preferred driving the cattle to paying the high charges.

2575. If the charges were lower do you think that the traffic would increase on the railways?—I think so.

2576. Is there any mineral produce anywhere near Limerick?—Very little.

2577. Are there any mines near Nenagh?—Not sending minerals into Limerick.

2578. Are there any mines of any sort?—Yes, but not sending into Limerick for shipping at present.

2579. (*Chairman.*) Is there any flax manufactured in Limerick?—Yes.

2580. In Limerick itself?—Yes.

2581. Is the produce of those manufactories increasing?—I do not think it is.

2582. Is any quantity of flax brought into Limerick by the railways?—Very little, I should say, by railway.

2583. (*Mr. Ayrton.*) Is there any great water power on the falls of the Shannon?—Yes.

2584. Is that utilized for any purpose of industry?—Very little.

2585. (*Chairman.*) Are those flax manufactories which you have mentioned worked by water or steam power?—They are worked by steam power.

2586. (*Mr. Ayrton.*) Is the water power on the Shannon so constant that it could be utilized without steam machinery in addition?—Yes, a great deal of it is constant; it is principally used for corn mills and flour mills.

2587. (*Chairman.*) Are there any suggestions that you wish to make to the Commission as to any improvements that could be introduced with respect to

Mr.
J. R. Tinsly.
17th May 1865.

Mr.
J. R. Tinsly.
7th May 1865.

the traffic on the Irish railways?—The only suggestion that I would make is, that I think if the different lines of railway were under one uniform management it would be a very great advantage.

2588. (*Mr. Glyn.*) Do you mean under one board?—Yes.

2589. To have all the Irish railways under one board?—Yes. I think it would be an advantage to have a Government board.

2590. On what grounds should you prefer a Government board?—I think that each locality would then have the advantage of having a board that would be independent of anything like local interest.

2591. (*Mr. Ayrton.*) Have you found any difficulty in booking through in Ireland, or is there any complaint in Limerick of any difficulty in booking goods through to the different ports of Ireland?—No, I am not aware that there is any difficulty in doing so.

2592. (*Chairman.*) Have you any trade with the north of Ireland?—Scarcely any.

2593. You are not in favour, I think, of competition as respects the railways?—I would be in favour of competition, but not of combination.

2594. Do you wish that all the railways should be amalgamated?—Yes, under a Government board, or such an independent board as would make equitable uniform rates, according to the mileage.

2595. Has it ever been in contemplation to take the railways at Limerick down to the wharves on the banks of the river?—It has been spoken of.

2596. At Waterford, I believe, the railway is in communication with the water?—At one side, I believe, it is close to it.

2597. (*Capt. Galton.*) With regard to the trains which run from Limerick to the junction line, do many of the trains correspond with the South Western down trains at the junction?—Yes, I believe they all correspond, with the exception of the mail train; it leaves at 11 o'clock, and it has to wait two hours.

2598. The only train that does not correspond is the mail train?—Yes.

2599. All the other trains do meet?—Yes, I believe so.

2600. (*Mr. Gower.*) You would then propose that a Government board should be constituted; by whom should the members of it be elected?—I suppose the Government would devise means for doing that.

2601. You would propose that the Government should name the board?—Yes.

2602. Would you have that board consider the interests of the railway companies or the interests of the public?—Of the public. I think that they should consider the interests of both to a certain extent; but I think that the interest of the public should be first consulted, both as to the number of trains required and the rates of charge.

2603. (*Lord Donoughmore.*) Supposing that the adoption of those alterations in the interests of the public were to result in a very serious diminution of the dividends to the shareholders, what should be done then?—I think that the rights of the shareholders should be preserved in any case.

2604. What do you conceive the rights of the shareholders to be; is it not to make as much money as they can out of the railway?—Yes, in proportion to what they are now making. I do not think that they are making a very large dividend just now. I daresay that the Government would deal with the shareholders in an equitable manner; but I cannot suggest the means of doing it.

2605. (*Mr. Ayrton.*) You think that the Government should buy up the railways and take them into their own hands?—To take the management as they may think proper to do.

2606. They could hardly undertake to manage any other person's property without their consent?—No, but to take it at a valuation.

2607. (*Capt. Galton.*) Having done that they would have to pay a certain sum to the shareholders to buy them out, and that sum must be borrowed or

obtained in some way and interest must be paid upon it?—Yes.

2608. Supposing that the working of a line resulted in a loss to some extent of its interest, how would you propose to meet that loss?—That is assuming a case that may not occur.

2609. You ought to provide against all contingencies in those arrangements, and suppose that a loss did occur, how would you meet the loss; ought there to be a general taxation in England, or ought it to be by local taxation in Ireland?—I should say that it should be a taxation in Great Britain, an imperial taxation.

2610. You would not have the railways managed on the principle that the expenses connected with them should be paid by the persons who used them?—I think that the expenses would be paid with proper management under a Government arrangement.

2611. Would you have them managed upon the principle that the expense of the railways should be defrayed by those who used them?—I think that that is a most equitable way.

2612. You would consider, I suppose, that part of the expense of a railway was the cost of making it?—Yes.

2613. Therefore you would propose that the Government board should so regulate the rates that they should return an interest upon the cost of making as well as upon the working charges?—Certainly. I do not wish it to be inferred that the present shareholders should be injured by the Government taking possession. I rather think that their rights should be preserved, but I think the public ought to have more convenience and lower charges.

2614. (*Mr. Glyn.*) Suppose the lower charges did not realize quite so much money as before, what would you do then for the shareholders?—That is a question that I can scarcely answer.

2615. (*Mr. Ayrton.*) Of course they must make such arrangements as would make it pay?—Yes.

2616. You would raise the rates again?—Yes, raise them moderately, without raising them so much, that it would leave a profit to the Government.

2617. At the present time you say there is scarcely any profit realized for the shareholders?—On some of the lines there is not.

2618. (*Mr. Hamilton.*) The Great Southern and Western line has paid a dividend as high as five per cent. for many years?—Yes; but the Waterford and Limerick line is not paying so well, nor the Ennis and Limerick. The Foynes and Limerick line is a very bad one.

2619. The fares on the Foynes and Limerick line are very low, are they not?—They are low.

2620. Lower than any other line in Ireland nearly?—I cannot exactly say; I have not travelled by that line.

2621. (*Mr. McClean.*) If the Government purchased the railways in Ireland, how would you provide for further extensions?—I daresay by an advance of Government money.

2622. (*Mr. Hamilton.*) Is it your opinion that if the fares were moderately reduced the traffic would sufficiently increase to enable the Government to meet all the charges, pay a reasonable dividend to the shareholders, besides paying the working expenses?—That is my opinion.

2623. (*Mr. Dalglisch.*) Do you not fancy that local government in a district would be better for the management of the railways than general management by the Government?—I do not quite understand the question.

2624. Would they not be more conversant with the interests of the place?—Government management would in my opinion be quite as good as any local directory.

2625. For instance, take all the railways south of that blue line on the map between Dublin and Galway and place them under local management, would not the persons having the management in that district

understand the wants of the district better than mere Government servants sent from England?—It does not follow, I think, that Government servants would be sent. Irishmen might be appointed.

2626. But the servants, whoever they were, must be under the control of the Government?—Yes.

2627. Would not persons belonging to the district understand the wants of the district better than any Government officer?—I do not think they would. I think that Government officials could be made as well acquainted with them as any local directorate. If I understand your question, it is whether a local directory would not manage and understand the requirements of the locality better than Government officials?

2628. Yes.—I do not know that they would.

2629. Supposing that a fair bargain was made with the railway proprietors of all the lines south of the blue line between Dublin and Galway, and that the whole management was placed under a board nominated in that part of Ireland by persons interested in railways, would not that be the best plan?—What power would the Government have over that board?

2630. They would have nothing to do with it. My question is, would not a board so appointed be better than a mere Government board?—I think that a Government board would do it quite as well and in some cases better, for they would have no local influence brought to bear upon them to induce them to make extreme charges at one place and lower charges at another.

2631. Why should the servants of a district have any local influence exercised over them?—It is natural, I think, that they would have.

2632. Why should they not be equally honest with Government officials?—You are talking of Government officials and not of directors.

2633. I am talking of the persons who are to manage a great amalgamation of railways. Suppose a board to be appointed by the people living south of that blue line to represent the interests of that district?—Then there must be shareholders who have an interest in the railways to appoint them.

2634. That does not follow.—If I understand you the Government are to appoint persons connected with the locality.

2635. No; the Government are to have nothing to do with the locality, they are to appoint their own people; and supposing an arrangement of that kind made, I wish to ascertain what your views are, whether the amalgamated railways would be better managed by a board appointed by persons living in the district, or by officials appointed by the Government?—I do not see what power the people living in a district would have to appoint a board unless they were shareholders and they had some interest in the matter.

2636. But I am supposing the board to be appointed.—Then I must say that I should prefer a board of Government officials, because I think they would be more responsible.

2637. Would it not be more fair to the country generally, if the railway system in Ireland is to be put under one control, to put it under the control of the people of the district, who might be assessed for any falling off in the receipts that might be realized by the working of the system?—How could you do that without taking the ownership out of the shareholders' hands?

2638. You must do that if the Government is to

The witness withdrew.

MR. MICHAEL ROBERT RYAN examined.

2651. (*Chairman.*) You are a merchant of Limerick?—Yes.

2652. Are you a member of the Chamber of Commerce in that city?—Yes.

2653. Have you had occasion to form any decided opinion as to the effect of the present rates charged upon the railways coming to Limerick?—Yes, I have.

work the lines. You say that an amalgamation of all the railways under the Government would be an immense advantage to Ireland?—Yes.

2639. I want to ascertain from you whether, if it became necessary to make some arrangement for the benefit of the district through which the railways to which I have called your attention run, and a board was appointed by the inhabitants of that district to manage those railways, whether they would not be better managed by a board so appointed than by Government officials?—Taking the question as I now understand it I do not think it would be so. I think the system could be quite as well managed by Government officials. I do not see why they should not be selected from persons in the locality as well as coming from a distance.

2640. Supposing that to be done and the system was managed for the benefit of the people, do you imagine that the locality would be content to be assessed for any loss that might arise?—I do not think it would. I think that if once the Government took the management of the railways into their hands they would be responsible for any loss, if there should be any.

2641. Although under their management, with the proviso that the railways should be managed entirely for the benefit of the people in the district?—The management, of course, would be for the benefit of the people.

2642. Do you not think that it would be very likely to lead to this, if the Government assumed any such power over the railways in a particular district, that whenever an election came on the people in the district would say, "You did not do what we wanted you to do, and unless you do that we will have you out?"—I do not know that it would have any effect upon the election at all. I do not see any effect that it could have.

2643. You do not think that it would be made a handle of?—I do not think it would.

2644. (*Chairman.*) You do not think that the people of Limerick would be willing to be assessed in order to make up any temporary deficiency that might arise by a general lowering of the rates on the railways running into the town?—No, they would not.

2645. Would they rather go on with their present rates than incur the liability of having to make up any deficiency?—Certainly.

2646. (*Lord Donoughmore.*) What do you think the country gentlemen would say of having a tax put upon them to compensate for any deficiency arising from lowering the rates?—I do not think that any portion of the inhabitants would like it, but I do not assume that such would be the effect of a reduction in the rates; I assume the contrary.

2647. (*Chairman.*) You think they would not like to run the risk of it?—Yes.

2648. And that they would rather go on with the present scale of charges than run any risk of that kind?—I think so.
